Bolton, or BOLTON-LE-MOORS, an important English manufacturing town and parliamentary and municipal borough in South Lancashire, on the Croal, 11 miles NW. of Manchester. The river Croal divides the town into Great and Little Bolton. It was celebrated as far back as the time of Henry VIII. for its cotton and its woollen manufactures, introduced by Flemish clothiers in the 14th century. Emigrants from France and the Palatinate of the Rhine subsequently introduced new branches of manufacture; and the improvements in cotton-spinning of the middle of the 18th century rapidly increased the trade of the town. Though Arkwright was at one time a resident, and Crompton was born and all his life lived in the parish of Bolton, the opposition of the working-classes long retarded the adoption, in the town, of their inventions—the spinning-frame and the mule. Bolton, containing more than 100 cotton-mills, with about 4 million of spindles, is now one of the principal seats of the cotton manufacture in Lancashire. Muslins, fine calicoes, quiltings, counterpanes, dimities, &c. are manufactured. There are also extensive foundries and iron-works, bleaching-mills, chemical works, paper-mills, and numerous dye-works. Bolton parish has numerous coal-mines. There are public reference and lending libraries and museum, town cemeteries, public park and recreation grounds, town-hall, which cost in all £170,250, opened in 1873, market-hall, fish-market, exchange, mechanics' institute, and many churches and schools. The cost of bringing the water from Entwisle Moor, a distance of 5 miles, was, up till 1887, £766,270. Bolton is an important railway centre, being a principal station on the London and North-western and the Lancashire and Yorkshire railways. It is the birthplace of the daily evening press (*Bolton Evening News*), and has now three evening and three weekly newspapers. During the Civil War, the Parliament garrisoned Bolton; in 1644 it was stormed by the Earl of Derby. A canal was made from Manchester in 1791. Pop. (1871) 92,655; (1881) 105,973; (1891) 115,002. Since 1832 it returns two members to parliament.

Bolton Abbey, Yorkshire, is situated in a highly picturesque district on the river Wharfe, 6 miles E. of Skipton, and 21 NW. of Leeds. Founded for Augustinian canons about 1150, it has been celebrated by Wordsworth in *The White Doe of Rylstone* and *The Force of Prayer*. The remains range from Early English to Perpendicular; and the nave of the church has been restored

for service. The old barn of the abbey is still in use; and the gateway, familiar through Landseer's picture, has been incorporated in Bolton Hall, a modern seat of the Duke of Devonshire.

Bolus (Gr. *bolos*, 'a lump'), a soft mass of any kind of medicine, intended to be swallowed at once. It differs from a pill in being larger.

Boma, the capital of the Congo State (q.v.).

Bo'marsund, a Russian fortress on Aland Island (q.v.), commanding the Gulf of Bothnia. In August 1854 it was destroyed by an Anglo-French force, after a six days' bombardment. The Treaty of Paris bound Russia not to restore it.

Bomb, BOMB-SHELL, or SHELL, is a hollow projectile, usually of cast iron, fired from a mortar or other large piece of ordnance, filled with gunpowder, and fitted with a time-fuse, which causes it to burst at any required instant after it is fired. The fragments are most destructive both to men and material, and the flame of the explosion sets fire to anything inflammable with which it comes into contact—even earthen parapets are much damaged by bombs, which, lodging in them and then bursting, have the same effects as a mine sprung under them. Such projectiles were formerly fired from mortars only; but all modern pieces of artillery now fire them. The name *shell* has, however, been generally substituted for that of *bomb*, especially since the introduction of rifled guns firing elongated projectiles. The largest spherical bomb ever made is 26 inches in diameter and weighs 21 cwt., for Mallet's gigantic mortar, now in Woolwich Arsenal, but only a few were ever fired, as the mortar was found to be too weak to bear the shock of discharge. The 13-inch is the largest spherical shell in ordinary use. It weighs about 195 lb., with a thickness of metal varying from 1½ to 2 inches at different parts; it bursts with about 8 lb. of powder. The 10-inch bomb, weighing about 90 lb., is proportionately less in all dimensions than that just described. The smallest is the one-pounder shell of the 'pom-pom' machine gun. The elongated projectiles used with modern heavy guns, some weighing as much as three-quarters of a ton, are all hollow. See SHELL, MORTAR, INFERNAL MACHINES, MACHINE GUN.

Bomba was an opprobrious epithet bestowed in Italy on Ferdinand II. of Naples (1810–59), in consequence of his cruel bombardment of Naples, Messina, and other cities of his realm during the revolutionary troubles of 1849.

Bom'bard, a kind of cannon in use about the close of the 14th century and later, short, thick, and wide in the bore, sometimes capable of throwing balls of stone of 200 and even 500 lb. weight.

Bombardier, the lowest non-commissioned officer in the British artillery, ranking with corporals in the infantry and cavalry. The name was applied in the 17th and 18th centuries to a man employed about the mortars and howitzers—pieces of ordnance employed in bombarding.

Bombardier Beetle, a name given to several species of beetles, of the genera *Brachinus* and *Aptinus*, in the sub-family Carabidae. The name refers to their offensive and defensive habit of discharging an acrid volatile fluid with explosive force from the abdomen. Some ants and other insects exhibit the same curious protective device. The discharge has a pungent odour, acid and caustic properties, and evaporates with effervescence in the air. These beetles are usually found under stones or at tree roots, often in great companies. The larger and more brilliant species are tropical. Several small species of *Brachinus* are natives of England. The most common English species is only about four lines long. When

roughly handled, it will make more than a dozen discharges in rapid succession.

Bombardment is an attack upon a fortress or fortified town by means of shells, red-hot shot, carcasses, rockets, &c., to destroy the fortifications, burn the houses, and kill the people. It is most likely to be successful against a place destitute of bomb-proof cover; or one having a large civil population. A bombardment is a cruel operation, especially when, as is often the case, it is directed against the civilians and their buildings, as a means of inducing or compelling the governor to surrender the place, and terminate their miseries. It requires little engineering science; whereas a regular siege, which is a much slower process, requires the aid of engineers to direct the attack against fortifications, guns, and soldiery, leaving the inhabitants and buildings untouched. In modern times, a bombardment is generally adopted as an adjunct to a siege, distracting the garrison by an incessant fire from mortars and heavy guns day and night. At Sebastopol, for instance, the mortars fired shells into the centre of the city, while the forts were cannonaded by the siege-guns. A bombardment is more frequently a naval than a military operation, and in that case is undertaken without an investment, or any intention of capturing the place, but simply with the object of destroying it. The stores required for a vigorous bombardment are immense. Thus, in 1759 Rodney threw 20,000 shells and carcasses into Havre; in 1792 the Duke of Saxe-Teschen threw 36,000 shot and shell into Lille in 140 hours; in 1795 Pichegru threw 8000 shells into Mannheim in 16 hours; and in 1807 the English threw 11,000 shot and shell into Copenhagen in 3 days. In January 1871 the Germans, bombarding Paris and its forts, threw 10,000 shells daily into the place, of which 500 fell in the city itself. The siege and bombardment of Strasburg in August and September is also memorable. The bombardment of the forts of Alexandria by the British fleet on the 11th July 1882, is a recent example of the effect of the enormous modern shells. It was directed against the fortifications with the intention of destroying them, and not against the town, though the latter was set on fire in several places by these far-ranging projectiles. The forts were silenced in 24 hours.

Bombardon, in Music. See SAXHORN.

Bombax. See SILK-COTTON TREE.

Bombay, the Western Province of India, with a Governor appointed by the crown, a Legislative Council, and a European and native garrison under a local Commander-in-chief. Bombay, including Sind and Aden (q.v.), comprises 24 British districts, and 19 native or feudatory states, and contains 197,887 sq. m., of which 73,753 are in native states. The Nerbudda River divides the presidency, as in accordance with the old name it is still often called (see INDIA), into two portions: in the north is Guzerat, chiefly consisting of alluvial plains, with the Cutch and Kathiawar peninsulas; to the south is the Mahratta country, which includes parts of the Deccan, Carnatic, and Konkan or coast-districts. The political control of Baroda (q.v.) was transferred in 1875 from Bombay to the supreme government of India. The small territories of the Portuguese—Goa, Daman, and Diu—have an area of 1062 sq. m. The coast-line is irregular, broken by the gulfs of Cambay and Cutch, with several fine natural harbours, Bombay and Karachi (Kurrachee) being the most important. The chief mountain-ranges run north and south; in the north are the Kirthar Mountains; in the south-east are the Western Aravalli range; south of the Tapti are the Sahyadri Mountains or Western Ghats, which run almost parallel with the coast;

the Satpura range runs east, and forms the watershed between the Tapti and Nerbudda. Sind is watered and fertilised throughout its whole length by the Indus; the Subarnati and Mahi flow through the plains of North Guzerat; the Nerbudda pursues a western course into the Gulf of Cambay. The Tapti flows through Khandesh district, entering the sea above Surat. Besides these, there are numerous hill streams, which are torrents during the rains and dry up in the hot season. The Runn of Cutch (q.v.), in the west of Guzerat, covers an area of about 8000 sq. m., and is the great source of salt-supply for the presidency. There are few minerals, and no coal; iron is mined at Teagar in Dharvar, and there is gold amongst the quartz. Good building-stone is abundant, with limestone and slate. As to climate: in the dry sandy districts of Sind, the thermometer has reached 130° in the shade; the mean temperature in Lower Sind, during the hottest months in the year, is 98° in the shade. In Cutch and Guzerat the heat is slightly less. The average rainfall is 70 inches. The coast-districts are hot and moist, with a heavy rainfall. The tableland of the Deccan has an agreeable climate, except during the hot months.

The principal agricultural products are millet, legumes, rice, wheat, cotton, oil-seeds, tobacco, indigo, cane-sugar, &c. The languages spoken are Marathi and Canarese in the south, Gujarati in the north-west, Sindi in Sind, and west of the Indus Baluchi. Of 80 newspapers 30 appear in Marathi, and almost as many in Gujarati. The University of Bombay was founded in 1887; there are five colleges in the presidency, and some 12,000 schools, with 620,500 pupils (70,000 females). For the government of the presidency, see INDIA. Besides an Anglican bishop and his clergy, there are chaplains of the Church of Scotland. During the Mutiny of 1857 the local army remained, on the whole, faithful. Poona is the military centre. Bombay has benefited vastly from the establishment and extension of the Indian railway-system. The first railway in India was opened in Bombay in 1853; the presidency has now more than 3500 miles of railway, giving communication with all the important towns of India. A cable telegraph from Bombay to Aden was laid in 1869; there are now private company cables, while the Government Indo-European Telegraph Department has its headquarters at Karachi.

Of late years, manufacturing industries have been extremely active in Bombay. Commanding the richest cotton-fields in India, it has improved to the utmost its natural advantages. The stoppage of the American cotton-supply during the civil war gave a grand impulse to the Bombay trade, the exports of cotton during the five years 1861 to 1866 averaging in value £21,582,847 a year. The wealth poured into Bombay at this period led to a vast extension of the trade, which partly continued after the period of inflation had passed. The first mill was started in 1854, and ten years later there were 13. In 1887 there were 75 factories; and in 1891 there were 89, with 18,192 looms and 2,330,468 spindles. There is still a large but decreasing import of cotton goods from England, but though, on account of currency and other difficulties, the cotton trade was greatly depressed in 1892-93, Bombay not merely competes with Manchester in the Indian markets, but largely exports its own manufactures. The town of Bombay is naturally the chief centre of the cotton manufacture, as it is the place whence cotton and cotton goods are exported. For Indian cotton-growing and cotton-manufacturing, see also Vol. III. pp. 509 and 515. The rapid growth and present condition of the cotton industry is the more striking

in view of the abolition, in 1881, of the duty on cotton imports, which placed the local industry

even the most crowded parts. Many of the private houses of European residents are built on the

Cotton Merchants at Bombay.

at a disadvantage. After cotton, the other great staples are opium, wheat, and seeds. The trade in opium is worth nearly five millions sterling, two millions being the clear revenue derived by government from a pass duty of 550 rupees a chest. Although of recent origin, the wheat trade has assumed large proportions; the exports in some years have had a value of over £6,000,000. Other principal exports are sugar, tea, raw wool, woollen shawls, fibres, and drugs; while among the imports are machinery, metals, oils, coal, and liquors. Silk-weaving is carried on at Ahmedabad, Surat, Nasik, Yeola, and Poona; carpets are made at Ahmednagar; leather-work and pottery in Sind; brassware in Bombay city, Nasik, and Poona; cutlery, armour, and gold and silver work in Cutch.—In the year 1891-92 the total imports had a value of £36,776,556, including over £11,000,000 of treasure, about two-thirds being from Great Britain; while the exports had a value of £43,307,113, including £2,600,000 of treasure, of which total some £10,000,000 were sent to Britain.

The population of the presidency (including Aden, Sind, and Perim) in 1891 was in the native states 8,059,298; and in British territory 18,901,123, of whom 14,659,926 were Hindus, 3,537,503 Mohammedans, 1,240,436 Jains, 213,618 of aboriginal faiths, and 161,770 Christians.

Bombay (City) occupies the entire breadth of the S.E. end of Bombay Island or Peninsula, bordering at once on the harbour inside, and on Back Bay outside. The island, now permanently connected by causeways and breakwaters with Salsette Island and the mainland, is over 11 miles long by from 3 to 4 broad. For administrative purposes the city constitutes a district by itself, with an area of 22 sq. m. Its harbour, studded with islands and crowded with shipping, is one of the finest in the world; the space available for shipping being about 14 miles in length by 5 broad. Bombay is the most European in appearance of all the cities in India. In the business part there are several streets continuously lined with splendid buildings; while the bazaars, which extend from the fort towards Mazagaon, are traversed by fairly wide streets, extensive lines of tramways passing through

sailors' home, and statue of the Queen. In the neighbourhood of the fort are the town-hall, the mint, cathedral, and custom-house. The terminus of the Great Indian Peninsular Railway, opened in 1876, is the finest building in Bombay—probably the finest structure of the kind in the world, costing upwards of £300,000. On the promontory to the east of Back Bay stood the old

fort, now a mere garrison, its walls having been demolished; the harbour is defended by batteries and two ironclads. It has an extensive system of quays, wharves, and docks, including Princes Dock (1879), which cost over a million sterling, and Victoria Dock (1889). Mazagaon Bay, the centre of shipping activity, is at the head of the harbour. The city water-supply is, since 1892, drawn from Tansa Lake (q.v.), 65 miles N. Always favourably situated for foreign trade, Bombay has profited largely by being the first important port reached by vessels from Europe, and by being the

chief mail line to India by Suez and Aden, whence letters are sent on by rail to all parts of India. Bombay now surpasses Calcutta in the amount of her trade; whereas some 35 per cent. of the trade of India is done through Calcutta, over 40 per cent. is done through Bombay. This proportion is partly accounted for by the fact that the bulk of the treasure imports to India are received in Bombay. The chief articles of export are cotton, wheat, shawls, opium, coffee, pepper, ivory, and gums; the chief imports, piece-goods, thread, yarn, metals, wine, beer, tea, and silk. The chief industries are dyeing, tanning, and working in metal. With 70 large steam-mills, Bombay presents the appearance of a city in Lancashire. The population, which is exceedingly heterogeneous and dense, amounted, in 1881, to 773,196, and in 1891, to 821,764. Some 13,000 are British born.

In 1509, about a year before the capture of Goa, the Portuguese visited the island; and by 1532 they had made it their own. In 1661 they ceded it to Charles II. of England, as part of the dowry of his bride, the Infanta Catharine. In 1668 his majesty granted it for an annual payment of £10 to the East India Company, which, in 1685, transferred what was then its principal presidency to Bombay from Surat. The name of the island, styled Maumbi by the Portuguese of the 16th century, is said to be derived from the goddess Munba-devi; Colonel Yule has traced it back to Mayanba, the name of the Konkani kingdom in the 16th century. The bay towards the mainland is one of the finest havens in India. Among the numerous islands are Elephanta (q.v.) and Salsette. An appalling and continued visitation of the bubonic plague killed 28,418 persons in 139 days of 1896-97, 28,869 in 115 days of 1898, 31,260 in 131 days of 1899, and 50,383 between November 1899 and April 1900. Vast numbers of the inhabitants fled from the city, and trade and commerce were wholly disorganised. Bombay is the birth-place of Jejeebhoy, Monier Williams, Dean Farrar, and Rudyard Kipling.

See Maclean's *Bombay* (1876); Eastwick's *Handbook* (21 ed. 1881); and Hunter's *Bombay*, 1885-90 (1892).

Bombay Duck, or BEMMALOTI (*Saurus ophiodon*), a fish of the family Scopolidae, nearly allied to the salmon and trout family. It is a small but voracious fish of elongated form, with large fins and a very large mouth, the gape of which extends far behind the eyes, and which is furnished with a great number of long, slender teeth, barbed at the points. It is a native of the coasts of India, particularly of the Bombay and Malabar regions, from which it is exported in large quantities, salted and dried, to other parts of India and elsewhere, being highly esteemed for its rich flavour, and often used as a relish.

Bombazine is a cloth for dresses, in which the distinguishing characteristic is that the warp is silk and the weft worsted. The cloth has thus a bare look. It is rather fine and light in the make, and may be of any colour. The fabric is now little used. It was extensively made, and chiefly at Norwich, from about 1816.

Bomb-proofs are military structures of such immense thickness and strength that shells cannot penetrate them. In every fort, the barracks, hospital, stores, and magazines are covered with masonry and earth, or even, in some cases, with thick armour-plates, so as to be impervious to the fire of the most powerful siege-guns and mortars. See CASEMATE, and MAGAZINE.

Bombyx. See SILKWORM.

Bommel, a town in the Dutch province of Gelderland, on the Waal, 20 miles SSE. of Utrecht. Population, 3980.—The Bommelerwaard is a fertile

island-district (16 by 6 miles), formed by the Waal and Maas.

Bona (Fr. *Bône*), a seaport town of Algeria, in the province of Constantine, situated on a bay of the Mediterranean, near the mouth of the Sebus, 220 miles W. of Tunis by rail. The town, divided into two parts, Upper and Lower Bona, is situated in a beautiful but unhealthy district at the foot of a hill, and is defended by a citadel and several forts. Since the occupation of Bona by the French in 1832, the town has been much improved, and has good bazaars, shops, markets, reading-rooms, &c.; manufactures of tapestry, saddlery, and native clothing; and a trade in wool, hides, corn, coral, and wax. The exposed roadstead has been made into a fair harbour. There are iron and copper mines near Bona. A telegraph cable was laid between Bona and Marseilles in 1870. Among the public buildings, the Catholic church and the convent of the Sisters of Mercy are most remarkable. Near Bona are some scanty remains of the once famous city, Hippo Regius, a centre of commerce and civilisation in North Africa destroyed by Calif Osman in 646, the favourite residence of the Numidian kings, and the episcopal seat of St Augustine, who died here in 430. Conspicuous on a hill-top above the site of Hippo is the great basilica of St Augustine, inaugurated in April 1900. Pop. (1900) 32,500.

Bona is law-Latin for goods, and occurs in the Scottish legal phrase *in bonis*—i.e. forming part of the legal estate—and in the Roman phrase *bonorum possessio*. In English law the word has some technical applications: *Bona Vacantia*—such as wrecks, treasure-trove, waifs, and estrays, contrary to the general rule, which gives such things to the finder—vest in the crown; *Bona Fidei* consist of goods waived or thrown away by a thief in his flight, for fear of being apprehended; they belong to the owner if he prosecutes to conviction, otherwise to the crown. In cases of outlawry, the property forfeited to the crown is sometimes called *Bona Confiscata*.

Bona Dea ('the good goddess'), a mysterious Italian goddess of fertility, who is variously described as the wife, sister, or daughter of Faunus. She was worshipped at Rome from the most ancient times, but only by women, even her name being concealed from men. Her sanctuary was a grotto on Mons Aventinus; but her festival (the 1st of May) was celebrated in the house of the consul. The solemnities were performed generally by high-born vestals. At this celebration, no males were allowed to be present; even portraits of men were veiled. During the celebration in the house of Caesar (62 B.C.), the infamous Clodius was discovered disguised as a female musician. The symbol of the goddess was a serpent, indicating her healing powers.

Bona Fides, a Latin expression signifying good faith, enters as a legal doctrine largely into the consideration of matters of agreement, contract, damage, trusts, and other departments of the law; and in all of them it requires the absence of fraud, or unfair dealing. This term, however, does not appear to occupy any formal or technical place in the law of England. It is the foundation of many just and enlightened maxims in the Roman jurisprudence, which in this respect, as in many others, has been followed by the legal system of Scotland. In the law of that country, a person who possesses and enjoys property upon a title which he honestly believes to be good, although it may be bad, is protected against the consequences of this illegal position, and he is entitled to retain the fruits or profits which he has reaped or received during his *bona-fide* occupancy. But

this protection ends when the possessor becomes aware of the insufficiency of his title, whether by private knowledge or otherwise. This rule, which is largely founded on the negligence of the true owner, would extend to a claim for interest on money erroneously paid to a person honestly believing himself the creditor. In the Scots law, again, while honest belief will not render valid a second marriage, the first subsisting, it would, it is thought, have the effect of rendering the children of such second or putative marriage *legitimate*, and would even confer rights of succession on the innocent husband or wife. The law of England is not so indulgent, for there children born under such circumstances would certainly be deemed bastards. As a general rule, parties are supposed to contract at arm's length, and therefore there is not much room for the doctrine of *bona fides* in considering business agreements, which depend on the true construction of the documents exchanged. Positive misrepresentation or fraud will of course upset a contract if it led to error, but it is only in certain classes of contracts, such as partnership, suretyship, insurance, &c., that the plea of undue concealment has much force. The amount of damages recovered is sometimes affected by the good or bad faith of the wrongdoer, as in the case of wilful trespass of mining boundaries, where the nature of the subject renders a severe check necessary. In trust administration the beneficiaries are entitled to place much confidence in the trustees, and bad faith on their part is severely dealt with. See BASTARDS, BASTARDY; and see on the subject of this article generally, CONTRACT, DAMAGE, EXECUTOR, GUARDIAN, MARRIAGE, TRUSTEE.

The interpretation of the term *Bona-fide Traveller* has given no little trouble to the magistrates of Scotland in reference to the famous 'Forbes Mackenzie Act' (q.v.).

Bonaire. See BUEN AYRE.

Bonald, LOUIS GABRIEL AMBROISE, VICOMTE DE, a French publicist, born in 1753 at Monna, in Aveyron, was compelled to emigrate during the French Revolution, and employed his pen at Heidelberg on behalf of monarchy. His first important work, *Théorie du Pouvoir Politique et Religieux* (3 vols. 1796), was seized by the Directory. It prophesied the restoration of the Bourbons. Having returned to France, he was in 1808 appointed by Napoleon Minister of Instruction. In 1815 he voted with the Ultramontane party, and ever after displayed a marked hostility to the freedom of the press, and all projects of electoral reform. Raised to the peerage by Louis XVIII. in 1823, he retired, under the next dynasty, to Monna, where he died 23d November 1840. His most important writings are: *Législation Primitive* (3 vols. 1802), and *Recherches Philosophiques* (2 vols. 1818), which have been immensely applauded by his own party, but are most remarkable for weak logic, historical inaccuracy, and unreasonable devotion to the pope and the Jesuits. A complete edition of his works in 12 volumes was published under his own supervision (1817-19).—His son, LOUIS JACQUES MAURICE (1787-1870), became Archbishop of Lyons in 1839, and a cardinal in 1841.

Bonanza (Span., 'a fair wind,' 'prosperity'), a term originally applied in the mining territories of the United States to the discovery of a rich vein or 'pocket'; a mine was said to be *in bonanza* when producing profitable ore. It has since been used colloquially of farms where steam is employed, or of successful enterprises generally, in the sense of a 'mine of wealth.'

Bonaparte (pronounced in Ital. in four syllables; in Fr. and Eng. in three) is the name of a

famous family, and was spelt *Buonaparte* by the Emperor Napoleon and his father till 1796, though the more usual modern form also occurs in old Italian documents. In the 13th century and afterwards, several families named Bonaparte figure with distinction in Italian records—at Florence, San Miniato, Sarzano, and Genoa. But as the name of Bonaparte occurs in Corsica so early as the 10th century, it is probable that the island may have been their original home. In the 16th century we again find mention of the Bonapartes in Corsica, where in Ajaccio they occupied a respectable position as a patrician or leading family. In the 18th century this family was represented by three male descendants, all residing at Ajaccio: the archdeacon, Lucien Bonaparte; his brother, Napoleon Bonaparte; and their nephew, Charles.—CHARLES BONAPARTE, father of the Emperor Napoleon, was born at Ajaccio in 1746; studied law at Pisa; and married in 1767—without the consent of his uncles—a beautiful young patrician lady, named Letizia Ramolino. In 1768 he removed with his family to Corte, in order to assist General Paoli in defending the island against the French invasion. As the French prevailed, and further resistance was useless, Charles Bonaparte attached himself to the French interest, and in 1771 was included by Louis XV. in the election of 400 Corsican families to form a nobility. In 1773 Charles Bonaparte was appointed royal counsellor and assessor of the town and province of Ajaccio. In 1777 he was a member of the deputation of Corsican nobles to the court of France. In this capacity he resided for some time in Paris, where he gained for his son Napoleon, through the interest of Count Marboeuf, a free admission into the military school at Brienne. In 1779 he returned to Corsica, and in 1785 went to Montpellier for the benefit of his health, where he died the same year. He was a man of noble presence and amiable character. By his marriage with Letizia he left eight children: Joseph Bonaparte, king of Spain; Napoleon (q.v.), emperor of the French; Lucien Bonaparte, Prince of Canino; Maria Anna (afterwards named Elise), Princess of Lucca and Piombino, wife of Prince Bacciochi; Louis Bonaparte, king of Holland; Carlotta (afterwards named Marie Pauline); Princess Borghese Annunziata (afterwards named Caroline), wife of General Leclerc, afterwards of Murat, king of Naples; Jerome Bonaparte, king of Westphalia. These members of the Bonaparte family, with the children of Beauharnais (q.v.), adopted by the Emperor Napoleon when he married Josephine, are distinguished as the *Napoleonide* of modern French history. By a decree of the Senate (1804), the right of succession to the throne was restricted to Napoleon and his brothers Joseph and Louis, with their offspring. Lucien and Jerome were excluded on account of their unequal marriages. As Joseph, the eldest brother of the emperor, had no son, the descendants of Louis became nearest heirs to the throne.—MARIA LETIZIA RAMOLINO, mother of Napoleon I., lived to see her family placed on the thrones of Europe, and also witnessed their downfall. She was born at Ajaccio in 1750. After the death of her husband she lived for some time in Corsica, and in 1793, when the island came under British rule, removed with her family to Marseilles, where she lived in poverty, mainly supported by the pension given to Corsican refugees. After her son became First Consul she removed to Paris, and when her son was crowned in 1804 received the title Madame Mère, and was made patroness of all the benevolent institutions of the empire. A brilliant court-household was given to her, which, however, was never pleasing to her modest tastes.

Remembering former adversities, and foreboding reverses of the splendid success of her sons, she was prepared for all that followed. After the downfall of Napoleon, Letizia lived with her step-brother, Cardinal Fesch, in winter at Rome, and in summer at Albano, and submitted to her change of fortune with remarkable dignity. She died in 1836, leaving a considerable property, the result of saving habits during her prosperity.

JOSEPH BONAPARTE, eldest brother of Napoleon, was born at Corte, in Corsica, in 1768. On the death of his father he exerted himself to support the younger members of the family, and in 1793 removed with them to Marseilles, where he prepared for the bar. In 1797 he was elected a member of the Council of Five Hundred, and in the same year was sent as ambassador from the republic to Rome. In 1800, after he had proved his ability in several offices of state, he was chosen by the First Consul as plenipotentiary to conclude a treaty of friendship with the United States of America. He signed the treaty of peace at Lunéville 1801, and that of Amiens 1802; and with Cretet and Bernier conducted the negotiations relative to the *concordat*. After the coronation of Napoleon new honours fell to the share of Joseph Bonaparte, who was made commander-in-chief of the army of Naples; in 1805, ruler of the Two Sicilies; and in 1806, king of Naples. Though, during his reign, many beneficial changes of government were effected, these reforms were not managed judiciously; and his humane feelings brought him into frequent collision with his imperious brother, a fact which did not conduce to the efficiency of his rule. In truth, he was far too fond of the fine arts to be a vigorous ruler in stormy times; and he is accused of leaving affairs too much in the hands of his minister, the subtle Salicetti. In 1808 Joseph Bonaparte was summarily transferred by his brother to the throne of Spain, and Murat took his place as king of Naples. For Joseph, this was no favourable change; he found himself unprepared to cope with the Spanish insurgents, and after the defeat of the French at Vitoria in 1813, he returned to his estate at Morfontaine, in France.

After the battle of Waterloo he accompanied Napoleon to Rochefort, whence they intended to sail separately for North America. In his last interview with Napoleon, Joseph generously offered to give up the vessel hired for his own escape, but meanwhile Napoleon had determined to surrender himself into the hands of the English. Joseph became an American citizen, and lived for some years at Bordentown, in New Jersey, U.S., where he employed himself in agriculture, and was highly esteemed by his neighbours. In 1832 he returned to Europe, and he died at Florence in 1844. Joseph was the only one of his brothers for whom Napoleon professed to care anything. He was a handsome, intelligent-looking man, distinguished by the elegance of his manners and conversation.—His wife, JULIA MARIE CLARY, born 1777, was the daughter of a wealthy citizen of Marseilles, and the sister-in-law of Bernadotte, king of Sweden. She was a quiet unambitious woman, with no taste for the splendours of royalty which fell to her share during a few weeks only at Naples, for she never went to Spain. Ill-health appears to have prevented her accompanying her husband to America. She died at Florence in 1845. By her marriage with Joseph Bonaparte she had two daughters.

LUCIEN BONAPARTE, Prince of Canino, and brother of Napoleon, was born at Ajaccio in 1775, and received his education in the college of Autun, the military school at Brienne, and the seminary at Aix. In 1798 he was made a member of the

Council of Five Hundred, and formed a party favourable to the views of his brother Napoleon. Shortly before the 18th Brumaire he was elected president of the Council of Five Hundred, and was the hero of that day. During the ferment which followed Napoleon's entrance, Lucien left his seat, mounted his horse, and riding through the ranks of the assembled troops, called upon them to rescue their general from assassins. Afterwards appointed Minister of the Interior, he was active in the encouragement of education, art, and science, and organised the prefectures. As ambassador to Madrid (1800) he contrived to gain the confidence of King Charles IV. and his favourite Godoy, and to undermine the British influence, which had until then been exercised at the court of Spain. Lucien was a republican in opinion, and therefore opposed to the absolute rule of his brother; and his second marriage to the widow of a stockbroker did not improve their relations. On condition that he would divorce his wife, the crowns of Italy and Spain were offered him; but he refused them, and preferred living in retirement at his estate of Canino, in the province of Viterbo, near the frontiers of Tuscany, where he devoted his time to art and science. Here he enjoyed the friendship of the pope, who created him Prince of Canino and Musignano; but having denounced in his private capacity the arrogant and cruel policy of his brother towards the court of Rome, he was 'advised' to leave the city in which he was at that period residing. In 1810 he took ship for America, but fell into the hands of the English. After the defeat at Waterloo, Lucien Bonaparte alone seems to have preserved his presence of mind. He immediately advised his brother to dissolve the chambers, and assume the place of absolute dictator. After the second ascent of the throne by Louis XVIII., Lucien lived in and near Rome, and died at Viterbo in 1840. He possessed considerable talents and firmness of character. He was in his early years a keen republican, but the weakness of the Directory convinced him that a military consulship was necessary to allay the social anarchy of France. He wrote poems of no particular merit. Lucien had a numerous family. By his first wife he had only two daughters. See Jung, *Lucien Bonaparte et ses Mémoires* (3 vols. 1882-83).

His eldest son was CHARLES LUCIEN JULES LAURENT BONAPARTE, Prince of Canino and Musignano, born at Paris in 1803. He never exhibited any inclination for political life, preferring the more quiet and wholesome pursuits of literature and science. He acquired a considerable reputation as a naturalist, and especially as a writer on ornithology. He died in 1857. He was a member of the principal academies of Europe and America. His chief publications are a continuation of Wilson's *Ornithology of America*, and the *Iconografia della Fauna Italiana*.—The second son, PAUL MARIE BONAPARTE, born in 1808, took a part in the Greek war of liberation, and died by the accidental discharge of a pistol in 1827.—The third son, LOUIS LUCIEN BONAPARTE, born in 1813, at Thorngrove, Worcestershire, during his father's imprisonment in England, early devoted himself with equal ardour to chemistry, mineralogy, and the study of languages, and became an authority of the first rank in Basque, Celtic, and comparative philology generally. His election for Corsica in 1848 was annulled, but he was sent to the Constituent Assembly for the Seine department next year, and was made senator in 1852, with the title of highness in addition to that of prince which he already possessed from his birth. Most of his contributions to linguistic science have been privately printed, and, according to a *Catalogue* (8 parts, 1858-88), the total number of separate

books written either by himself or at his instigation and encouragement, amounted to no less than two hundred and twenty-two. Amongst these are a translation of St Matthew's version of the parable of the sower into *seventy-two* languages and dialects of Europe (1857); a linguistic map of the seven Basque provinces, showing the delimitation of the 'Euscara' and its division into dialects, sub-dialects, and varieties (1863); a Basque version of the Bible in the Labourdin dialect (1865); a masterly treatise on the Basque verb (1869); besides many papers in the philological journals. Under his patronage from 1858 to 1860 a version of the Song of Solomon was produced in twenty-two English dialects, besides four in Lowland Scotch. For long he lived in England, where a Civil List pension of £250 was granted to him in 1883. He died at Fano, on the Adriatic, 3d November 1891.—The fourth son, PIERRE NAPOLEON BONAPARTE, born in 1815, passed through many changes of fortune in America, Italy, and Belgium, and returned to France in 1848. In 1870 he shot a journalist, Victor Noir, a deed which created great excitement in Paris; and being tried, was acquitted of the charge of murder, but condemned to pay £1000 to Victor Noir's relatives. He died in 1881.—The youngest son, ANTOINE BONAPARTE, born in 1816, fled to America after an affair with the papal troops in 1836, and returned to France in 1848, where he was elected to the National Assembly in 1849; he died in 1883.

LOUIS BONAPARTE, third brother of Napoleon, born in 1778, was educated in the artillery school at Chalons, where he imbibed anti-republican principles. After rising from one honour to another he was made king of Holland in 1806; but, in fact, was never more than a French governor of Holland, subordinate to the will of his brother. Yet he seems to have done his best to govern in the interests of his Dutch subjects, and when he found his efforts useless, he resigned in favour of his son in 1810. He returned to Paris in 1814, where he was coldly received by the emperor. After living for some years in Rome—where he separated from his wife—he removed in 1826 to Florence, where he lived in retirement. He died at Leghorn in 1846. Louis Bonaparte was the writer of several works: *Marie, ou les Hollandaises* (1814), a novel, giving sketches of Dutch manners; *Documents Historiques, &c. sur le Gouvernement de la Hollande* (3 vols. Lond. 1821); *Histoire du Parlement Anglais* (1820); and a critique on M. de Norvins's *History of Napoleon*. Louis Bonaparte was married in 1802 to Hortense Beauharnais, daughter of General Beauharnais (q.v.) by his wife Josephine, afterwards empress of the French.

The amiable and accomplished HORTENSE EUGENIE BEAUHARNAIS, the adopted daughter of Napoleon, queen of Holland and Countess St Len, was born at Paris in 1783. After the execution of her father, she lived for some time in humble circumstances, until Napoleon's marriage with Josephine. In obedience to the plans of her step-father she rejected her intended husband, General Desaix, and married Louis Bonaparte in 1802. She lived mostly apart from her husband, even as queen of Holland; and on the downfall of the Napoleons, passed her time in various countries. She at last settled at Arenenberg, a mansion in the canton Thurgau, Switzerland, where she lived in retirement, sometimes spending a winter in Italy. In 1831, when her two sons had implicated themselves in the Italian insurrection, the countess travelled in search of them through many dangers, and found the elder deceased, and the younger, the late emperor of the French, ill at a place near Ancona. She died at Arenen-

berg in 1837, and was buried near the remains of her mother, Josephine, at Ruel, near Paris. She was the authoress of *La Reine Hortense en Italie, en France, et en Angleterre, pendant l'année 1831*, and wrote several excellent songs. She likewise composed some deservedly popular airs; among others the well-known *Partant pour la Syrie*, which the late emperor of the French, with a delicate union of political tact and filial pride, made the national air of France. Of her three sons, the eldest, NAPOLEON LOUIS CHARLES, born 1803, died in childhood in 1807.—The second, LOUIS NAPOLEON, born 1804, crown prince of Holland, married his cousin Charlotte, daughter of Joseph Bonaparte, and died in 1831.—The third, CHARLES LOUIS NAPOLEON, became emperor of the French. See NAPOLEON III.

JEROME BONAPARTE, youngest brother of Napoleon, was born at Ajaccio in 1784. After receiving his education in the college at Juilly, he served as naval lieutenant in the expedition to Hayti. When war broke out between France and England in 1803, Jerome was cruising off the West Indies, and was compelled to take refuge in the port of New York. While in America he married Elizabeth Patterson (1785–1879), daughter of a merchant in Baltimore. He fought in the war against Prussia, and in 1807 was made king of Westphalia. His administration of his kingdom was careless, extravagant, and burdensome to his subjects. The battle of Leipzig brought the reign of Jerome to a close. He fought by the side of the emperor at Waterloo. After his brother's abdication he left Paris and visited Switzerland and Austria, but ultimately settled in Florence. At the outbreak of the February revolution (1848), Jerome Bonaparte was in Paris, where he was appointed governor of the Invalides, and in 1850 was made a French marshal. He died in 1860.

His marriage with Elizabeth Patterson having been declared null by Napoleon, Jerome was forced, after he had gained the Westphalian crown, to marry Catharine, daughter of King Frederick I. of Würtemberg. After the battle of Waterloo, her father wished to annul the marriage; but she declared her resolution to share through life the fortunes of her husband. Jerome Bonaparte left in America one son, Jerome Napoleon (1805–70), by his first marriage, who was a wealthy resident, though he never became a naturalised citizen. By his second wife he had three children.—The elder son, JEROME BONAPARTE, born 1814, died in 1847.—MATHILDE BONAPARTE, Princess of Montfort, born at Trieste, 1820, married the Russian Count Anatol Demidov, and lived at the court of Louis Napoleon during his presidency.—The younger son, NAPOLEON JOSEPH CHARLES PAUL BONAPARTE, born at Trieste in 1822, passed his youth in Italy; entered the military service of Würtemberg in 1837; afterwards travelled in several countries of Europe; and was banished from France (1845) on account of his intercourse with the Republican party. After February 1848 he was elected into the Legislative National Assembly. He commanded an infantry division at the battles of Alma and Inkermann. In 1859 he married the Princess Clotilde, daughter of Victor Emmanuel, by whom he had two sons and a daughter. After the fall of the empire he took up his residence in England, but returned to France in 1872. On the death of the Prince Imperial, son of the Emperor Louis Napoleon, in Zululand in 1879, the eldest son of Prince Napoleon became the heir of the Bonapartist hopes. When, in 1886, the chiefs of the Bourbon family were expelled from France, Prince Napoleon and his eldest son were exiled also as pretenders to the throne. He died at Rome, 17th March 1891. See

1815: Bingham, *The Marriages of the Bonapartes* (2 vols. 1881).

THE BONAPARTE FAMILY.

Charles Bonaparte.

Bonar. REV. DR HORATIUS, Free Church minister and popular hymn-writer, was born in Edinburgh, 19th December 1808, and educated at the High School and university there. He was ordained to the ministry at Kelso in 1837, where he remained for nearly thirty years, when he was translated to Chalmers Memorial Free Church, Edinburgh. For a time editor of the *Christian Treasury*, *Presbyterian Review*, and *Quarterly Journal of Prophecy*, he has published besides more than twenty volumes of a religious character; but is best known as the author of *Hymns of Faith and Hope* (3 series, 1857-66), selections from which have found their way into all collections for church use. He died 31st July 1889.

Bonasia, a genus or sub-genus of gallinaceous birds of the Grouse family, comprising the Hazel Grouse of Northern Europe and the Ruffed Grouse of North America. See GROUSE.

Bonasmus, or BONASSUS. See BISON.

Bonati, GUIDO, was the great Italian astrologer of his time, and died in 1596. His works were published at Augsburg in 1491. See his *Life* by Boncompagni (Rome, 1857).

Bonaventura, ST, one of the most eminent Catholic theologians, whose real name was John of Fidenza, was born in 1221 at Bagnarea, in Tuscany. In 1243 he became a Franciscan monk; in 1253 a theological teacher at Paris, where he had studied; and in 1256 general of his order, which he governed strictly, but affectionately. His influence reconciled the differences which had sprung up among the cardinals on the death of Clement IV. in 1268, and procured the election of Gregory X. The new pope created him Bishop of Albano and cardinal in 1273, and insisted on his presence at the Council of Lyons, where he died, July 15, 1274, from sheer ascetic exhaustion. He was honoured with a splendid funeral, which was attended by the pope, the king, and all the cardinals.

On account of his unspotted character from earliest youth, as well as the miracles ascribed to him, he enjoyed, even during his lifetime, especial veneration. Dante, who wrote shortly after, places him among the saints of his *Paradiso*; in 1482 he was formally canonised by Sixtus IV.; and in 1587 was ranked by Sixtus V. as the sixth of the great doctors of the church. The religious fervour of his style procured for him the title of *Doctor Seraphicus*, and his own order are as proud of him as the Dominicans are of Thomas Aquinas. A great part of his writings is devoted to the praise of his order, and to the defence of Mariolatry, celibacy, transubstantiation, communion in one kind, and other doctrines and practices of the middle ages, which he attempts to deal with in a philosophical manner. His most important works are the *Breviloquium*, a text-book on dogmatics;

the *Itinerarium Mentis in Deum*, and *De Reductione Actuum ad Theologium*, in which he represents union with God as the highest good; and a commentary on the *Sententie* of Peter the Lombard, in which he acutely argues against the eternity of the world, and also advances some original proofs of the immortality of the soul. He did more than any other of the early theologians to give a scientific form to the mystical theology. His *Biblia Pauperum*, or 'Poor Man's Bible,' is a mystico-allegoric explanation of the plain contents of the sacred books for the benefit of the laity. In warmth of religious feeling, however, and in the practical tendency of his ethics, he far excels the hair-splitting scholastics. The most complete edition of his works appeared at Rome (8 vols. 1588-96). See the works upon Bonaventura by Hollenberg (Berlin, 1862), Richard (Paris, 1873), Borgognoni (Rome, 1874), Vicenza (German translation, 1874), and Prosper, Amiens (1886).

Bona Vista, a bay, cape, and town on the east coast of Newfoundland. The town is a port of entry, and one of the oldest settlements in the island. Pop. 2500.

Bonchamp, CHARLES, MARQUIS DE, one of the bravest of the Vendean leaders, was born at the château of Jouveteil, in Anjou, May 10, 1760. He served as a volunteer in the American revolutionary war, and was a captain in the French army at the outbreak of the French revolution. A strong royalist, he naturally disliked the revolution, and consequently lived in retirement until chosen leader of the Anjou insurgents. In conjunction with La Rochejaquelein and Cathelineau he fought with great bravery and frequent success, but his superior knowledge of military tactics was not sufficiently made use of by the insurgent army. In the sanguinary encounter at Cholet, October 17, 1793, Bonchamp received a fatal shot in the breast, and when his followers vowed to revenge his death on five thousand republican prisoners, the dying hero exclaimed: 'Spare your prisoners. I command it.' This last command was obeyed.

Bond, in Law, is an instrument on stamped paper, by which the party granting it becomes bound to pay a sum of money, or perform any act or duty, according to the terms of agreement.

In England and the United States, a bond is said to be an instrument under seal, whereby one person becomes bound to another for the payment of a sum of money, or for the performance of any other act or thing. The person who is thus bound is called the obligor, and he to whom the bond is given, the obligee; and this obligation may be either by or to one or several persons. The bond may be unconditional simply for the payment of money, or it may be accompanied with a condition, the performance of which is secured by a penalty; but in any event, the debt

created by a bond is a *Specialty Debt*, which, however, has now no preference over simple debts, the only distinction being that a specialty debt takes twenty instead of six years to prescribe. In the United States, where the law is based on that of England, the period of prescription varies from six years for simple contracts, to ten, fifteen, or twenty years for bonds in some of the states.

The requisites of a good bond are as follows: (1) The bond must have an obligor and obligee. In regard to such parties, it is to be observed that in general no person who is under any legal disability to contract can become an obligor, though it is otherwise with an obligee. An infant cannot bind himself unless the bond be for necessities; but a bond may be given to an infant, a lunatic, or an alien. (2) The next requisite of a bond is, that it must state the precise sum in which the obligor is bound; any omission in this respect will invalidate the instrument. If, however, the sum be merely erroneously stated, the courts will make the necessary correction, and construe the bond so as to give effect to the intention of the parties. The penalty stipulated on failure to pay is always now reduced to the debt and expenses. (3) A bond must be so expressed as to create a clear legal obligation. But for this purpose no particular form of words is necessary; any mode of expression by which the intention appears will suffice. A bond, again, may be in the first or third person, only in order to obtain legal facilities it must be expressed in the English language, and not in Latin or French. (4) The bond must be duly executed. Such execution, in general, is the same as that of deeds, the sealing being the essential solemnity; and although it is usual for the obligor to sign the bond, his signature is not necessary to its validity. Then the bond must be delivered, but it need not be dated; a bond has even been held good, though it bear a false or impossible date, on the principle that deeds take effect from, and have relation to, the time of their delivery, and not in reference to their date. Such, in general, is the form and structure of an English or United States bond, and it is used in an infinite variety of contracts. A bond absolute for the payment of money differs from a promissory note only by being under seal.

In Scotland, the bond—personal bond, as it is called—differs in several points of form from the English instrument. Its general structure is different, and it is executed in a different manner, with much solemnity and particularity, but without sealing; it does not bear to be for double the sum due, or any sum other than the correct one, which it states with precision, with a penalty, which is usually one-fifth of the principal sum; and it must have a *true* date, and be very specific in all its details. As in English practice, there are in Scotland two kinds of these instruments: first, bonds for money simply; and secondly, bonds for the performance and accomplishment of some act, or, as they are called in the Scots practice, bonds *ad factu præstanda*. The Scottish bond takes forty years to prescribe. It is always registered in order that summary diligence may pass upon it. Bonds taken payable to heirs, including executors, do not belong to the movable estate of the creditor.

A mortgage over land or other real estate is also in Scotland in the form of a bond, by which name, indeed, the mortgage is technically described. Thus, there is the *heritable bond*, and the *bond and disposition in security*, the latter being the more modern form. By these mortgage bonds, the borrower not only becomes personally bound in the repayment of the loan, but 'in further security and more sure payment' he also conveys to the lender the land, or other real property, itself, on which the sum is to be made a charge, with, in a certain event

and under certain conditions, a power of sale, by means of which the creditor, on the debtor's default, may recover his money. The transmission and execution of these securities are regulated chiefly by the Titles to Land (Scotland) Act, 1868. There are, in England, bonds by which expectant heirs may operate on their reversions, and these are called *Post-obit bonds* (q.v.). The English law as to sales of reversionary interests was declared by statute in 1868. See REVERSIONARY INTEREST. The name bond is also applied to many securities or general charges on which limited companies are in the habit of raising money, whether strictly in the form of an ordinary bond or not; thus also Peruvian bonds or Egyptian bonds are spoken of. The legislature of the United States authorises municipal corporations to issue bonds in aid of works of internal improvement. See DEBENTURE, LLOYD'S BONDS.

According to the law of both countries and the United States, certain bonds are void; such as a bond conditioned either to do something which the law considers wrong in itself, or which is legally prohibited, or to omit doing something which is a duty, or to encourage the performance of anything which is in the nature of a crime or offence against the law. In like manner, bonds to procure marriage, called marriage brokerage bonds, or to restrain marriage, or for immoral considerations, or in restraint of trade, are void. A bond, however, may be valid in part, or void in part, if such parts are separable. Joint and several bonds are the bonds of two or more obligors who bind themselves severally and jointly: if one pays the entire debt he is entitled to contribution from the other obligors. In some states of the American Union a married woman's bond is good. See BROUAGE BONDS, MORTGAGE, SPECIALTY DEBT.

BLANK BONDS were Scots securities, in which the creditor's name was left blank, and which passed by mere delivery, the bearer or holder being at liberty to insert his name in the blank space, and sue for payment. The intention originally was to facilitate the transmission of the obligation; but experience having proved that they were used for fraudulent purposes, these bonds were, by a Scottish act passed in 1696, declared void. The act, however, excepts from its provisions the notes of trading companies, and indorsements of bills of exchange. It is a difficult question how far certain debentures of modern joint-stock companies are negotiable, and if so, whether they are objectionable under this statute.

BOND OF CORROBORATION is an additional obligation by the debtor in a bond to accumulate arrears of interest, or granted to the heir of the creditor to save the expense of title. It used to be granted by the heir of the debtor, but since 1874 this has been rendered unnecessary by statute.

BOND OF CAUTION is the obligation given by guarantors for the faithful discharge of duty by judicial factors and such officers; and also for the damages and expenses which may be incurred by interdicts or suits of diligence (see CAUTION).

BOND CREDITOR, in England, is the name sometimes given to a creditor whose debt is secured by a bond.

Bond, Sir EDWARD AUGUSTUS, born at Hanwell, 31st December 1815, entered the British Museum in 1838, became keeper of the MSS., and in 1878 principal librarian. He has published catalogues of MSS. and fac-similes of Anglo-Saxon charters in the museum; and among other works, he has edited the *Statutes of Oxford University* (1853), Fletcher's *Russe Commonwealth* and Horsey's *Travels in Russia in the 16th Century* (1856) for the Hakluyt Society, *Speeches in the Trial of Warren Hastings* (4 vols. 1859-61), and *Chronica*

Monasterii de Melsa or *Meaux* (Rolls Ser. 3 vols. 1866-68). He has also helped to edit the *Fac-similes* published by the Palæographic Society, of which he is a founder and president. He was made LL.D. of Cambridge in 1879, a C.B. in 1885, and K.C.B. just before his death, 2d January 1898.

Bond, WILLIAM CRANCH, an American astronomer, born 19th September 1789, at Portland, Maine, became a watchmaker, and erected one of the first private observatories in the United States. In 1838 he accompanied the exploring expedition sent by government to the South Sea, and in 1840 he became director of the observatory at Harvard University. Here he and his son, George Phillips Bond (1826-65), discovered a satellite of Neptune and the eighth satellite of Saturn. He died 29th January 1859.

Bondager, the term applied in the south of Scotland and in Northumberland to a female labourer whom a 'hind' or married farm-worker undertakes to supply for the regular field-work on a farm as a condition of his tenancy of his cottage. She is frequently a member of his own family, or she may be merely engaged and boarded by him. The origin of the bondager system is the want of a sufficient rural population for the field-work of the neighbourhood.

Bonded Warehouses. The warehousing system is a plan for lessening the pressure of excise or customs duties by postponing payment of them until the goods on which they are levied pass to the consumer, or, at all events, to the retail dealer. A merchant who might import £1000 worth of wine or tobacco if he only paid duty on it by instalments as it went out to the dealer, would be quite unable to import so much if he had to pay heavy duty immediately upon the arrival of his goods. Hence the adoption of the bonded warehouse or warehousing system, which also affords to merchants facilities for free exportation. The taxable commodity is locked up in a 'bonded' warehouse, which has been approved by the Commissioners of Customs or of Inland Revenue. It is under the supervision of the revenue officers from the time it is entered into until it is finally cleared out of the warehouse, and the revenue is further protected by bond given for due exportation or for payment of duty. This bond was formerly entered into by the importer, but the security is now given by the warehouse-keeper. 'Bonding' was part of the scheme of Sir Robert Walpole in 1733, generally known as the 'Excise Scheme,' which was defeated, however, on account of its unpopularity. The system was first authorised for the customs by an Act of George III. in 1802. The excise system of warehousing dates from 1823. In successive years various acts and departmental regulations have been issued, extending or defining the privileges, and in 1882 the excise and customs systems were assimilated, the new code adopting excise methods to a considerable extent. While in the warehouse 'wet' goods—i.e. wines and spirits—may be operated upon by racking, blending, mixing, sweetening, and colouring, under strictly defined conditions. Wines may be refined and fortified. No compensation can be made by the Customs or Inland Revenue authorities to any importer or proprietor of goods by reason of any damage occasioned in the warehouse by fire or any other accident. The warehousing system has also, by retaining the goods for the owner, whoever he may be, created a complete system of paper-money in the transference of the title-deeds, as they may be called, of such goods—the dock-warrants or other documents—the possession of which is equivalent to possession of the goods.

Bondi, CLEMENTE, an Italian poet, was born 27th June 1742 at Mezzano, in Parma. He was educated by the Jesuits, and when still very young, was appointed to deliver lectures on rhetoric in the Royal Convent at Parma. Here he produced his first work, *Giornata Villereccia* (1773), a comic picture of the rural pleasures of the brotherhood. For having celebrated in verse the abolition of the Jesuit order, he was compelled to fly to the Tyrol; and after his return he lived at Venice, at Mantua, and at Milan, where he found a patron in the Austrian Archduke Ferdinand, who appointed him his librarian at Brinn. Later he lived at Vienna, where he died on 20th June 1821. His poems are lyrical, descriptive, satirical, and elegiac, written in pure style and graceful verse.

Bundu, a country of Senegambia, West Africa, to the W. of Bambouk, lying between 14°—15° N. lat. and 12°—13° W. long. The surface of Bondu is mostly level, the climate healthy, and vegetation luxuriant alike in field and forest. The inhabitants, who are chiefly Fulahs, profess Mohammedanism, but they trust greatly in sorcerers. The sovereign is absolute. When Park, the first European to visit Bondu, was in the country, the royal residence was at Fatteconda; since, it has been removed to Bulibani, a place of 3000 inhabitants, on the principal river, the Falemé. The country is now a French dependency. Pop. 30,000—50,000.

Bone is the hard material of the skeleton of mammalian animals, reptiles, birds, and certain fishes. When the different bones of the skeleton are connected together, they form a framework which affords support to soft parts, and protects delicate organs from injury, while at the same time preserving the shape of the body. Further, the bones, being movably joined to each other, and being acted upon by the attached muscles, become a series of levers capable of executing various movements, and thus, in the case of the bones of the lower extremity, they are the passive instruments of locomotion. In colour, bone is white, but in the living body it has in addition a pink and slightly bluish tint. Besides being *hard*, it possesses a certain amount of *toughness* and *elasticity*, properties which are well marked in the ribs and clavicle. Arab children are said to make good bows of the ribs of camels, and the elasticity of the merrythought—i.e. united clavicles—of birds is familiar to all. Its strength is remarkable as contrasted with other substances:

Fine Freestone.....	1·0
Lead.....	6·5
Elm and Ash.....	8·5
Box, Yew, Oak.....	11·0
Bone.....	22·0

We thus see that bone is twice as strong as oak, and a cubic inch of bone will support a weight of 5000 lb.

Chemical Composition of Bone.—It consists of an animal and an earthy part intimately combined together. The following table shows a percentage analysis of adult human bones by Berzelius:

Animal Matter.....	33·30
Phosphate of Lime.....	51·04
Carbonate of Lime.....	11·30
Fluoride of Calcium.....	2·00
Earthy Salts.....	1·16
Phosphate of Magnesium.....	1·16
Soda and Chloride of Sodium (Common Salt).....	1·20
	100·00

If we expose a bone to intense heat, the animal matter is got rid of, and though the bone retains its original form, yet the slightest touch will cause its now unsupported earthy matter to crumble away. On the other hand, by soaking a bone in diluted hydrochloric acid, the earthy matters are

gradually dissolved out, leaving a tough, somewhat transparent, flexible, and even elastic substance, which also retains the original figure of the bone in its most minute details. This residue is softer and more flexible than cartilage, and when boiled in water it is almost wholly resolved into *gelatin*, which *sets* or *gelatinises* on cooling. We see in the ill-nourished children of large towns too many examples of how necessary is the proper relation of these two elements of bone to each other. In the disease called rickets, the earthy matter is deficient, and the too flexible leg-bones bend under the weight of the trunk; in the aged person, again, the osseous substance being more densely packed with earthy matter becomes brittle, rendering them peculiarly liable to fractures.

Bones are classified according to their shapes—viz.: (1) *long*—e.g. thigh-bone and arm-bone; (2) *flat* or *plate-like*—e.g. shoulder-blade and bones of skull-cap; (3) *short* and *irregular* or *cubical*—e.g. those of the wrist or the vertebrae.

On making a section of a bone, it will be seen that the osseous substance is arranged differently in different parts, being either dense and close, and called *compact*, or open and reticulated, and called *spongy* or *cancellated*. There is, however, no abrupt limit between the two kinds, for they pass insensibly into each other. Again, in all bones the part next the surface is compact, and forms a shell or crust which contains the spongy texture within. Long bones have a shaft of compact substance with very little spongy tissue within, but at each end the spongy tissue predominates, having only a thin coating of compact substance, and thus the expanded rounded extremities enter into the formation of joints. Flat bones consist of two layers of hard tissue with intermediate spongy texture usually called *diploë*. Irregular bones are spongy throughout, with only a thin crust of compact substance. Close examination of cancellous tissue reveals the fact that it consists of numerous slender bars or lamellæ, which unite together to form an open lattice-work (*cancelli*), from which it takes its name. Considerable strength is thus obtained without undue weight; and it will be seen that the strongest lamellæ run in those directions which are naturally exposed to the greatest pressure. The following experiment will show that spongy tissue is able to sustain great weight in spite of its apparently fragile nature: A cubic inch of cancellous texture was taken from the lower end of the thigh-bone and placed with its principal layers upright. Four hundred-weight was then placed upon it, but it did not give way in the least; six hundred-weight made it sink half an inch; yet the cubic inch of bone itself did not weigh more than fifty-four grains.

Compact bone is also full of holes which are very small and require a magnifying glass to examine them. If a transverse section be examined under the microscope, these round openings are seen to be the mouths of longitudinal canals named after Clopton Havers, an English physician and writer of the 17th century, who first specially directed attention to them—*Haversian Canals*. Blood-vessels run in them, and the widest also contain marrow. They vary in diameter from $\frac{1}{2000}$ th to $\frac{1}{200}$ th of an inch. They are short, and unite freely with each other. Those nearer the circumference open on the surface by minute pores; those placed deeply communicate freely with the spaces in the spongy tissue, so that they form an extensive network of tubes in which blood-vessels are lodged.

Each canal is surrounded by a series of concentric rings, each of which is a layer of condensed structure. Between these rings minute cavities are found, called *lacunæ*, generally oval in man. These communicate with each other and with the

Haversian canal in the centre by means of fine pores or tubes called *canaliculi*, and thus it is evident that nutrient material can pass from the

Transverse Section of Compact Tissue of Humerus, magnified about 110 diameters. (From Quain.)

Haversian canal through the rings of dense bone which surround it, and which with the lacunæ and canaliculi are grouped together under the name of a Haversian system.

Bone is covered externally by a fibrous membrane which adheres very closely, investing every part of the surface except where there is cartilage, and called the *periosteum*. In this membrane fine vessels and nerves ramify, ultimately sending their minute branches into the Haversian canals. If the periosteum should be stripped off, there is great risk that the denuded portion of bone will be deprived of its nourishment and die.

The interior of the shaft of long bones is hollow, and thus we get a further combination of strength and lightness. In some animals this hollow space is filled with air, but in mammals there are no air-spaces in any bones except those of the head. The hollow shaft is therefore filled with *marrow* (medulla), which occupies the spaces of the spongy bone, and even extends into the widest Haversian canals. Lining the medullary canal there is a fine membrane named the *internal periosteum*. Its vessels partly supply the bone and partly the marrow. In long bones the marrow is like ordinary Adipose Tissue (q.v.), but in short bones and in cancellated tissues generally the marrow is more fluid, contains fewer fat-cells, and is red in colour.

In addition to the blood supplied to the bone through the vessels in the periosteum, one of considerable size, called the *medullary artery*, enters the canal containing the marrow by a hole running obliquely through the dense bone. Complete anastomosis takes place between the arteries on the surface and those in the interior of the bone. As has been stated, nerves enter the bone, but how they terminate is uncertain; and experiments seem to show that healthy bone is almost devoid of sensibility, while, on the other hand, the pain of an inflamed bone is extreme. In its earliest stages, bone may be said to exist as a mass of cells having the outward form but none of the characters of bone. Soon, however, these cells become cartilaginous, and in due time points or *centres of ossification* appear; the cells alter their form and arrangement, and by a deposit of earthy materials the bony tissue gradually becomes formed, rendering the previously flexible substance rigid. However, bone does not form in cartilage in every instance, for the bones of the face and skull-cap arise in connective tissue. Hence we have two great modes of ossification—viz. *intra-cartilaginous* and *intra-membranous*.

The uses to which a bone may be put are various. In the cooking of soups, bones form a constant ingredient, and become useful in supplying gelatin, which gives a *body* to the soup it would not otherwise possess. Even when buried, the organic matter is long retained—e.g. Gimbernat made soup from the gelatin of a mastodon's tooth, and Dr Buckland did the same from the fossil bones of the hyena. Where the soup is required of great lightness, for an invalid with weak digestive powers, the shavings of stags' horns may be employed, and these yield a *hartshorn jelly* free from oil, and which therefore sits lightly upon the stomach. How far gelatin is of itself nutritious is a disputed question (see GELATIN, FOOD, and NUTRITION). Animals, however, like the dog, which masticate, devour, and digest the entire bone, do derive benefit therefrom, in part from the gelatin, and in part from the earthly substances; and the same remark applies to the use sometimes made of small fish, where, after being thoroughly browned, they are entirely eaten. In times of scarcity in Norway and Sweden, the poorer people even eat the bones of mackerel and other fish.

Bone is largely used in making the handles of small brushes, table-knives and forks, and pen-knives, and in the manufacture of Combs (q.v.). Our forefathers, before the metals were known, fashioned fish-hooks out of bone, and used the spines in the tail and back-fin of certain fishes for pointing arrows. These uses of bone, coupled with the employment of the serrated teeth of sharks as a war-weapon, are still practised by many uncivilised tribes. The fatty and other organic matters in bone allow of its being employed as a fuel where coal or wood cannot be obtained, as in the pampas of South America and the steppes of Tartary. In these regions it is considered that the heat evolved during the combustion of the bones of an ox suffices to cook the flesh.

Bone is likewise serviceable in the arts in yielding bone-ash, bone-black, bone-dust, dissolved bones, phosphorus, and superphosphates, also certain oils and fats, which are employed in forming Lampblack (q.v.), and in the manufacture of soap. Bone may suffer from atrophy, hypertrophy, or degeneration (see RICKETS), often from constitutional affections due to Scrofula or Syphilis (q.v.); Caries and Necrosis (q.v.) are specific bone diseases; inflammation of the bone causes Ostitis; of the periosteum, Periostitis (q.v.); of the medulla, Osteo-myelitis. For ossification of arteries, see ARTERIES, TUMOUR; and for broken bones, FRACTURE. Various matters connected with the bones will be found at ANATOMY, ARM, BIRDS, COLLAR-BONE, FOOD, HAND, JOINTS, OSSIFICATION, RIBS, SKELETON, SPINAL COLUMN, &c.

Bone, a city. See BONA.

Bone, HENRY, enamel-painter, was born at Truro, Cornwall, 6th February 1755. Apprenticed to a Plymouth china-manufacturer, he removed with his master the year after to Bristol, and here he worked for six years at the famous Bristol china-works until their failure drove him to London to push his fortune. He soon found employment in enamelling watches and fans, and afterwards in making enamel portraits, brooches, &c. A portrait of his wife, exhibited at the Royal Academy in 1780, first attracted public attention; and he soon obtained a position which rendered it no longer necessary for him to continue his drudgery for the jewellers. In 1801 he was appointed enamel-painter to George III., and elected associate of the Royal Academy. Elected R.A. in 1811, he exhibited in that year his large enamel, 'Bacchus and Ariadne,' after Titian, which was sold for 2200 guineas, and is now in the National Gallery. From

this time, until his eyesight failed in 1831, he produced a series of large and beautiful works, among them the well-known 'Death of Dido,' and 'Hope Nursing Love,' after Sir J. Reynolds. He also executed a large number of historical portraits of the time of Elizabeth, besides a series of portraits of the Russell family. He died December 17, 1834. His works are now eagerly sought after by collectors, and are esteemed among the very best examples of his particular art.

Bone-ash, or BONE-EARTH, is obtained by the complete combustion of bones in an open furnace, when the oxygen of the air burns away the organic matter or gelatin, and leaves the earthly constituents as a white friable mass, the size of the original bone, but readily reducible to the condition of coarse powder which is bone-ash. A very large quantity of bone-ash is exported from South America to other countries, especially Britain. The used-up bone-black of the sugar-refiner is also employed as a source of bone-ash, by being heated in a furnace exposed to the air. Bone-ash of good quality contains about 80 per cent. of phosphate of lime, and 20 per cent. of carbonate of lime, phosphate of magnesia, soda, and chloride of sodium (common salt); but it is occasionally found mixed with sand, especially that procured from South America. Bone-ash is employed to some extent as a source of Phosphorus (q.v.), and in the making of Cupels (q.v.) for the process of Assaying (q.v.); but the most extensive use is in the manufacture of artificial manures, such as Dissolved Bones (q.v.) and superphosphates.

Bone-beds, the name given by geologists to thin beds or layers which are largely made up of the debris of bones of reptiles, fish, &c. Examples are the Ludlow bone-bed of the Silurian, the Bettes bone-bed of the Bradford coal-measures, the Rhaetic bone-bed, and the Tilgate stone of the Wealden series. In the bone-beds of more recent geological age mammalian remains abound, as in the Suffolk bone-bed of the Coralline eras.

Bone-black, the product of the carbonisation of bones, used as a pigment (see BLACK) and as a deodoriser. See CHARCOAL.

Bone Caves. See CAVES.

Bone Manures are applied to crops on account of the nitrogen—equivalent to 4 or 5 per cent. of ammonia—and the phosphate of lime which they contain—the latter amounting to nearly half their weight. Their value has only recently been discovered. The first crude bone-crushing machines were used in England in 1814. In Scotland, when bones began to be employed as manure, about 1825, they were roughly broken into large splinters with hammers by the farm-servants during wet weather, and 30 bushels applied per acre, at a cost of half-a-crown a bushel. Five hundredweight per acre is now considered a good dressing. Bones are not applied in good practice in a larger size than that of *meal* or *floor*—in other words, ground into a fine state of division.—*Rough Bones*, as quarter-inch size and larger, are rarely used, as these lock up capital in the soil by taking too much time to decay, and do not give a remunerative return in comparison with manures that act quickly. Bones are sometimes fermented to induce decay. They are piled in heaps, and water or urine poured over them. When the heat resulting from the fermentation goes down, they should be turned and watered again, and this kept up for a few months. Bones in an altered form are also used in making up concentrated manure, and are either ground or acted upon by sulphuric acid—for example:

(1) *Steamed Bone*, or degelatinised bone, results when bone is made friable and more easy of assimilation by plants through the action of superheated

steam (at 270°–280° F.) removing the fatty and gelatinous matter; but there is a loss of nitrogen in the process, as there is also in the preparation of ash and char.

(2) *Bone-ash* is the residue from bones burnt as fuel used in the 'rendering' of the fat of cattle in South America.

(3) *Bone-char* is made by heating in a close retort, and used largely for refining sugar before it goes for manure.

(4) *Vitriolised Bone* is a material only partially acted upon by acid—the result of a most wasteful practice deserving of condemnation, as destroying microbes which bring about nitrification in the soil.

(5) *Dissolved Bone* is bone broken into half-inch size, and then acted upon by sulphuric acid, so as to change a portion (about half) of the insoluble tribasic phosphate of lime into the soluble monobasic phosphate and the sulphate of lime; thus, $\text{Ca}_3\text{P}_2\text{O}_8 + 2\text{H}_2\text{SO}_4 = \text{CaO} \cdot 2\text{H}_2\text{O} \cdot \text{P}_2\text{O}_5 + 2\text{CaSO}_4$. Sulphuric acid is peculiarly suitable for this purpose as compared with say hydrochloric acid, as by the formation of sulphate of lime—or in common language, plaster of Paris—a part of the moisture is absorbed, and the resulting material is left in a dry condition, which is essential for its proper distribution on the land. The object—extraordinary minuteness of division—is obtained, although the soluble condition disappears soon after its application to the soil. The dissolving of bones is now held to be wasteful because soluble phosphate of lime is procurable from many other cheaper sources. It is also unsatisfactory on account of the acid destroying the microbes of nitrification, so useful to the soil, which exist in large quantities in bones and all sorts of decaying animal matter. Liebig was the originator of the method in 1839, and during the next few years it was taken up by leading farmers in England and carried out as a farm operation. Now the work has fallen into the hands of manufacturers who can make it cheaper and, if they choose, better. Much adulteration has been practised in this trade at the expense of farmers. This was made possible owing to their ignorance and prejudices against learning anything scientific. Much manure sold as 'dissolved bone' is merely a mixture of soluble phosphate and some such nitrogenous material as nitrate of soda and sulphate of ammonia—the valuable substances being in the proportions present in bone. Soluble phosphate of lime, from whatever source, has a more beneficial influence on the turnip-crop than upon any other crop, because the turnip roots are not so able as the roots of other plants, such as wheat, to make use of the natural supply of phosphates existing in the soil in the insoluble form, even when this is abundant. Should the stock of phosphoric acid in the soil be reduced too far, the crop produce is reduced accordingly; it is necessary, therefore, to apply at least sufficient of this ingredient to make up for the loss resulting from the removal of the sale produce of a farm. The famous example of the deterioration of the Cheshire pastures on the rich soils of the new red sandstone by the yearly drain of phosphates through the sale of dairy produce, is now a matter of history. It is recorded that by the application of bones to these soils the value was doubled. Bone meal or flour is the most valuable form for application to thin, light, or hungry soils, as it decays in time to feed the growing crop, and is not liable to be washed out. In heavy land, ground bones are of little or no value—they get imbedded in the clay, and are preserved so that they cannot yield their substance to act as manure. On such soils the phosphate of lime should be used in the soluble form. Many thousands of tons of bones are annually imported from South America, whence we draw our largest

supply. India contributes the next largest amount, the Hindus being prejudiced against the use of bone as manure.

Boner, ULRICH, one of the oldest German fabulists, was a preaching friar of Bern, and is frequently mentioned in documents of the years 1324–49. His collection of a hundred fables was entitled *Der Edelstein*, and was first printed, with woodcuts, at Bamberg in 1461. Only two copies now exist. Breiting published a complete edition of the work at Zurich in 1757, under the title, *Fabeln aus den Zeiten der Minnesinger*, which supplied materials to Lessing for his studies on the philosophy of fable. A more complete edition was published in 1844 by Franz Pfeiffer as vol. iv. of *Dichtungen des Deutschen Mittelalters*.

Boneset, a kind of Eupatorium (q.v.).

Bonesetters are a class of men who often possess a considerable local reputation for success in the treatment of injuries to the limbs, especially in cases where stiffness and pain have persisted long after an accident. They are usually uneducated men; and the knowledge they possess has been handed down by oral tradition, often for many generations and in the same family. Their chief method in the cases alluded to consists in effecting a sudden forcible movement of the affected part. As they are ignorant of anatomy, and of the signs of disease, they sometimes do immense harm by applying the method to unsuitable cases. But without doubt they have sometimes effected a cure where regular practitioners have failed. A detailed account of their methods, &c. was given to the medical profession by Dr Wharton Hood in a book *On Bonesetting* (1871). See DISLOCATION, FRACTURE.

Boness, or BORROWSTOUNNESS, a seaport in Linlithgowshire, on the Firth of Forth, 23 miles WNW. of Edinburgh. A dingy place, it has a fine parish church (1886), a wet-dock of $7\frac{1}{2}$ acres (1881), a large shipping trade in coal, and manufactures of salt, soap, malt, vitriol, iron, earthenware, &c. *Graham's Dyke*, otherwise Antoninus' Wall, traverses the parish. Dugald Stewart spent the last twenty years of his life at Kinneil House (Duke of Hamilton) in the neighbourhood. Pop. (1851) 2645; (1881) 5284; (1891) 5866.

Bonfire, a fire kindled in celebration of some event of public interest, usually in an open conspicuous place, as the top of a hill, or the centre of a village-green, but applied also to any great blazing fire of whatever material. Such fires were especially lighted on certain anniversaries, as the eves of St John and St Peter, and their origin in our country may be traced to pre-Christian times. The Scotch form *bauc-fire* best shows the origin of the word—a fire for burning bones, and Dr Murray notes that for the annual midsummer 'banefire' or 'bonfire' in the burgh of Hawick old bones were regularly collected and stored up down to about 1800. See BELTANE, BEACON, and vol. i. of Ellis's edition of Brand's *Popular Antiquities*.

Bongar, or ROCK-SNAKE (*Bungarus*), a genus of venomous serpents allied to the genera Elaps and Naja, and distinguished by the compressed body, which bears on the back a row of hexagonal scales larger than the rest. The head is broad and depressed; the tail is short. The species, which appear to be few—only two being certainly known—are natives of the East Indies. *B. caeruleus* (paraguda) is very poisonous, and has a dark-blue ground colour, with narrow white lines in front, and cross rows of spots behind. *B. annularis* (pamali), also very poisonous, has black rings on a yellow ground, may be over 6 feet in length, and is found in Ceylon and China as well as in India.

Bongardia, a peculiar herbaceous genus of Berberideæ (q.v.), natives of the East. One species (*B. Rauwolfiæ*) produces tubers, which are eaten, either boiled or roasted, in Persia; and the leaves of another (*B. chrysogonum*) have an acid taste, and are eaten as a salad.

Bongo, or OBONGO, are a Negroid people in the basin of the Ogowe River.

Bonheur. ROSALIE (more commonly called ROSA), a French animal painter, born at Bordeaux, 16th March 1822. Her first master was her own father, Raymond Bonheur, an artist of merit, who died in 1853. In 1841 she figured for the first time in the Salon, showing a couple of small works—'Two Rabbits' and 'Goats and Sheep'—that indicated the department in which she was to attain future eminence. These were followed by a succession of highly finished compositions; the year 1849 producing what some consider her masterpiece, 'Ploughing with Oxen,' now in the Luxembourg. In 1853 her famous 'Horse Fair' was the principal attraction of the Salon; it was acquired for over £10,000 from the Stewart collection by Mr C. Vanderbilt, who presented it to the Gallery of New York. One of the two smaller replicas—that from which the well-known engraving was made—is in the National Gallery, London. In 1865 she exhibited a large landscape, 'Hay-making in Auvergne.' Rosa Bonheur long directed a School of Design for young girls. In 1853 she became entitled to the cross of the Legion of Honour, but because of her sex the decoration was withheld till 1865. During the siege of Paris (1870–71), her studio and residence at Fontainebleau were spared and respected by special order of the then Crown Prince of Prussia. Her success in painting animals has been largely due to her conscientious study of living subjects; she has succeeded in rendering spirited action in animals; and many of her works are known in England through engravings. See Laruelle's *Rosa Bonheur, sa Vie, ses Œuvres* (1885). She died 26th May 1899.

Boni, a state on the east coast of the south-west peninsula of the island of Celebes, in the Pacific Ocean, with an estimated area of 935 sq. m. It was formerly the most powerful state in Celebes, but since 1859 has been practically a Dutch dependency. In the north the scenery is fine, and the soil fertile—rice, sugo, and cassia being produced. The inhabitants, called Bugis, have an allied language to the Macassars, with a literature of their own. Their towns and villages dot the coast, and as enterprising merchants and sailors the Bugis are found in every port of the East Indian Archipelago; they also engage in agriculture and in the manufacture of cotton and articles of gold and iron, in which they have a large trade. They are well built, active, and brave, and are lighter skinned, as well as superior in honesty and morality to other Malay races. Their institutions, said to be very ancient, partake of the character of a constitutional monarchy. The British have twice attacked the Bonese for injuring their commerce, and selling the crews of British ships into slavery. In the second attack, in 1814, the Bonese king was killed. The number of the population is unknown; some estimates give as much as 200,000. The capital, called Boni, stands on the coast of the south-west peninsula.—The GULF OF BONI separates the south-east and south-west peninsulas of Celebes. It is 200 miles long, and 40–80 miles broad.

Boniface, the name of nine popes, most of whom are of no historic note.—Boniface I. (418–22) was the first who assumed as Bishop of Rome the title of First Bishop of Christendom.—Boniface III., who was pope only for ten months in the year 607,

was the first to whom the title of Universal Bishop of Christendom was conceded by the Greek Emperor (Phocas).—Boniface VIII., previously Benedict Cajetan, a native of Anagni, was elected pope in 1294. His inauguration was distinguished by great pomp: the kings of Hungary and Sicily held the reins of his horse as he proceeded to the Lateran, and with their crowns upon their heads, served him at table. His tenure of the Roman see was marked by the most strenuous assertion of papal authority. In a bull of 1302 he claimed to possess supreme power alike in temporal and spiritual affairs. He failed, however, in his attempts to assert a feudal superiority over Sicily, and to exercise his papal authority in the disputes between France and England. He sought without success to call Edward I. of England to account for his attempted conquest of Scotland. Philip the Fair of France, supported by his states and clergy, maintained the independence of the kingdom, disregarding many bulls and briefs, and even the sentence of excommunication to which the pope proceeded. Philip at last, with the aid of Italian enemies of Boniface, made him prisoner at Anagni, to which he had fled; and though he was liberated by the people of Anagni, he died at Rome soon afterwards in 1303. For his simony Dante has given him a place in the *Inferno* (canto xxvii.). He instituted the Roman jubilee in the year 1300, granting a plenary indulgence to all who should visit the sanctuaries of Rome in that year.—Boniface IX. (Peter Tomacelli), a native of Naples, succeeded Urban VI. as pope at Rome in 1389, whilst Clement VII. was pope at Avignon. He became notorious for his shameless sale of ecclesiastical offices and benefices, and of dispensations and indulgences. He acquired, after a struggle, a most despotic power in Rome. The annates, which had previously been an occasional payment, were by him made permanent in 1392. He died in 1404.

Boniface, a generic name for an innkeeper, like 'mine host' or 'landlord,' from the name of the jovial innkeeper in Farquhar's *Beau's Stratagem* (1707).

Boniface, ST., 'the Apostle of Germany,' whose original name was Winfried, was born at Crediton, in Devonshire, about 680. He entered a Benedictine monastery in Exeter at the age of thirteen, and afterwards removed to that of Nursling, in Hampshire, where he taught rhetoric, history, and theology, and became a priest at the age of thirty. He seems to have adopted the name Boniface when he first turned monk. A movement, proceeding from England and Ireland, was then going on for the conversion of the still heathen peoples of Europe; Gallus and Emmeran had been sent in 614 to Alemannia, Kilian (murdered 689) to Bavaria, Willibrord (died 696) to the country of the Franks, and Siegfried to Sweden. Winfried also took the resolution (716) of preaching Christianity to the Frisians, among whom it had not yet found entrance. But a war broke out between Charles Martel and the king of the Frisians, and Winfried returned from Utrecht to Nursling, of which he might have become abbot. But bent upon his design, he repaired to Rome in 718, and received the authorisation of Pope Gregory II. to preach the gospel to all the tribes of Germany. He went first to Thuringia and Bavaria, then laboured three years in Friesland, and travelled through Hesse and Saxony, everywhere baptising multitudes, and consecrating their idolatrous groves as churches. In 723 Gregory II. called him to Rome; consecrated him bishop, and furnished him with letters to Charles Martel and all princes and bishops, requesting their aid in his pious work. Returning to Hesse (724), he destroyed the objects of heathen

worship (among them the great oak of Geismar, sacred to Thor, and an idol named Stuflo, on a summit of the Harz, still called Stullenberg), founded churches and convents, and called to his aid priests, monks, and nuns from England, whom he distributed through the various countries. In recognition of his eminent services, Gregory III. sent him (732) the pallium, and named him archbishop and primate of all Germany, with power to establish bishoprics wherever he saw fit. Boniface now made a third journey to Rome (738), and was appointed papal legate for Germany. The bishoprics of Ratisbon, Erfurt, Paderborn, Würzburg, Eichstätt, and Salzburg owe their establishment to St Boniface. The famous abbey of Fulda is also one of his foundations. In 746 he was chosen Archbishop of Mainz, and in 752 he is said to have consecrated Pepin as king of the Franks at Soissons. In 754 he resigned the archbishopric, and had resumed his apostolical labours among the Frisians, when at Dokkum, 18 miles north-east of Leeuwarden, in West Friesland, he was fallen upon by a band of armed heathens, and killed, along with the congregation of converts that were with him (5th June 755). His remains were taken first to Utrecht, then to Mainz, and finally to Fulda. In the abbey there is still shown a copy of the gospels written by him, with a leaf stained with his blood. A collection of his letters, and the canons he promulgated for the discipline of the newly-established churches, have been preserved, and are instructive as to the state of Germany at the time. The best editions of his Letters (*Épistole*) are those of Giles (2 vols. Lond. 1844), and Jaffé (Berlin, 1866), to which is appended the Life of him by Willibald. In 1811 a monument was erected to St Boniface on a hill near Altenberga, in the principality of Gotha, where, according to tradition, he had founded (724) the first Christian church in North Germany. A statue by Henschel was also erected to him at Fulda in 1842. See German works on Boniface by Seiters (1845), Müller (1870), Werner (1875), Fischer (1881), and Ebrard (1882); also Merivale, *Conversion of the West: the Continental Teutons* (1878).

Bonifacio, STRAIT OF, the modern name of the strait between Corsica and Sardinia, the *Fretum Gallicum* of the Romans. At the narrowest part it is only 7 miles wide, and the navigation is difficult. The strait receives its name from the small town of Bonifacio in Corsica, with an excellent harbour; pop. 3397.

Bonillo, a town of Spain, 34 miles WNW. of Albacete. Pop. 4500.

Bonin', or (Japanese) OGASAWARA ISLANDS, a volcanic group in the Pacific Ocean, 700 miles SSE. of Japan, stretching between 26° 30'—27° 45' N. lat., and between 140°—143° E. long. Area, 32 sq. m.; pop. about 200. Discovered by Quast and Tasman in 1639, they were taken possession of for Britain in 1827 by Captain Beechey; but in 1878 the Japanese reasserted their sovereignty, with the view of making them a penal settlement. The harbour is named Port Lloyd.

Bonington. RICHARD PARKES, painter in oil and water-colours, was born at Arnold, near Nottingham, on 25th October 1801. His father, who had been governor of Nottingham prison, after many vicissitudes settled at Calais, where the son was placed under Louis Francia, the water-colour painter; and he afterwards studied in Paris—in the Louvre, at the Institute, and under Baron Gros. His water-colours sold rapidly. In 1822 he began to exhibit in the Salon, and received a premium from the Société des Amis des Arts for his views of Havre and Lillebonne; and two years later he was awarded a medal at the Salon, when Constable and Copley Fielding were similarly

decorated. He now occupied himself with lithography; many of his sketches were reproduced by this method in such works as Baron Taylor's *Voyages Pittoresques dans l'ancienne France*, and he occasionally drew upon the stone himself, from his own designs and those of other artists. A fine collection of his work of this kind is preserved in the print-room of the British Museum. About 1825 he took to oil-painting, and in that year visited England, accompanied by Delacroix, in whose studio he worked after his return to Paris; and having visited Italy, he produced his splendid Venice views of the 'Ducal Palace' and the 'Grand Canal,' which figured in the Salon of 1827, along with his 'Francis I. and the Queen of Navarre' and his 'Henry III. receiving the Spanish Ambassador.' He also exhibited in the Royal Academy and the British Institution. His position was now fully established, and commissions came to him in plenty; but he caught an attack of brain-fever from exposure while sketching in the sun, and speedily fell into a decline. He visited London for medical advice, and died there, 23d September 1828. Of late years the fame of Bonington has been steadily increasing, and he is recognised as a most accomplished and original painter of landscape and architectural subjects, as well as of scenes of historical *genre*. He is especially admired for the purity and brilliancy of his colouring. His 'Henry III. receiving the Spanish Ambassador' was bought by Lord Hertford for 49,000 francs; and his 'Grand Canal, Venice,' and the 'Fishmarket, Boulogne,' realised £3150 each at the Novar sale. The Louvre contains several of his studies and an admirable example of his figure-pieces in oil, 'Francis I., Charles V., and the Duchess d'Etampes.' The National Gallery possesses the 'Piazzetta, St Marks, Venice,' 'Sunset,' and three water-colours by the artist.

Boni'to, a name common to several fishes of the mackerel family (*Scombridae*).—(1) One of these, *Thynnus pelamys*, sometimes called the

Bonito, or Stripe-bellied Tunny.

Stripe-bellied Tunny, and of the same genus with the Tunny (q.v.), is well known to sailors as an inhabitant of the tropical parts of the Atlantic and Indian Oceans, and as one of the fishes most frequently seen pursuing the flying-fish. It is often taken by an imitation flying-fish made to skim along and touch the waves. Its flesh is not regarded as very wholesome, though not unnaturally relished by those who have been previously confined to salt provisions. It is occasionally but rarely caught on the British coasts. It is a very beautiful fish, seldom exceeding 30 inches in length, of a beautiful steel-blue colour, darker on the back, and whitish below. Four dark lines extend along each side of the belly. The general form resembles that of the mackerel, but is less compressed.—(2) The Mediterranean Bonito (*Pelamys sarda*) is closely allied. It has the same blue back and dark transverse bars reaching from the dorsal ridge to the lateral line. It is plentiful in the Black Sea, and has been found in the North Sea. Its flesh is esteemed.—(3) The Plain Bonito (*Axius vulgaris* or *A. rochei*), found in the Mediterranean,

may be distinguished at once from both of these by its more uniform blue colour, without stripes or bands, and by the widely separated dorsal fins. Its flesh is little esteemed when fresh; it is generally used either salted or pickled. This fish has been occasionally caught on the coast of England, and even of Scotland.—The Sucking-fish (*Echeneis remora*), credited with retarding ships, the gorgeous John Dory (*Zeus faber*), the beautiful 'Dolphins' (*Coryphæna*), are allied genera of the same family. See MACKEREL.

Bonivard, FRANÇOIS DE, a younger son of a family which held large possessions under the House of Savoy, was born about 1496 at Seyssel, on the Rhone, and in 1513 became prior of St Victor at Geneva. Falling under the suspicion of the Duke of Savoy, he was taken prisoner by him in 1519. After twenty months' imprisonment he was set free, but in 1530 he was again seized, and taken to the castle of Chillon at the east end of the Lake of Geneva, where he was imprisoned for six years, the last four in that subterranean vault which the genius of Byron has made famous by his poem on the sufferings of *The Prisoner of Chillon*. The details of Bonivard's history were unknown to Byron; the highly wrought description of the prisoner 'chained to a column stone' sprang from the imagination of the poet, and is now embodied in the local tradition. On the capture of Chillon by the Bernese and Genevese in 1536, he was liberated, and returned to Geneva. The priory of St Victor had meanwhile been rased for the defence of the city, and the now Protestant government, having devoted its revenues to the hospital, awarded Bonivard a pension. He died in 1570, leaving the town his books, which were the nucleus of the Geneva library. Bonivard was an indefatigable writer. His chief works are his *Chroniques de Genève* (1551; new ed. 2 vols. 1831), and *De l'Ancienne et Nouvelle Police de Genève* (1555), in which he paints in the blackest possible colours the opponents of the dominant Calvinist party. The credit of Bonivard, both as an historian and as a man, has in recent years suffered much from the investigations of more trustworthy historians. See works by Chaponnière (1846), Vuillemin (1863), Gaberel (1869); and Rossel's *Hist. Litt. de la Suisse Romande* (1889).

Bonn, a town of Rhenish Prussia, beautifully situated on the left bank of the Rhine (here 600 yards wide), 21 miles SSE. of Cologne by rail. The Minster, said to have been founded by the Empress Helena in 320, but dating chiefly from the 11th and 13th centuries, has been restored since 1847. It is a good specimen of Romanesque and Transition, and has five towers, the middle one 311 feet high. Near the Minster is a monument to Beethoven, who was born in the Rheingasse; and at Bonn are buried Niebuhr, Bunsen, and Schumann. There are seven other places of worship, besides English and Old Catholic congregations; Reinkens, the first Old Catholic bishop, having made Bonn his residence. The university, founded in 1777-86, in 1802 was transformed into a lyceum, but was re-established in 1818, receiving from government the beautiful electoral palace (1717-30) and other buildings, with an annual revenue of nearly £15,000 sterling. There are five faculties—medical, legal, philosophical, and two theological (Protestant and Catholic). The university had, in 1886, 124 professors and lecturers, and 1331 students. Among its professors have been Niebuhr, A. W. Schlegel, Arndt, Welcker, Dahlmann, Hermes, and Simrock; whilst Albert, the Prince Consort, was a student here. It has a library of above 250,000 volumes, a splendid laboratory (1868), an art museum (1884), archæo-

logical and other collections, a botanic garden, and an observatory; there is also a celebrated agricultural academy. The manufactures—jute, soap, chemicals, &c.—are unimportant. Pop. (1871) 26,030; (1891) 38,505, chiefly Catholic.—Bonn derives its origin from *Bonna*, one of the Roman stations in Germany. From 1273 till 1794 the residence of the Electors of Cologne, it was held by the French 1673-89; in 1703 surrendered to Marlborough; was acquired by France in 1801, and by Prussia in 1814.

Bonnat, LÉON JOSEPH FLORENTIN, was born at Bayonne (1833), and studied at Madrid under Frederic Madrazo, and in Paris under Léon Cogniet. He gained the second *Grand Prix de Rome*, and, aided by his friends, went to Italy in 1858, where he resided for four years. He was first brought into notice by his 'Adam and Eve finding the Body of Abel' (1860), now in the gallery at Lille; and his 'Pasqua Maria' (1863) was much praised. He devoted himself to Italian *genre* pictures of moderate size, varied by such religious subjects as 'The Assumption' (1869), and the terribly realistic 'Christ on the Cross' (1874), commissioned for the Palais de Justice, Paris. He has produced many remarkable portraits, among others those of M. Thiers, Victor Hugo, Grevy, Pasteur, Dumas, Carnot, and Renan.

Bonner, EDMUND, Bishop of London, was born about 1500, of obscure and doubtful parentage. The reputation he gained at Oxford by his knowledge of canon law recommended him to the notice of Wolsey, who made him his chaplain, and promoted him to several benefices. His zeal in King Henry's service, after Wolsey's fall, earned him due promotion; and in 1533 he was deputed to appear before the pope at Marseilles, to appeal for the excommunicated monarch to a general council. His language on this occasion is said to have suggested to his holiness the fitness of having him burned alive, or thrown into a caldron of molten lead, so that Bonner judged it prudent to leave Marseilles without notice. In 1540 he was made Bishop of London, and as such pronounced sentence on several Protestant martyrs, though it is certain he did his best to befriend Anne Askew. After Edward VI.'s accession, he gave proofs of his lukewarmness in the cause of reformation, and at length, in 1549, was committed to the Marshalsea, and deprived of his bishopric. The accession of Queen Mary (1553) restored him to office; and by his part in that bloody persecution which has made her reign infamous, he rendered himself thoroughly unpopular. On Elizabeth's accession (1558), Bonner accompanied his episcopal brethren to salute her at Highgate, but was excepted from the honour of kissing her hand. In May 1559 he was summoned before the Privy-council, and refused, with a consistency worthy of respect, to take the oath of supremacy. He was accordingly deposed from his bishopric, and again imprisoned in the Marshalsea, where he died in 1569. The utmost allowance for Fox's exaggerations cannot free Bonner from the charge of persecution; though it seems that he did no more than his official position demanded, and that with such reluctance as to bring down on him the censure of the Privy-council (see Blunt, *The Reformation*, vol. ii.). And one should not forget that he was strict in castigating the lax morality of his clergy, that he remained steadfast to his principles, and that he bore his final misfortunes with manly resignation.

Bonnet, a covering for the head, of which there are many varieties. The French, from whom we have the word, apply it as we do to male as well as female head-dress. The *bonnet rouge*,

or 'cap of liberty' of the revolution, was shaped like a man's night-cap (*bonnet de nuit*). A felt cap of this shape, such as was worn by the Phrygians, was amongst the Romans the emblem of liberty, and was assumed by slaves when manumitted. The English bonnet of former times was made of cloth, silk, or velvet, more or less ornamented. It was generally superseded by the hat in the early part of the 16th century; but in Scotland, bonnets were commonly worn for two centuries later. The genuine old bonnet of the Lowland Scottish peasantry was of a broad, round, flat shape, overshadowing the face and neck, and of a dark-blue colour, excepting a red tuft on the top. The fabric was thick milled woollen, without seam or lining, and exceedingly durable. No head-dress ever invented could stand so much rough usage. This 'braid bonnet' very closely resembles the *bonnet Béarnais*, or *béret Basque*, of the south of France. From its having been worn, till comparatively late times, by small rural proprietors, these came to be called *Bonnet Lairds*. The Highlanders have long worn bonnets of the same fabric, but these generally rise to a point in front, with ribbons hanging down behind. Such is the cap known as the *Glengarry Bonnet*. The *Balmoral* is flat, and is like the Lowland bonnet. From time immemorial, these various kinds of Scotch bonnets have been manufactured at Stewarton and Kilmarnock, in Ayrshire. Except in the case of cavalry regiments, the Glengarry bonnet is in almost universal use as an undress cap in the British army and amongst the auxiliary forces.

Ladies' Bonnets.—Those made of the fine stunted wheat straw, grown for the purpose in Tuscany, and called Leghorn and Tuscan bonnets, are everywhere known to the female world. These have formed an important trade in that province for nearly two centuries. Split-straw plait and bonnets formed of it are made on a large scale at Luton and Dunstable (see STRAW MANUFACTURES). Willow-chip bonnets are made extensively in the neighbourhood of Modena. Bonnets, partly or entirely, of richer materials, such as horsehair, crape, velvet, and satin, with trimmings of feathers, lace, and artificial flowers, are made on a great scale in Paris. It is there that all novelties are created, and the annual value of its millinery exceeds a million sterling.

Bonnet. CHARLES DE, an eminent naturalist and philosopher, born at Geneva, 13th March 1720, was educated for the law, but devoted himself at a very early age to the study of natural history. A dissertation on aphides procured his election, in 1740, as a corresponding member of the French Academy of Sciences; and in 1743 he was admitted a Fellow of the Royal Society. At this time he was engaged in researches concerning polypi, the structure of the tapeworm, the respiration of insects, &c.; and in 1745 appeared his *Traité d'Insectologie*. His *Recherches sur l'Usage des Feuilles des Plantes* (1754) contained the result of much observation on important points of vegetable physiology. A severe inflammation of the eyes, putting a stop for two years to his researches in natural history, gave another direction to his studies, and he published several works on psychology, in which materialistic views decidedly prevail: the body is represented as the original source of all the inclinations of the soul, and all ideas are referred to movements of the nervous fibres; but his religious convictions remained always strong and unshaken, and in his *Idées sur l'État Futur des Êtres Vivants, ou Palingénésie Philosophique* (2 vols. 1769), he endeavoured to demonstrate the reasonableness of the Christian revelation. In this work he also maintained the future life of all living creatures,

and the perfection of their faculties in a future state. His *Considérations sur les Corps Organisés* (2 vols. 1762) is largely devoted to an examination of the theories of generation. He died on 20th May 1793. Collective editions of his works (8 vols. and 18 vols.) appeared in 1779 and 1788. See the monographs on him by Lemoine (1850) and the Duc de Caraman (1859).

Bonnet-piece, a gold coin of James V. of Scotland, so called on account of the king's head being decorated with a bonnet instead of a crown, as was usual. James V. was the first Scottish sovereign to place dates on his money, and to diminish the size of the gold coins by increasing their thickness. His bonnet-pieces were struck of native gold, and are now much prized by collectors. See Edward Burns' *Coinage of Scotland* (1888).

Bonnet-piece.

Bonneval. CLAUDE ALEXANDRE, COUNT DE, also called Achmed Pasha, a French adventurer, was born of a noble family at Coussac, in Limousin, on 14th July 1675; and entered the army in his thirteenth year. He served with distinction in Italy and the Netherlands, but for extortion and insolence was condemned to death by a court-martial. He fled to Germany, where he obtained employment in the Austrian service; fought against his native country, distinguished himself by many daring exploits, and bore a principal part under Prince Eugene in the war against Turkey. But during a residence at Vienna he made himself disagreeable to the prince, and was sent, in 1723, as master-general of ordnance to the Netherlands, where he quarrelled with the governor, was brought to trial, and condemned to death by a court-martial. The emperor commuted the sentence to one year's imprisonment, upon condition of his never afterwards setting foot on German soil. He went to Constantinople, became a Mohammedan, was made a pasha of three tails, and achieved success as general in the war of the Porte with Russia, and in Persia. The sultan appointed him governor of Chios; but his own imprudence, and the envy of others, caused his banishment to the shores of the Black Sea. He died at Constantinople on 27th March 1747. The memoirs published as his are spurious. See Prince de Ligny. *Mémoire sur la Comte de Bonneval* (1817).

Bonneville, NICHOLAS DE, one of the earliest French students of German literature, was born at Evreux, March 13, 1760. Early works are his *Nouveau Théâtre Allemand* (12 vols. 1782-85), a collection of German tales, and a translation of Shakespeare. After the revolution, he founded and edited several newspapers; but his moderation in tone and his liberality rendered him obnoxious to the ruling party, and on the fall of the Girondists he was thrown into prison. He also got into difficulties with Napoleon, and died November 9, 1828. His *Histoire de l'Europe moderne* (3 vols. 1789-92) and his *De l'Esprit des Religions* (1791) are still read.

Bonny, or BONI, a town and a river of Guinea, now in the British Niger protectorate. The river forms an eastern debouchure of the Niger, and falls into the Bight of Biafra, in about 4° 30' N. lat., and 7° 10' E. long. It is accessible at all times of the tide to vessels drawing as much as 18 feet of water, and safe anchorage at all seasons of the year is found within its bar. Its banks are low,

swampy, and uncultivated. On the east side, near its mouth, is the town of Bonny, notorious from the 16th to the 19th century as the rendezvous of slave-trading ships. The houses forming the town stand in a swamp where fever prevails; European traders generally take up their quarters on river-boats moored in the current of the Bonny. It exports considerable quantities of palm-oil.

Bonomi, JOSEPH, architect, was born at Rome in 1739, settled in England in 1767, became an associate of the Royal Academy, and died on 9th March 1806.—His son, JOSEPH BONOMI, the younger, born in Rome 9th October 1796, studied art in London, and became famous as a draughtsman, especially of Egyptian remains. He repeatedly visited Egypt and the Holy Land, and illustrated important works by Wilkinson, Birch, Sharpe, Lepsius, and other Egyptologists. He also published a work of his own on Nineveh, and at his death, 3d March 1878, he was curator of Soane's Museum.

Bonpland, AIME, an eminent traveller and botanist, was born at Rochelle, France, August 22, 1773. Having studied medicine and botany at Paris, he accompanied Humboldt in 1799 to South America, where they travelled nearly five years, during which time Bonpland collected 6000 new species of plants. After his return, he published several splendid and valuable botanical works. He went to Buenos Ayres in 1816, and was named professor of Natural History. Bonpland undertook an expedition of scientific discovery up the Paraná; but Dr Francia, then dictator of Paraguay, arrested him, and kept him prisoner for about nine years. He subsequently settled near San Borje, in the province of Corrientes, and died at Santa Anna in 1858. Among his works are: *Plantes Equinoxiales* (2 vols. 1808-16); *Monographie des Melastomées*, &c. (2 vols. 1809-16); and *Description des Plantes rares de Navarre* (1813-17). See his Life by Brunel (3d ed. Paris, 1872).

Bonspiel. See CURLING.

Bonstetten, KARL VICTOR VON, publicist, born at Bern, 3d September 1745, studied at Leyden, Cambridge, and Paris, entered the council of Bern, and became district governor, and in 1795 a judge in Lugano. He lived in Italy and at Copenhagen from 1796 to 1801, and after his return settled at Geneva, where he died 3d February 1832. Among his larger works are *Recherches sur la Nature et les Lois de l'Imagination* (Geneva, 1807), *Pensees Diverses* (1815), *Études de L'Homme* (1821), and *L'Homme du Midi et L'Homme du Nord* (1824), an examination of the influence of climate. Three volumes of his correspondence have been published.

Bonus (Lat., 'good'), an originally jocular use of the Latin word to mean 'a good thing,' specially for an extra dividend given to shareholders of a company from surplus profits, or a portion of the profits of an insurance company distributed amongst policy-holders. Sometimes used for a mere douceur or bribe.

Bony Fishes (*Teleostei*) form the most important sub-class of fishes, and include the vast majority of known forms, probably 8500 out of 10,000 species. They are the modern successors of the ancient fishes (*Palaichthys*), of which the direct survivors are now in the marked minority. The *Teleostei* appeared in all probability in the Chalk period, and have increasingly predominated over their gristly (*Elasmobranchs* or *Chondropterygii*) and heavily-armoured (*Ganoidei*) fore-runners. Many naturalists have found in *Ganoidei* the direct ancestors of the *Teleostei*; but this is

not allowed by our greatest modern authority—Dr Günther. They are, however, their geological successors.

In the bony fishes (*Teleostei*) the skeleton is bony, with completely formed vertebrae; the skin is usually clad in the characteristic light scales; the heart has a non-contractile swelling of the artery in front of the heart (the *bulbus arteriosus*); the gills are free and protected by a bony cover (*operculum*); the intestine has no spiral fold running down it; the nerves to the eyes simply cross one another, and do not fuse as they cross. Generally speaking, they are more active than their fore-runners.

Günther divides the bony fishes into six orders, and since these must be repeatedly mentioned, the following key, based on the same authority, and copied from Leunis' *Synopsis des Thierreichs*, is essential:

I. *Acanthopterygii*—e.g. perch, mullet, beryx, mackerel, bull-head, lump-sucker, goby, blenny, gray-mullet, stickleback.

II. *Acanthopterygii Pharyngognathi*—e.g. wrass.

III. *Anacanthini*—e.g. eel, ling, sand-eel, turbot, flounder.

IV. *Physostomi*—e.g. carp, minnow, flying-fish, pike, salmon, trout, herring, eel.

V. *Lophobranchii*—e.g. pipe-fishes and sea-horses.

VI. *Plectognathi*—e.g. file-fish, coffer-fish, globe-fish, sun-fish.

Gills comb-like.	Pre-maxilla and upper jaw movable.....	{ Spinous rays on dorsal, anal, and ventral fins.	{ Lower pharynx } bones separate ... I.
			{ United II.
			{ Ventral fin (if present) on throat or breast; air-bladder without duct. } III.
			{ Ventral fins posterior; air-bladder with duct IV.
			{ Pre-maxilla and upper jaw rigidly fixed to one another and to skull V.
Gills composed of small rounded lobes..... VI.			

For further information, see the article on FISHES, and separate articles; consult Günther's *Introduction to the Study of Fishes*, and Huxley's *Anatomy of Vertebrates*.

Bonyhad, a market-town of Hungary, in the county of Tolna, about 150 miles S. of Buda-Pesth. It has some trade in corn, wine, and tobacco. Pop. (1880) 5970.

Bony Pike (*Lepidosteus*), also called GAR-PIKE and GAR-FISH (distinct from the other Garfish, q.v.), a genus of Ganoïd fishes, found in widely distributed fossil form as early as Tertiary times, and still surviving in temperate America and Cuba. The fish measures at full size towards 5 feet in length, and is covered with a complete mail of lozenge-shaped enamelled and bony scales. The outer enamel layer is bright and glistening. The general colour is brownish-yellow or greenish with darker markings. The skeleton is completely bony, the vertebrae (like those of salamanders) convex in front and concave behind, the fins with accessory pieces known as 'fulera,' the dorsal and anal composed wholly of jointed rays, and situated far back. The snout is long and narrow, the mouth opening wide, the upper lip protruding beyond the lower, the dentition very well developed, with large catching and numerous small conical teeth arranged in rows. The paired fins are unlobed; the tail is markedly unsymmetrical (heterocercal). There are no spiracles, but accessory gills on the hyoid bones. The undivided

air-bladder is lung-like, opens into the gullet, and receives blood-vessels from the aorta. The dilated muscular chamber in front of the heart has eight transverse rows of valves. The bony pike or gar-fish lives in rapid rivers, swims with great force, has great flexibility in the neck region, and preys voraciously on other fishes. Formerly more widely distributed, it is now found in the fresh waters of North Central America and Cuba. Many species have been distinguished, but Günther only recognises three—*L. viridis*, *L. platystomus*, and the commonest *L. osseus*. The genus occurs as such in Tertiary strata, and is represented in earlier times by many forms (Lepidotidae, &c.). The flesh of the bony pike is esteemed for food. See GANOIDS.

Bonze, a modified Japanese word applied by Europeans to the Buddhist priests of Japan and of China.

Booby (*Sula piscator*), a species of Gannet (q.v.), which has received this name from its apparent stupidity in allowing itself to be knocked down with a stick or taken by the hand. Accounts differ very much, however, as to this character of the booby, some representing it as singular in not taking alarm nor becoming more wary even when it has had reason to apprehend danger from man; others, as Audubon, asserting in such a manner as apparently to place it beyond dispute, that it does learn to be upon its guard, and even becomes difficult to approach within reach of shot. The booby is not quite so large as its congener, the common gannet or solan-goose, but, like it, is a bird of powerful wing. It feeds on fish, which it takes by diving in the sea, observing its prey as it sweeps along in graceful and varying flight, sometimes

Booby.

at a height of only a foot or two from the surface of the water, sometimes twenty yards above it. The bird is sometimes taken, like the gannet, by means of a fish fastened to a board, through which it drives its bill, as it dashes at the bait. The booby is of a blackish-brown colour, whitish beneath; its colours are subject to some variation, and in young birds a general brown colour prevails; the sexes differ very little, except that the female is not quite so large as the male. The expansibility of the gullet enables the booby to swallow fishes of considerable size. The bill, which is straight, conical, and longer than the head, opens beyond the eyes, as in the rest of this genus. It is found on almost all tropical and sub-tropical shores, and sometimes even 200 miles from land. On the east coast of North America, it reaches about as far north as Cape Hatteras, but is much more abundant farther south, great numbers breeding on the low islands off the coast of Florida. The nest is often placed upon a low bush,

and 'is large and flat, formed of a few dry sticks, covered and matted with seaweeds in great quantity.' It contains only one egg or young one at a time. The booby is much persecuted by the Frigate Bird and Man-of-war Bird (q.v.), which are more powerful and of swifter flight, and often compel it to disgorge for their use the prey which has just been swallowed. The flesh of the booby, although sometimes eaten by sailors, is dark coloured, and not very agreeable.

Booby Island, a level rock in Torres Strait, in 10° 36' S. lat., and 141° 53' E. long., 3 feet above high water, and $\frac{1}{4}$ mile in diameter. Being dangerous to navigators, and destitute of resources of its own, it is pretty regularly supplied with provisions and water by passing vessels, for the benefit of shipwrecked sailors.

Boodroom. See BUDRUM.

Book. The volume which the reader has at present in his hands is a normal specimen of what is now understood by a printed book. Printed matter occupies both sides of a certain number of leaves of paper, which are so arranged that, beginning at the upper end of the left side of the first page, he may proceed without dislocation of thought always from left to right till he reach the lower end of the last page. The first page or *recto* of the first leaf or *folio* (often omitted, as in the present work), containing usually an abbreviated form of the title, is technically known as a *bastard* or *half title-page*; the next page or *verso* of the first folio is left blank. Then follows the *title-page* proper, usually with a blank page at the back. In many books there intervenes a preface or introduction, a dedication, and a table of contents before the main body of the book begins. If any portion of the book has got out of its place, there are two ways by which the true order can be discovered. At the outer corner of each page is a number—1, 2, 3, &c.; this is the pagination or numerical order of pages. At the left-hand foot corner of page 1 is the number 53; and 54 will be found similarly on page 17. The sixteen pages thus indicated have been produced by the folding of a single sheet of paper. Fifty-three is the signature (as it is called) on the first page, because 52 sheets have been used in the previous volume. A, B, &c. are often used for numerals; and if the book goes beyond the number of letters in the alphabet, the series is continued—A A, B B, &c., or 2 A, 2 B, &c.

To understand the historic origin of this normal modern book, we must go back to a remote antiquity. The word 'book' itself (Saxon *boe*, Ger. *buch*, Dutch *boek*) appears originally in Gothic as a plural noun meaning primarily, as is generally believed, the runes inscribed on the bark of separate branches of the 'beech' tree (Saxon *boe*, Ger. *buche*, Dutch *beuke*) for the purposes of divination, &c. *Liber*, the Latin equivalent (which has been adopted by all the Romance and Celtic tongues—Fr. *livre*, Ital. *libro*, Gaelic *leabhar*, Welsh *leor*—and is the source of our English word *library*), properly meant bark, and was applied to prepared papyrus tissue from its bark-like appearance. The Greek *biblia*, in like manner, is associated with *byblos*—i.e. papyrus.

As is now well known, the ancient Babylonians and Assyrians had a wide and varied literature. This was preserved in two ways: either painted on the leaves of the papyrus which grew in abundance on the banks of the Euphrates, or impressed on clay shaped into tablets or cylinders. Such skill was displayed in the treatment of this latter material that the inscribed characters by their minuteness 'suggest that they must have been written with the help of a magnifying glass.' A representation of a typical polygonal Assyrian

cylinder will be found in Sayce's *Assyria* (1885). The defects, as well as certain advantages, of this form of 'book' are obvious. It has no direct connection with the modern European book. The case is different, however, with the ancient Egyptian book. The sequence may be maintained from the volume at present in the reader's hands back for thousands of years to the oldest Egyptian 'volume' still extant (in a sense the oldest book in the world)—the *Papyrus Prisse*, which must be assigned to a very early period of Egyptian history, according to Chabas and to Virey, *Études sur le Papyrus Prisse* (Paris, 1887), to a date probably prior to the XII. dynasty—i.e. at least 2000 B.C. Owing to its wonderful adaptability to literary purposes, the prepared papyrus tissue (see PAPHYRUS) spread to Greece (at least before the time of Herodotus) and to Rome; and though it was so far supplanted, especially in certain regions, by the finer kinds of prepared skins—the material used by the Jews, Persians, and other oriental nations—it maintained its position as a book-material down to the 10th century A.D. Ali Ibn el Azhad in 920 describes the different kinds of pen required for writing on paper, parchment, and papyrus (see Dr Joseph Karabacek's *Das Arabische Papier*, Vienna, 1887). The ancient papyrus-book, whether Egyptian, Greek, or Roman, was got up very much like a modern mounted map. A length of the material, written on one side only, was fastened to a wooden roller, round which it was wound; this formed a *toma* (Egyptian), *kulindros* (Gr.), or *volumen* (Latin); hence our 'volume.' Specimens of Egyptian rolls still exist, extending to upwards of 20 and even 40 yards (see Birt, *Das antike Buchwesen*, page 439); but the great inconvenience attaching to the consulting of such enormous scrolls (though we still find similar pedigree rolls in England—e.g. at Helmingham, Suffolk) made it much more usual to break up any lengthy literary production into sections, each on a separate roll. Certain suitable sizes became normal, and this conventional length of the roll exercised a considerable influence on the length of what are still called the 'books'—i.e. divisions of the classical authors. In Egypt the rolls were kept in jars (holding say nine or ten each); in Rome in wooden boxes or canisters (often of costly workmanship), or in parchment cases. The change from the rolled to the folded form of book appears to have taken place in the ancient world after the adoption of parchment or vellum, though practically the same arrangement of successive surfaces had been in vogue in the books or tablets of waxed wood used for notes and letters. *Codex*, the Latin name for such a parchment volume, is still retained as the designation of the more important ancient MSS., as *Codex Alexandrinus*. The form remained practically unaltered throughout the middle ages, and being even more suitable for paper than for vellum, was ready on the invention of printing to facilitate its full development. For details in regard to the ancient MS., see PALEOGRAPHY. For Book-books, see WOOD ENGRAVING.

Sizes of Books.—The vellum, and afterwards the paper book of mediæval times, was made up in the following way. 'Quires' or 'gatherings' were formed sometimes of four sheets folded in the middle and placed one within the other, so as to furnish eight leaves, sometimes of five sheets yielding ten leaves, sometimes of six yielding twelve. These groupings were known as quaternions (*tetradia*), quinterns or quinternions (*pentadia*), and sexterns (*hexadia*). This same method was adopted by the early printers, who at first indeed only printed as the copyists had written, one page at a time. In the colophons (see below) of many of the older books, a register or collation, as it is called, of all the quires—whether

termions, quaternions, or so on—is supplied for the guidance of the bookbinder. The signatures on the several quires were at first inserted by hand, and were first printed at Cologne in 1472. When it became usual to print a certain number of pages at once, the paper was not folded and cut up till it had passed through the press. The number of times it required to be folded afforded a ready means of distinguishing in a general way the different sizes of books as long as the paper continued to be made by hand, in frames the size of which did not greatly vary. The nomenclature is still in vogue, though it has ceased in these days of machine-made paper to be a correct guide to the real sizes of books. In America, the proposal to distinguish sizes by an actual measurement of height and breadth of paper has met with some acceptance; but the old fashion still prevails in Europe. A sheet being folded in the middle forms two leaves or four pages; and a book composed of such sheets is styled a folio whether it measure $1\frac{1}{2}$ feet or 4 feet in height. When the sheet is again folded it makes a quarto. In hand-made paper (i.e. the paper used in nearly all books of purely bibliographical interest) the water-line runs either across or down the page according to the number of foldings. The following scheme is serviceable:

Folio, folded.....	1	time = 2	leaves, water-line perpendicular.
Quarto.....	4to	2	times 4 " " horizontal.
Octavo.....	8vo	3	" 8 " " perpendicular.
Duodecimo.....	12mo	4	" 12 " " horizontal.
Octodecimo.....	18mo	5	" 16 " " perpendicular.

Less ordinary, and of course diminutive, sizes of books are produced and known as 32mo (water-line perpendicular), 36mo (horizontal), 48mo (horizontal), 64mo (horizontal), 72mo (perpendicular), 96mo (perpendicular), 128mo (perpendicular). In this country for a long period printing-paper was chiefly of three sizes—royal, demy, and crown; and according as any one of these was employed, the size of the book was large or small. Demy, however, was the most commonly used; and the demy 8vo may be said to have become the established form of standard editions. The size of the present work is imperial 8vo. Among books, as among men, there are giants and dwarfs. Certain church-books in the Escurial are described as 6 feet in height by 4 in breadth; and the 'Antiquity' volumes, for example, of the Napoleonic *Description de l'Égypte* measure $3\frac{1}{2}$ inches in height. The 'Thumb Bible' is, on the other hand, not much bigger than a postage-stamp; Pickering's Diamond edition of *Tasso* measures $3\frac{1}{2}$ inches high by $1\frac{1}{2}$ wide; and Hoepfi's 1878 *Divina Commedia* is less than $2\frac{1}{2}$ inches by $1\frac{1}{2}$.

Colophons.—The scribes employed by Assur-bani-pal (680 B.C.) used to place the account of their documents at the close of the last column on their cylinders. In like manner, the early European printers often gave details about their books in the closing paragraph, now technically known in English as the *colophon* (from a Greek word for apex or terminus), in French as *souscription*, in German as *Schluss-schrift*. Caxton varies his colophon from the simplest *Explicit, Hic finis*, or 'Here endeth,' to elaborate epilogues or post-faces. Quaintest of all, perhaps, is his rhyming conclusion to the *Moral Proverbs*:

Go thou litil quayer | and recõmaund me
Unto the good grace of my special lorde
Therle Ryneris, for I have emprinted the
At his cõmandement, folowynge enry worde
His cõpye as his secretaire can reorde.
At Westmestre of feuerer (February) the xx daye
And of Kyng Edward the xviij yere vraye (truly)

Abundant examples of the colophon will be found in Mr Blades's *Caxton*, and Legrand's *Bibliographie Hellenique* (1885).

Title-pages.—Though Caxton's work affords no

instance of a title-page—unless *The Chastising of God's Children* (1491?) be his, and it contains simply three lines of ordinary print—this does not represent the general stage of typographic development. As early as 1474 Pictor, Loslein, and Ratdolt in Venice issued a *Calendario* by John de Monteregio, with a quaint rhyming title-page, with place, date, and names at the foot (see fac-simile in Bouchot, *The Printed Book*). With the adoption of the title-page, the colophon naturally disappeared, though instances are found well into the 16th century. The treatment of the title-page has varied enormously at different periods: in the 16th and 17th centuries becoming at times so crowded with details as to lose half its value as a ready means of determining the purport of the book. Laudatory descriptions of the author and his work were freely introduced: 'Very necessary to be known'; 'Very pleasant and beneficial'; 'A book right rare and strange,' are among the phrases familiar to all book-lovers. Except in the case of works of fiction and popular theology, the tendency of the present time is to make the title brief and business-like. Dickens's *Adventures of Oliver Twist* even contrasts curiously with the title-page of the first edition of, say, *Robinson Crusoe*. Metaphorical titles (so abundant in the Elizabethan and Jacobian periods) are serviceable as distinctly individualising a book, but are very apt (as in Mr Ruskin's *Notes on the Construction of Sheepfolds*) to mislead the unwary. Double titles (as in Mr Ruskin's *Proserpina: Studies of Wayside Flowers*) are equally dangerous; and open to strong objection is the habit of re-issuing an old work with a new title. The title of a book is by English law as much the property of an author as any other part of his book. Consequently, a lawsuit may be the result of even unsuspectingly using a title already appropriated (see COPYRIGHT). Compare the fac-simile title-pages in Könecke, *Bildertatlas* (1887); Le Petit, *Principales Editions originales d'Ecrivains Français* (1888); and A. Lang, 'Old French Title-pages' in *Books and Bookmen*.

Dates.—In the dating of their books the early printers, like the scribes, were extremely negligent. 'Of twenty-one works,' says Mr Blades (*Caxton*, i. p. 31), 'known to have issued from the press of Colard Mansion, not more than five have any date to them; and of nearly one hundred publications attributed to Caxton's press, considerably more than two-thirds appear without any year of imprint.' At other times we find the date given with great precision: thus, *The Book of the Knight of the Tower* has 'and enprynted at Westminster the last day of Janyuer, the fyrst year of the regne of Kyng Richard the thryd.' In the present day nearly all respectable publishers put the correct year in which their books are issued at the foot of the title-page, either in ordinary figures or in the Roman notation. When a book is not dated, one suspects a desire on the part of the publisher to sell his old stock as if it had newly seen the light. Unfortunately, the device of attaching a new title-page with a fresh date to matter that has lain in the warehouse for many years is adopted by firms whose reputation ought to be above reproach. The following are among the more important deviations from the normal methods of Roman notation to be found in the colophons or title-pages of early printed books (see Brunet, *Connaissances nécessaires à un Bibliophile*):

M CCCciii XX VIII = 1488 (i.e. 1000 + 400 + 4 × 20 + 8).

M iii Ciiii XX Viii = 1488 (i.e. 1000 + (4 × 100) + (4 × 20) + 8).

M CD XCV = 1495 (i.e. 1000 + (500 - 100) + 95).

M iiij D = 1496 (i.e. 1000 + 500 - 4).

M IIID = 1497 (i.e. 1000 + 500 - 3).

CIO IO CXX VI = 1626 (i.e. 1000 + $\frac{1000}{2}$ + 100 + 26).

In many cases the older printers indulged in

curious chronograms; sometimes using them to repeat in the preface a date already distinctly stated on the title-page. An extreme instance is the *De spiritali Imitatione Christi sacra et vtilis pili In LVCEM Data, a R. P. Antonio Vanden Stock Societatis Jesu, Ruemunde, Apud Gasparem du Pres*—a book which contains upwards of 1500 chronograms on the date 1658 (see CHRONOGRAM); and James Hilson, *Chronograms, 5000 and more in number* (4to, Lond. 1882); and *Chronograms Continued* (1885).

When dates are wanting, the age of a book may often be approximately determined by certain external characteristics, which must, however, be used with caution. Watermarks (Ger. *wasserzeichen*; Fr. *filigranes*), for example, are of importance, but their evidence has been frequently strained. Compare article PAPER; and see the works of Fischer (1804), Boyer (1860), Midoux and Matton (1868), and Sotheby's *Principia Typographica*.

Place of Publication.—Even when the name of the place of publication is given in full, it may require some knowledge to recognise it under the several forms current in different languages and at different periods. Thus Cologne may appear as Colonia, Colonia Agrippina, Cueln, Ceulen, Keulen, Köln, &c.; or the periphrasis in civitate Colōiensi may be employed, the *n*'s being represented by strokes above the vowels (see PALEOGRAPHY); Venice may be more or less disguised as Venetia, Venetia, Venezia, Venedig (German), Wenez (in the local dialect), Enetia (in Greek), and Mleczi, Bnezieh, Mnezik, and Mljetka (in Slavonic). Well-known places may be concealed under some pseudo-classical translation of, or pun upon, the true name; thus, Herbilopolis stands for Würzburg; Leucopetra for Weissenfels; Probatopolis for Schaffhausen; Eleutheropolis for Freystadt, Francheville, Francavilla, &c. This latter is a good instance of a difficulty that may arise. Not only may Eleutheropolis represent one of many towns, but from the meaning of the word it has frequently been employed by printers who did not wish to declare the true place of publication. Another instance is Irenopolis ('City of Peace'), which is historically an equivalent of Berœa. The following list will be convenient: Argentoratum, Strasburg; Augusta Vindelicorum (often only Augusta), Augsburg; Basilea, Basel; Bipontum, Deux-Ponts; Bononia, Bologna, or Boulogne; Cadomum, Caen; Caesarangusta, Saragossa; Cantabriga, Cambridge; Corona, Cronstadt; Dortracum or Dordrechtum, Dort; Eboracum, York; Gippesvicum, Ipswich; Grati-anopolis, Grenoble; Hafnia, Copenhagen; Hala, Halle; Holmia, Stockholm; Insula or Insule, Lille; Ispalis, Seville; Leodicum, Liège; Lipsia, Leipzig; Lugdunum, Lyons; Lugdunum Batavorum, Leyden; Lutetia, Paris; Massilia, Marseilles; Matisco, Macon; Mediolanum, Milan; Moguntiacum, Mainz; Mons Regalis, Mondovi; Mussipons or Pontinussum, Pont-à-Musson; Neapolis, Naples; Neapolis Casimiri, &c., Neustadt an der Hardt; Cenipons, Innsbruck; Olisipo, Ulyssipol, Ulyssipolis, Lisbon; Oxonia, Oxford; Petropolis, St Petersburg; Regiomontium, Königsberg; Rotomagus, Rouen; Sarum, Salisbury; Tarvisium, Treviso; Tornacum, Tournai; Trajectum, Utrecht; Treac or Civitas Tricassina, Troyes; Tridentum, Trent; Turoni, Tours. See *Dictionnaire de Géographie Ancienne et Moderne à l'usage du Libraire* (Paris, 1870).

To divert suspicion, printers have often put totally erroneous names on their title-pages; hundreds of European books bear to have been issued at Pekin; thousands of the products of the Parisian presses claim The Hague (La Haye) or some other

Dutch town as their birthplace. Quite recently Burton's literal translation of the *Arabian Nights* bears to have been printed at Benares. In the earlier centuries printing and publication were so much the same thing that to know the place where a book was printed was practically to know where it was published, and *vice versa*. At present it is not uncommon for a work to be printed in one country and published in another. When publishing firms have houses or agencies in different cities, all may be mentioned on the title-page, and precedence accorded rather in keeping with the importance of the cities. Thus, 'London and Edinburgh' frequently appears in books which were entirely produced in the lesser city. With the introduction of stereotype or electrotypes plates it has become possible for a book to be printed in more places than one with only one setting-up of type. See Weller, *Die Falschen und Fingerten Druckorte* (1864).

Pageination.—At first the printed book was issued like the manuscript without any numbering of the pages. Before long it was found convenient to number the leaves; the numbering of the pages followed. In many modern books, when the page contains two or more columns, each column is numbered consecutively. When a book consists of several volumes, each has usually its own pagination; but in some great treatises running through several volumes, it expedites reference from the index to number right through from the beginning to the end of the whole series. In the old folios and quartos letters were not infrequently inserted on the margin, so as to break each page into distinct portions without interfering with the continuity of the text. The marginal letters from the first editions of the classics are often reproduced in modern editions just as they originally stood, and form a convenient method of reference.

Preface, &c.—The *Preface* is the introductory address of the author, in which he explains the purpose and scope of his book, and, as it were, introduces himself to his readers. Our ultra-Saxonists prefer to call it a 'foreword,' in keeping with the German *Vorwort*. Formerly it was usually headed *To the Reader*, *To the Gentle Reader*, *To the Courteous Reader*, &c.

In the times when the professional author depended largely on the patronage of some person of rank, the *Dedication* was an integral and indispensable part of a book. If he made sure of his Mæcenæ he could let the many go. At present being for the most part a mere expression of personal esteem or affection, the 'I dedicate' has become as simple in form as in the 17th and 18th centuries it was elaborate with all the rhetorical artifice to which flattery could attain.

Pictorial Imprints or Printers' Devices.—One of the happiest passages in the *Book Hunter* deals with the trade emblems of the old printers. The subject on which it merely touches has been treated at length in such works as Silvestre's *Marques Typographiques* (2 vols. Paris, 1867); Roth-Scholtz's *Thesaurus Symbolorum ac Emblematum, ut est, Insignia Bibliopolorum et Typographorum* (Nürnberg, 1730); Berjeau's *Early Printers' Marks* (Lond. 1866). It is enough here to mention the boldly drawn three-mast ship of Mathis van der Goes, Antwerp (1472-94); the windmill of Andrew Myller, Edinburgh (1508, &c.); the curious wild men and fruit-laden tree of Thomas Davidson, Edinburgh (1541); the olive-tree of the Stephensens; and the sphere of the Elzevirs. In many instances there is a punning allusion to the printer's name: Frosehoever has his frogs (Frosch in German), and Le Chandelier his seven-branched candlestick; Nicholas Eve gives us a picture of the presentation of the forbidden fruit. Others

make use of the arms of the cities in which they worked. Leeu shows the castle of Antwerp,

R. Hall the half-eagle and key on a shield of Geneva, Stadelberger the lion rampant of Heidelberg and the shield diapered of Zurich, &c. Ascensius (1462-1532) has bequeathed to posterity the lively and accurate representation, down to every nail and screw, of the press in which the great works of the 16th century were printed, with the brawny pressman pulling his proof.

His device with the inscription *Prelū Ascensianū* was adopted

by Josse Bade, Paris (1501-35), who added his initials at the foot; by De Gourmont (1507-15); Le Preux (1561-87); and in a modified form by De Marnef (1567) and De Roigny (1565). The anchor and dolphin of the Aldi was employed by Turrian, De Chenney, Brillard, Tardif, Coulombel, sometimes, as in the last instance, with the divided Aldus.

Decoration of the Book.—Leaving out of view the pictorial illustration devoted to the elucidation of the subject treated of in a book (see ILLUSTRATION), there are certain forms of illustration which are merely decorative appendages to the book itself. Besides the ornamental treatment of the title-page with peculiar letters, the use of red or blue ink, and the insertion of a printer's emblem or some appropriate vignette, we must mention the engraved title-page (in the 16th and 17th centuries often a most elaborate and costly piece of work), the frontispiece or engraving placed opposite the title-page; ornamental initial letters for chapters; headpieces or vignettes for the blank space generally left before the beginning of a new chapter; and tailpieces at the end of the chapters. The amount of artistic effort lavished on these apparent trifles will best be understood by consulting Niedling, *Bücher-ornamentik* (1888); Bonehot, *The Printed Book*; and Austin Dobson's chapter in A. Lang's *The Library* (see also the works *supra* at 'Title-pages'). By the earliest printers the insertion of decorative details was left to a special artist—the rubricker (so called from the red ink which he mainly employed).

Imprint of Caxton.

Imprint of Gaspard Philippe, Paris (1500-10).

Space was often left for his initial letters, and at most only a small letter inserted to guide him.

In describing second-hand books various technical expressions are employed. *Black Letter* is explained in a separate article. *Uncut* means that the original size of the paper has not been reduced by cropping the edges, not, as is often supposed, that the paper is still in the sheet, a condition for which there is no generally accepted term. The French use *non coupé* in this latter sense, and for 'uncut' *non rogné*. *Foxed* means that a book is damaged by brown or yellow spots. *Curious* is used euphemistically for 'improper.' 'Unique,' 'rare,' and 'very rare,' require no explanation, but should be accepted with caution. Many books originally printed in thousands (e.g. school-books) have become rare and even unique in course of time; others have been so from the first through the intentional limitation of the numbers issued. A common device to enhance the market value of a book is to issue only a few copies and promise to destroy the plates. Thus the word edition conveys no idea of number. See Egger, *Histoire du Livre* (Paris, n.d.); Bouchot, *The Printed Book* (1887).

Bookbinding is the art of connecting together in a durable and convenient manner the several parts of a book. Before the invention of printing, the binding of manuscript books, which in those days consisted chiefly of Bibles, Psalters, Books of Hours, and other works of an ecclesiastical character, was performed by various orders of monks, who prepared the books up to a certain point ready for ornamentation by the goldsmith and jeweller; and the earliest works from the press were at first printed and bound in direct imitation of these manuscript volumes. Fig. 1 is copied from the side

Fig. 1.

of a Book of Hours bound in the early monastic, or, as it is commonly called, Byzantine style, with a figure of Christ carved on an ivory plaque in the middle, surrounded by gold filigree work and sixteen jewels. It was not till the end of the 15th century, when the printing-press had become common in Italy, that binding took rank as an art by itself, and it was probably in the workshops of Aldo Manuzio (Aldus), the famous printer of Venice, that decorative art of the highest character was first applied to the ornamentation of book-covers. There are in the National Library at Paris, books bound for an Italian connoisseur named Tommaso Maioli, and for another celebrated

bibliophile, Jean Grolier of Lyons (1479-1565), at one time treasurer to the Duke of Milan, which are unsurpassed in beauty of design and workmanship at the present day. This taste for artistic book-binding soon spread to France, where the king and the richer among the nobility vied with each other in the possession of handsome bindings. Louis XII. and his queen, Anne of Brittany, both possessed fine examples, probably of Italian workmanship. Henry II. and Catherine de Médicis were perhaps the most enthusiastic royal patrons of the art, and the king's favourite, Diana of Poitiers, had probably the finest collection of splendidly bound books that was ever got together. Henry III., who was also a great lover of books, was afflicted with a peculiar mania for all kinds of emblems of death, and carried it so far as to cause the well-known death's head and cross-bones to be introduced on the bindings of his books; it thus became very easy to recognise volumes which had once formed part of his library. Jacques Auguste de Thou (Thuanus), president of the parliament, and a great friend of Grolier, was another celebrated collector of sumptuously bound books of this period.

It is in the reign of Henry III. (1574-89) that we learn for the first time the names of the binders who were employed in the royal service. Among these, Nicolas and Clovis Eve were the most celebrated. They were the first to introduce the style known as *fanfare*, with geometrical patterns filled in with sprays of leaves, palm branches, and other foliated forms.

In the middle of the 17th century we meet with the name of Le Gascon, probably the by-name of Florimond Badier, whose work merits great praise. The peculiarity of his ornament, known as *pointillé*, consists in filling in a geometrical outline with innumerable minute gold dots, often thus forming very pleasing patterns. At the end of this century the most famous workmen of the craft were Duseuil, Padeloup, and Derôme, who faithfully carried on the tradition of their predecessors. A famous binding attributed to Nicolas Padeloup is that figured in our engraving (fig. 2), a *Daphne et Chloé*

Fig. 2.

of 1718, with the arms of the then regent of France, the Duke of Orleans.

During the 19th century, bookbinding continued to preserve its rank as a fine art, especially in France, where the most elaborate work, executed with the greatest care and skill, and often

very beautiful in result, is more sought for than in other countries.

In Germany and the Netherlands most of the books were originally bound in vellum, calf, and pigskin, many of them stamped with ornament in blind-tool (i.e. without gold), and for a few years after printing was invented, the decorative art generally employed was of the most primitive description. In the 17th century, many very elaborate blind-tooled bindings were executed; and during the last half-century, German binders have awakened from their long sleep, and we now see work issuing from Berlin and Leipzig that deserves unqualified admiration.

In England the history of the art is obscure, and, though it must have been extensively practised, the names of few of its followers are known. Julian Notary, in the reign of Henry VII.; John Reynes, in the time of Henry VIII.; John Gibson of Edinburgh, in the reign of James I.; and Roger Payne, at the end of the 18th century, are those which have chiefly survived. Of the work of many English binders of the end of the 18th and beginning of the 19th century, Baumgarten, Kalthoer, Bohn, Staggemeir, and others, it is impossible to speak too highly. They were succeeded by Hering, Lewis, Mackenzie, Hayday, Rivière, Bedford, Zaehnsdorf, and other excellent binders; and there are at the present day members of the craft whose names will go down to posterity among those of the most celebrated of their brethren.

Bookbinding may be divided into two classes—viz. case binding or 'cloth-work,' and leather or 'bound work.' The former was introduced by Pickering, the publisher, and Leighton, the binder, in 1822. Before that time books were issued by the publishers bound in millboards covered with coloured paper. In both France and Germany most books, even the finest, are originally issued in paper covers; whereas in England the whole edition often appears in cloth binding. As the latter is that most generally used for ordinary books, it may be first described.

Books are usually supplied to the binder in sheets of sixteen pages, that being the number most easily folded. If for convenience they are printed in larger sheets of thirty-two or sixty-four pages, then these are cut into the proper size before going to the binder. Each sheet has its pages arranged (see PRINTING) so that, when folded, they will follow one another in their proper order; and on the first page of each sheet is a letter called its *signature*. The first sheet of a book is A, the second B, and so on. The sheets are folded either by hand or by any one of a variety of ingenious machines which do the work with great expedition and accuracy. When folded, bundles of the different sheets of the book are laid in order on a table, and a sheet is 'gathered' off each bundle till a book is completed, and so on till the number of books is finished. The separate books are then collated or revised to see that the signatures follow each other in proper order. They are then pressed in a machine to give them a little solidity, and being put straight, are passed over a table having three or four (according to the size of the book) circular saws projecting slightly, which make shallow cuts across the back. The cuts make holes in the sheets, through which they are stitched on a cord which is placed in the saw-cut. The stitching is either done by hand in a frame on which the cords are stretched, or by one of the clever machines which have been invented for the purpose. Some of the machines sew the sheets on tapes, in which case the sawing is dispensed with. The cords or tapes on which the books are sewed are cut with a little piece, half an inch or so, left projecting, and

this, after the end or 'waste' papers are tacked on with paste to each side, is pasted down on the outside sheet. The work up to this point is executed by girls. The sewed books are taken to the *forwarders*, who commence operations by cutting the edges by means of a 'guillotine,' after which any ornamentation of the edges, such as sprinkling with colours, marbling, or gilding, is applied. They are then rounded on the back by hammering on a plate, and put into a press which forces a piece of the back over the sides, forming shoulders, called the joints, which grip the case. A piece of thin canvas being glued over the back, with a portion overlapping, the book is ready for the case, which has meanwhile been also in preparation. The case consists of two pieces of millboard, cut to the proper size by a most ingenious machine, which, like the greater part of the machinery used in bookbinding, is of American invention; the boards are separated by a piece of paper of the proper width to form the back of the book, and the whole covered with specially prepared cloth of any desired colour. The cases are made with great expedition by three or four girls working in concert. The ornamentation of the case is next executed. This varies from the simplest lettering or title on the back or side to the most elaborate decoration specially designed by artists who study that branch of art. This may be stamped in gold, ink of various colours, or blind (i.e. plain), or a combination of all three. The designs are engraved on brass, the gilt portion on one piece, the ink or blind on another, and stamped on the case by means of a press worked either by hand or steam. Where gilt work is intended, gold-leaf is first put on the case, and after being impressed by the stamp, which is kept hot when in use, the superfluous gold is rubbed off, the parts stamped only adhering to the case. The ornamentation of cases is capable of an infinite variety of modifications. When the case is ready, the outside end-papers of the book are pasted, including the pieces of cord and canvas already mentioned; the case is carefully placed in the joints, and the whole placed in a hydraulic press till dry, when the binding is finished.

Leather or bound work differs from case work in the essential particular that the boards are put together *on* the book. The sewing is much similar to that already described, except that it is more carefully done, and the cords are stronger, and longer pieces are left. The *forwarder* hammers the back round and forms the joint by hand, laces the ends of the cords through the boards, and pastes them down securely. The edges are then marbled or otherwise ornamented, and *headbands*, ingenious arrangements to strengthen the top and bottom of the back, are worked on. After lining the back with strong brown paper, little strips of pasteboard to form the back into panels are stuck on, and a piece of leather, very carefully prepared, with the edges pared thin, and cut to a proper size, is pasted over the whole cover, with about an inch turned over the boards. The work is then handed over to the *finisher*. In his hands the leather is sized with diluted paste, varnished with *glair* made of white of egg, and the gilt ornamentation, lettering, &c., is executed by hand tools at his discretion. This part of the process demands great skill on the part of the workman, who should have the instincts of an artist. In 'calf' binding, a differently coloured piece of leather is generally pasted on the title panel, but in 'morocco' work this is dispensed with. During the finishing process a book may pass through the workman's hands as many as thirty or forty times, a separate operation being performed every time.

In half-binding, a strip of leather is glued or pasted over the back of the book and reaching

about an inch and a half on the board on each side; a triangular piece of leather is usually pasted over the corners to strengthen them. The cloth or paper to cover the sides is then put on and turned over the boards, the marbled or otherwise ornamented end-papers are pasted on the inside, and after being pressed, the book is finished. What is called Roxburghe binding is simply half-binding in morocco, without leather corners; generally with the top only gilt.

In magazine parts, or other books covered in paper, the sheets are stitched together and the paper cover pasted on the back. Sometimes they are fastened with two or three wire-stitches clamped through by means of a machine. In what are called 'limp' books—i.e. books with thin boards which do not project beyond the leaves, the cloth is generally pasted over a paper cover stitched along with the book, and the edges cut afterwards.

There are several divisions of the bookbinding profession. Where publishing is on a large scale, as in London, Edinburgh, New York, and Philadelphia, binding for publishers, which is principally cloth-work, is carried on in extensive factories, fitted up with costly and elaborate machinery driven by steam. The binding of account-books is a separate branch called 'stationery binding.' Other binders devote themselves to fine art binding; others to paper-work; others again to Bibles and Prayer-books exclusively. In all, however, the same three requisites, solidity, elasticity, and elegance, are necessary to a well-bound book. The marbling of edges and the preparation of end-papers is a separate industry.

Bouchot, *Les Reliures d'Art* (1888); the fac-similes of Mr Gibson-Craig's Collection (1892); Thoiman, *Les Relieurs Français* (1893); Halfer, *Die Fortschritte der Marmorier Kunst* (1891); *Bookbinding Ancient and Modern*, by the present writer (1881); and works on the subject by J. B. Nicholson (1882), J. W. Zachusdorf (1889), 2d ed. 1890, W. Salt Brasington (1893), and Herbert P. Horne (1894). See also the articles BOOK, ILLUMINATION, ILLUSTRATION, &c.

Book-club is either (1) an association for purchasing and reading new books as they issue from the press, or (2) an association for the printing of books relating to some special branch of inquiry. The importance of the former kind of book-club has greatly diminished in Britain since the general establishment of circulating libraries after the style of Mudie's in London. The present article deals with the printing book-club only. The oldest is the Cymmrodorion or Metropolitan Cambrian Institution, founded in 1751, and reconstituted in 1820, and again in 1877. The still earlier Dilettanti Society (1734) is also a kind of book-club, its *magnum opus* the *Antiquities of Ionia* (4 parts, 1769-1882). But the practical prototype of the true book-club was the Roxburghe, instituted (17th June 1813) in commemoration of the sale of the Duke of Roxburghe's library, and more especially in honour of the Valdarfer *Boeccaccio*. At first the club was largely convivial, its dinners costing sometimes £5 or £6 a head; though it was understood that each member was to be at the cost of reprinting as many copies of some scarce work as there were members in the association—the chairman's copy to be on vellum. The first issues were quite trivial; and the solid work of the club began only with Sir Frederick Madden's *Romance of Havelok the Dane* in 1828. It was the Bannatyne Club (q.v.), founded by Sir Walter Scott in 1823, which began the regular issue of really substantial productions. The Camden Society introduced the method, now universal, of taking an annual sub-

scription from each member, instead of leaving the whole expense of a book to be defrayed by one individual; and thus, among other advantages, secured a more equal standard of excellence. Omitting learned societies which publish only Proceedings and Transactions, the following is a brief list of the more important book-clubs and book-printing societies of Great Britain: Maitland Club (Glasgow, 1828-59), after Sir Richard Maitland of Lethington, works illustrative of Scottish history, antiquities, and literature; Oriental Translation Fund (1828-58); Iona Club (Edinburgh, 1833-38), history, antiquities, and early literature of Scottish Highlands and Islands; Surtees Society (Durham, 1834), after Robert Surtees of Mainsforth, manuscripts dealing with the Northumbrian region; Abbotsford Club (Edinburgh, 1834-37), history, literature, and antiquities, English and Scottish; Camden Soc. (Lond. 1838), civil, ecclesiastical, and literary history of the United Kingdom; Spalding Club (Aberdeen, 1839-70; revived 1887), after the local historian, literature of north-eastern counties of Scotland; Parker Soc. (Lond. 1840-55), after Archbishop Parker, the fathers and early writers of the Reformed English Church; Percy Soc. (Lond. 1840-52), after Thomas Percy, ballad poetry; Shakespeare Soc. (Lond. 1840-53); Soc. for the Publication of Oriental Texts (Lond. 1841-50); Elfric Soc. (Lond. 1842-56), Anglo-Saxon works; Chetham Soc. (Manchester, 1843), after Humphrey Chetham, works connected with Counties Palatine of Lancaster and Chester; Sydenham Soc. (Lond. 1843), medical literature; Spottiswoode Soc. (Edin. 1843-51), authors of the Episcopal Church of Scotland; Ray Soc. (Lond. 1844), natural history; Wernerian Club (Lond. 1844), scientific works; Cavendish Soc. (Lond. 1846), chemical science; Hakluyt Soc. (Lond. 1846), geography and travel; Arundel Soc. (Lond. 1848), important works of old masters; Early English Text Soc. (1864); Spenser Soc. (1867-68); Holbein Soc. (Lond. 1868), illustrated works; Ballad Soc. (Lond. 1868); Chaucer Soc. (1868); Harleian Soc. (1869), historical; English Dialect Soc. (1873); New Shakespeare Soc. (1873); Folklore Soc. (Lond. 1877); Index Soc. (1878); Wyclif (1882); Palaeographical and Pipe Roll Soc. (1883); Palestine Pilgrims Text Soc. (1884); Scottish Text Soc. (Edin. 1883); Scottish History Soc. (Edin. 1886). Among the many similar societies in the United States, the oldest is the Massachusetts Historical Society (Boston, 1792). See Burton, *Book Hunter*; Martin, *Bibliogr. Cat. of Books privately printed* (1834); Hume & Evans, *Learned Societies and Printing Clubs of the United Kingdom*; *English Catalogue* (Appendixes); Bohn, *Appendix to Lowndes' Bibliographer's Manual* (1864); *Yearbook of Learned and Scientific Societies* (1885; new ed. 1888).

Book-keeping is the art of recording commercial and financial transactions in a regular and systematic manner. Its object is to preserve a distinct and accurate record of such transactions, and from a well-kept set of books a merchant should be able to ascertain at any time the state of his account with any person with whom he has dealings, and the profits or losses resulting from each venture or department of his business, his assets and liabilities, and the exact state of his affairs. The stability of a business depends to a very large extent upon the accuracy of the information thus conveyed, for without it, the trader, in ignorance or with only a vague idea of his true position, often proceeds upon wholly erroneous and inflated ideas of his resources, and is only awakened to the real state of matters by the impossibility of meeting his liabilities when they fall due. Many a bankruptcy may be traced directly to the

errors and confusion arising from neglect or carelessness in this department. But these considerations are far from being universally realised and acted upon by business men. Among the class of small traders especially, the time required for keeping books in proper order is grudged as being unremunerative, and the work, if done at all, is performed in a careless and inefficient way, frequently with the disastrous results above referred to. The necessity of keeping proper books has been recognised by the legislature. The Debtors Act (Scotland), 1880, contains provisions for the punishment of bankrupts who have failed to keep satisfactory books, and the English Bankruptcy Act (1883) has a similar clause. A merchant's books frequently constitute important evidence in a court of law, and they should for this reason, if for no other, be kept as neatly and carefully as possible; the presence of blots, deletions, and erasures, or the tearing out of pages, will render them liable to suspicion, and greatly lessen their value in this respect.

It is probable that at a very early period, so soon as trading transactions became too involved to be readily borne in mind, means would be found to keep some record of them. Thus we read in the Book of Ecclesiastics (chap. xlii. 7), 'put all in writing that thou givest out or receivest in;' and excavations in Babylon have brought to light the records of a great banking-house inscribed upon the bricks or tiles which served the purpose of books. From certain passages in Cicero and Pliny it seems evident that the Romans understood something of *Debit* and *Credit*, so far, at least, as to make entries falling under these terms upon opposite pages. As an art, however, book-keeping appears to have arisen in the great mercantile cities of Italy during the 15th century, and the principles of double entry (*doppia scrittura*), under the name of 'the Italian method,' gradually spread over Europe, many languages still retaining the original Italian names as technical terms. The earliest treatise, so far as known, on the subject was contained in an algebraic work by a friar named Lucas de Burgo, which was published at Venice in 1494. The great work of Edward Thomas Jones, which is still the standard work on book-keeping, and is now in its 18th edition, was first published in 1795. Jones's *English System of Book-keeping*, as he called it, is in reality a simplified and methodised form of the Italian double entry, and his rules, with various modifications, are now almost universally followed. Blunders and confusion frequently arise from the attempt to follow slavishly definite rules without an intelligent knowledge of their meaning, a comprehension of the general principles being much more important than a strict adherence to any particular style however excellent. It may fairly be said that a just appreciation of the terms *Debtor* and *Creditor*, which, abbreviated to *Dr.* and *Cr.*, are usually placed at the top of the left and right hand respectively of every account, affords a master-key to the whole subject. A person, or his account, is regarded in book-keeping as *debtor* for what he *receives*, and *creditor* for what he *gives*. Thus the value of goods sold to a person, or cash paid to him, is placed to the *debtor* or left-hand side of his account, while cash or goods received from him are entered on the *credit* or right-hand side.

The details of book-keeping vary largely according to the nature and extent of the transactions which are to be recorded. Thus the shopkeeper's books differ from those of the great wholesale merchant, and these again from the books of banks, public companies, and government departments; but the same general principles underlie all, and

when once these are well mastered, they may, with the exercise of a little intelligence and ingenuity, be applied to every emergency.

There are two kinds of book-keeping in general use—SINGLE ENTRY and DOUBLE ENTRY. In the first of these, the only accounts kept in the ledger are those of the persons with whom there are dealings, and a statement of affairs is arrived at by adding together the debts due to the trader, and those due by him. To the former is added the value of any stock-in-trade or other property he may have, and the excess of these *assets*, as they are called, over the liabilities, is the amount of his *capital*. By comparing this figure with his capital at the last balancing date, and taking into account any sums he may have paid into or withdrawn from the business, he estimates his profit or loss for the period. But this is a manifestly crude and imperfect system, and most traders, even though they may not adopt double entry in its fullest and most elaborate form, import more or less of its principles in order to have some check upon the accuracy of their balance sheet and to gain information as to the details of their business.

Double entry is the true art of book-keeping, and it completely fulfils the requirements of clearness, completeness, and accuracy. Its theory is founded upon the obvious fact that every commercial transaction has two sides: if it is a *giving* by one person, it must be a *receiving* by another. Thus every sale involves a purchase, every debtor must have a corresponding creditor, and every creditor a debtor, and the double-entry system derives its name from recording both sides of each transaction. If an entry is made to the credit of any account in the ledger, there must be a corresponding entry to the debit of some other account. In this way the two sides of the ledger must always agree, or balance one another, and their failure to do so discloses the presence of an error—e.g. if a merchant buy a quantity of calico of the value of £50 from the manufacturers, A. B. & Co., he will place £50 to the *credit* of A. B. & Co.'s account, and the same sum to the *debit* of 'calico' account, which represents himself as the receiver. In the same way, if the calico is afterwards sold to C. D. & Co. for £60, that sum will be placed to the *debit* of C. D. & Co.'s account, and to the *credit* of 'calico' account. Many are deterred from adopting the double-entry system by an exaggerated idea of its complexity and laboriousness; and it would no doubt be most unwise for a tradesman with a small business to plunge into the most elaborate form of the system. But if his books are accurately kept by single entry it is possible to convert them yearly or periodically into double entry with very little trouble. This is done by casting up the purchases, sales, and expenses for the period, from which a goods account and profit and loss account can be constructed. Thus the principle of double entry is carried out, though roughly, and its check taken advantage of without multiplication of books, accounts, or labour.

The same books are used in both systems except the journal, which is peculiar to double entry, and a brief description of the most important books which would be kept by an ordinary merchant will serve to exemplify the general principles of book-keeping.

Day-book, or Sales-book.—This book contains a daily record of all goods sold. Under each day's date should be stated the name of the purchaser, and a full description of the goods—their quality, quantity, and the rate. If several items are sold to the same person on the same day, the various items are usually stated in an inner column, and the total amount extended to a second column.

for slovenliness or carelessness on the part of the book-keeper, or for want of due oversight on that of the employer. The utmost regularity, vigilance, and honesty are required to avoid snares and fallacies, and there are some errors which the most elaborate book-keeping will not detect, but in some cases, even help to conceal. Many a company, for example, has paid its shareholders a dividend out of apparent but delusive profits, resulting from over-valuation of property, or from reckoning bad debts as if they were good. Hence in taking stock, which should be done at least annually, great care must be exercised against over-valuation. In no case should stock be valued at more than its cost; if it has deteriorated, it should be entered at a correspondingly reduced figure. A deduction should also be made to cover depreciation in value of machinery, plant, and furniture, new additions being at the same time added.

Book-keeping is taught in our schools as one of the branches of a commercial education; but of no subject can it be said with greater truth, that a pinch of practice is worth a peck of theory. There are, however, several good books on the subject, and among them may be mentioned, besides the work of Jones already referred to, *Practical Book-keeping*, by F. H. Carter, C.A. (Edin.); and *Book-keeping by Single and Double Entry*, by William Inglis (Edin.), a convenient and reliable handbook on the subject. There are also several manuals of book-keeping specially suited to the requirements of the government Civil Service.

Book-lice, various small insects which damage books: (1) Thus in the family Psocidae, in the order Orthoptera, there are numerous minute wingless insects which shelter in books and among papers, and do especial damage to collections of insects. One of them (*Atropos pulsatorius*) was long credited with being the Death-watch. The closely allied *Troctes divinatorius* is a yet commoner pest of entomological cabinets. See DEATH WATCH.—(2) Among beetles, too, in the wood-boring family, Xylophaga, *Ptilinus pectinicornis* is known to attack books with wood in the binding. See the article BORERS.—(3) Very different are the book-scorpions (*Cheliferidae*) in the spider class (Arachnida). See BOOK-SCORPION.

Book of the Dead. See DEAD (BOOK OF THE).

Bookplates. This is the somewhat awkward English name for labels of ownership frequently placed on the inside covers of books. Abroad these labels are styled *ex libris*. The use of bookplates is of some antiquity, and mention has been made of one dated in the middle of the 15th century, but at present the fine bookplates of Bilibaldus Pirckheimer (1470-1530), designed by Albert Dürer, hold the foremost place in point of time. Engraved English bookplates are not found of so early a date, but an old folio volume from Henry VIII.'s library, now in the British Museum, contains an elaborately emblazoned drawing which formed the bookplate of Cardinal Wolsey, with his arms, supporters, and cardinal's hat. The earliest English engraved bookplate at present known is that of Sir Nicholas Bacon, father of Lord Chancellor Bacon, which is dated 1574. The number of English examples dated previous to the Restoration which have come down to us are singularly few, but after this period the series is well represented, and some of these plates are of considerable historical interest. Samuel Pepys had several bookplates; those with his own portrait could not have been engraved before 1685, because he is described therein as Secretary to the Admiralty under Charles II. and James II., but the one with his initials and the crossed anchors

was probably engraved as early as 1668. The bookplate of Pepys's faithful friend, William Hewer (in whose house at Clapham the diarist died), is dated 1699. The date on the plate of the well-known alderman and Lord Mayor, Sir Robert Clayton, is 1679. The names of Bishop Burnet, William Penn, Robert Harley, Matthew Prior, Lawrence Sterne, David Garrick, Horace Walpole, John Wilkes, and Charles James Fox, may be mentioned among those found on the highly prized bookplates of the collectors.

The styles of design adopted by book-collectors for their bookplates have been very diverse. Some of these labels have contained merely the name of the possessor, but the majority are armorial, some are allegorical in design, and others are ornamented with miniature landscapes. Many distinguished artists have condescended to produce bookplates. The name of Albert Dürer has already been mentioned as the designer of Pirckheimer's two plates—one in which the allegorical and the armorial elements are united, and the other consisting of a large and bold portrait of the once celebrated senator of Nuremberg. Of English engravers, William Marshall and Robert White may be specially mentioned. Hogarth engraved a bookplate for John Holland, heraldic artist, and another for George Lambert the scene-painter. George Vertue and Thomas Worlidge also produced bookplates, and Thomas Bewick was at one time fully employed in their production. One of the prettiest of bookplates is that designed by Agnes Berry in 1793 for the Hon. Mrs. Damer. This was engraved by Francis Legat. The earliest bookplates were of large size, as if made specially for folios, but a smaller size soon became general, a size which was used for both large and small books. Sir William Stirling Maxwell used a variety of sizes for differently sized books, and some of these bookplates were of gigantic proportions. The fashion of collecting bookplates is a very modern one, and not many years ago little attention was paid to them. A label of special interest might be retained in a book, but in most instances the bookplate of the latest owner was placed over that of the former one. The existence of these labels in books adds much to their interest, but the craze for collecting bookplates, apart from the books they once adorned, has little to be said in its favour. In 1837 the Rev. Daniel Parsons published an article on bookplates in the *Third Annual Report of the Oxford University Archaeological and Heraldic Society*, and in 1851 he announced his intention of writing a history of bookplates, but this work was never produced.

The Hon. J. Leicester Warren published in 1880 the first English work on the subject (*A Guide to the Study of Bookplates*), and in 1884 Mr. Griggs printed privately a very small edition of a work entitled *Eighty-three Examples of Armorial Bookplates*. See also, among others, the following works: Egerton Castle, *English Bookplates* (1893); Walter Hamilton, *French Bookplates* (1893); Poulet-Malassis, *Les Ex-libris Français* (2d ed. 1875); Dexter Allen, *American Bookplates* (1895); Vinycomb, *The Processes for the Production of Ex-libris* (1894); Sauler, *Art in Bookplates* (1895).

Book-scorpion (*Chelifer caneroides*), a small Arachnid, in appearance between scorpion and mite. It is like a small flattened scorpion without a tail. The front of the body is scorpion-like, and bears a transverse dorsal groove; the posterior body is flat, with 10 or 11 rings. There are two eyes; the respiration is by means of air-tubes; the eggs are

Book-scorpion.

carried about on the abdomen of the female. Spinning-glands are present, and the body is sometimes covered by the secretion. The size is about one-eighth of an inch, the colour brownish. The book-scorpion lurks among old books and papers, and probably helps their preservation by killing off and eating book-lice, mites, and other small insects. Upon the whole it likely does more good than harm. Other related forms are common under bark, moss, &c. Some species are found attached to the legs of house-flies, which not improbably indicates a partial parasitism. See ARACHNIDA, BOOK-LICE, SCORPION, SPIDER.

Book-trade. The business of dealing in books comprehends three classes of traders—Publishers, who prepare and dispose of books wholesale; Wholesale Booksellers, who distribute books to retail dealers; and Retail Booksellers, who sell books to the public. The latter class may again be divided into dealers in new books, in second-hand books, and in periodicals. Although ordinarily distinct, these classes may conveniently be treated together. While publishing apart from bookselling is of modern date, the selling of books is as old as the origin of literature. Manuscript copies of the works of authors were sold in the ancient Greek cities and in Rome. The first book of Martial's epigrams was to be had for an English equivalent of about three shillings; his other books for less. Slave labour was employed in transcription; and there were men who employed copyists and sold their work. Horace celebrates 'the brothers Sosii' as eminent booksellers (*bibliopole*). In the middle ages the monks of various monasteries were in the habit of bartering the books they transcribed. But books were rare and costly because of the ignorance and the apathy of the public. With the foundation of several universities in the 12th century, the preparation and sale of books increased; but the trade of bookselling attained to importance only after the invention of printing. The first booksellers were also book-lenders, under the control of the universities. In 1292 the book-trade of Paris consisted of 24 copyists, 17 bookbinders, 19 parchment makers, 13 illuminators, 8 dealers in manuscripts; the last had increased to 29 in 1323. The business was more in lending than selling. Students at the English universities bought their books or received them on loan from the 'svorn stationers.' Some of the French kings and princes of the royal blood were liberal patrons of authors and all engaged in the production of books. Philippe, Duke of Burgundy (1396-1467) gave constant employment at Bruges to a host of authors, translators, copyists, and illuminators.

The first printers acted also as booksellers, and being mostly learned men, they were generally the editors, and, in some instances, the authors of the works which they produced. The manufacture of books had become such an important item of commerce that at Bruges (1454) and Antwerp (1450) a guild of booksellers, copyists, and allied trades was formed (see PRINTING). Fust and Schöffer, the partners of Gutenberg (q.v.), carried the productions of the Mainz press to the fair of Frankfort-on-the-Maine and to Paris. Some instances of division of the two branches, printing and bookselling, occurred in the 15th century. The founder of the Stephens (q.v.) family of printers and publishers had settled in Paris in 1502; Louis, the first of the Elzevirs (q.v.), was settled as a bookseller and bookbinder in Leyden in 1580. The press established by Aldo Manuzio, during one hundred years (1490-1597), printed 908 different works (see ALDINE EDITIONS). Plantin (q.v. 1514-89) of Antwerp had sometimes twenty presses at work.

Migrating from place to place, and resorting to the great continental fairs for customers, the early booksellers became known as *stationarii*, or stationers—i.e. occupiers of a 'stance' or station at a fair. The first stationers in England seem also to have engrossed what they sold. Caxton and Wynkyn de Worde chiefly issued translations. The Reformation caused a great demand for Bibles. The pedlars who frequented the country fairs were of some importance in the early days of bookselling. It was a common thing for government, in the 16th century, to enforce the printing of restrictions as to price on the last page of a book. The number of readers was but small, and in 1540 Grafton printed only 500 copies of his complete edition of Scripture. There exist 326 editions of the Bible or parts of the Bible printed between 1526 and 1600. Ames and Herbert record 350 printers at work in England and Scotland (1476-1600); at least 10,000 distinct works were printed during that period. The British Museum has a collection of over 2000 volumes of Tracts all relating to the period of the first English Revolution from 1640 to 1660, which include 30,000 separate publications. This was the era of the controversial pamphlet. Dr Johnson has remarked that from 1623 to 1664 the nation was satisfied with two editions of Shakespeare. The stock of books in sheets lost by the booksellers around St Paul's in the great fire of 1666 was of an estimated value of £200,000.

Whether settled or migratory, the early booksellers were subject to many restrictions. In England, the book-trade was trammelled by royal patents and proclamations, decrees and ordinances of the Star Chamber, licenses of universities, and charters granting monopolies in the sale of particular classes of works. In 1557 the Stationers' Company of London was constituted by royal charter, and exercised an arbitrary censorship of the press. The Crown, by an Act 13 and 14 Car. II. chap. 23, commonly called the 'Licensing Act,' assumed this species of control over the issue of books. The Licensing Act, and its renewals, ultimately expired in 1694. By the first Copyright Act, 8 Anne, chap. 19, the legislature interposed to protect the rights of authors, and to relieve them, as well as publishers, from the thralldom of the Stationers' Company. But by the same act, the Archbishop of Canterbury, the Lord Chancellor, and certain judges in England, and the judges of the Court of Session in Scotland, were empowered, on the complaint of any person, to regulate the prices of books, and to fine those who sought higher prices than they enjoined. This provision was in force till 1738, when it was abolished by the Act 12 Geo. II. chap. 36. From this time the book-trade was free.

Many of the bibliopoles who flourished in the 17th and 18th centuries have been rendered famous, not less by their enterprise and vigour of mind, than by association with the authors and wits of the period. Thomas Goy (1644-1724) is remembered in connection with the Bible-trade, and as the founder of Guy's Hospital; Cripps, the publisher of the seven folio editions of Burton's *Anatomy of Melancholy* (1621-76), according to Wood, 'got an estate by it;' John Dunton's (1659-1733) name has been preserved by Swift, and he is notable as one of the first men the Pretender purposed to hang at Tyburn, if ever he ascended the British throne, 'for having writ forty books to prove him a Popish impostor;' Jacob Tonson (1656-1736), Dryden's publisher, and satirised by the poet, was the first to popularise *Paradise Lost* and Shakespeare; Lintott (1675-1736) enriched himself and Pope with editions of the *Iliad* and *Odyssey*; Curll (1675-1748) was pilloried not only by the govern-

ment, but by Pope in his *Dunciad*; Richardson (1689-1761) was both novelist and printer; Johnson, who wrote the life of Cave (1691-1754), said Cave 'scarcely ever looked out of the window but with a view to the improvement of his *Gentleman's Magazine*.' Of the publisher of Thomson, Fielding, and Hume, he also said, 'I respect Millar, he has raised the price of literature.' One of the Newberys, bookseller and medicine vendor, was associated with Goldsmith, and is spoken of in the *Vicar of Wakefield* as 'the philanthropic bookseller of St Paul's Churchyard.' Ralph Griffiths is notable as the founder of the *Monthly Review* in 1749, and Dodsley of the *Annual Register* (1758). Joseph Cottle (1770-1853), the Bristol bookseller, was the friend and early patron of Coleridge, Southey, and Wordsworth. The names of Hutton, Cadell, Strahan, Baldwin, Rivington, Longman, Dilly, Lackington, were no less notable in their day, than have been, in later times, those of Knight, of Edward Moxon, the friend of Lamb, and publisher of the early works of Browning and Tennyson, and of Bell & Sons, Bentley, Cassell, Chapman & Hall, Chatto & Windus, Longman, Low, Macmillan, Murray, Nisbet, Rivington, Routledge, Seeley, and Smith, Elder, & Co.

In Scotland, after struggling through an age of restriction, the book-trade was developed about the middle of the 18th century. In Edinburgh, it engaged Allan Ramsay, who published and sold his songs and his charming pastoral. Among his successors were Donaldson, Bell, Miller, Elliot, and Creech (author, and publisher of the first edition of Burns), each eminent in his way; but it was mainly Archibald Constable (q.v.), the first publisher of the *Edinburgh Review* and *Waverley Novels*, and later William Blackwood (q.v.), the originator of *Blackwood's Magazine*, who raised the reputation of Edinburgh as a literary mart in the early part of the 19th century. Still more recently the reputation of the Edinburgh book-trade has been maintained by W. & R. Chambers; by Adam Black (q.v.), publisher of the *Encyclopædia Britannica*, whose house removed to London in 1892; by T. Nelson & Sons, well known for their educational, juvenile, and religious publications; by W. & A. K. Johnston, publishers of maps and atlases; and by Mr Bartholomew, geographical publisher. The preparation of school-books has largely occupied the energies of the two principal publishing firms, while it is worthy of note that two of the most successful encyclopædias of the 19th century, the *Britannica* and the present work, emanated from Edinburgh. Glasgow during recent years has become energetic in publishing, and many books, chiefly educational, have been issued from local presses.

The purchase of books in the 15th and 16th centuries was confined to the nobler and richer citizens and scholars. In the 17th and 18th centuries the demand for books began to spread among the middle classes. The plan of issuing neat cheap editions of popular works was initiated more than a hundred years ago (1760-70) by Alexander Donaldson (an Edinburgh bookseller), and by John Bell, who in 1777 issued *British Poets, from Chaucer to Churchill*, which led to the famous meeting of forty members of the London book-trade in the Chapter Coffee-house, and to the publication of Johnson's *Lives of the Poets*. These were followed up by several publishers in London, one of whom, C. Cooke (1790-1800), issued an extensive series of cheap reprints, of a pocket size, called *Cooke's Editions*, which for tastefulness of preparation have hardly been excelled. In the early years of the present century, Suttaby's, Sharpe's, Walker's, and Dove's pocket editions were stock articles in the trade. About 1817-18 some enterprising booksellers began to break through certain old usages,

by issuing reprints of standard works, in a good style of typography, at considerably reduced prices. At the same time, numerous cheap periodicals made their appearance; but these, for the most part, were of so seditious, irreligious, and libellous a character, that the law interposed to check the growing evil, by the Act of 1819 (see *NEWSPAPERS*). During the next ten years the only periodical that attained to permanent success was Limbird's *Mirror* (1822), an illustrated weekly sheet. In 1827 the Society for Diffusing Useful Knowledge began to issue its low-priced scientific treatises; and Archibald Constable commenced the cheap series of works in original literature, called *Constable's Miscellany*. 'Though Constable in his grand style,' says Knight, 'talked of millions of buyers, he charged his little volumes 3s. 6d. each. He was right. The millions were not ready to buy such books at a shilling, nor even at sixpence. They are not ready now' (1854). All this is changed, and as good value can now be had for sixpence and a shilling.

Viewing all previous enterprises of this kind as fitful and insufficient, as well as unsupported by any breadth of appreciation, we have to refer to this period (1827-32) for the true origin of what is now designated the 'cheap press.' Taking advantage of the growing demand for cheap literature, and desirous of guiding it in a right direction, William and Robert Chambers (q.v.) of Edinburgh began, on the 4th of February 1832, to issue *Chambers's Edinburgh Journal*, a weekly sheet at 1½d.: on the 31st of March following appeared in London the *Penny Magazine* of the Society for the Diffusion of Useful Knowledge; and this was followed, July 7, by the *Saturday Magazine*, which was issued under the direction of a committee of the Society for Promoting Christian Knowledge. The success of *Chambers's Journal* led to the issue of *Information for the People*, *Cyclopædia of English Literature*, *Miscellany of Tracts*, and many educational and other works. Charles Knight (q.v.), first editor of the *Penny Magazine*, with his *Penny Encyclopædia*, and *Library of Entertaining Knowledge*, and other works, was another pioneer of the cheap press. Within twenty years he expended £80,000 upon copyrights and literary labour, and during the same period £50,000 upon paper-duty. The effect of the repeal of the advertisement-duty (1853) and of the paper-duty (1861) was to encourage the production of cheap literature. John Cassell's (q.v.) name survives in the largest book-factory of modern times, along with his *Popular Educator*, *Family Bible*, and innumerable other works; Routledge's *Railway Library* and *Popular Library* of cheap novels, and shilling and sixpenny editions of standard works, are well known. Bohn's Libraries are familiar to scholars and lovers of good literature all the world over. The Longmans, honourably connected with the London book-trade for more than a century and a half; Strahan, originator of *Good Words* (1860) and *Contemporary Review* (1866); Smith, Elder, & Co., proprietors of the *Cornhill* (1860), and publishers of Thackeray and Browning's works; Macmillan & Co., publishers of Lord Tennyson's works, and those of men eminent in all departments of science and literature; along with many others, have all added their quota to the rapidly increasing volume of cheap literature.

At present, we have the works of Shakespeare at sixpence and one shilling, and penny reprints of some classics. Well printed threepenny editions of standard books, and portions of books, began to be issued in 1886. For many years previously the *Bibliothèque Nationale* in France, and the *Universal-bibliothek* in Germany, had supplied the public on the Continent with standard literature at the same figure. The good, well

printed volumes of standard literature now to be had at sixpence and one shilling must make literary rubbish less saleable. There is now less reason for Mr Ruskin's reproof than ever, that 'we call ourselves a rich nation, and we are filthy and foolish enough to thumb each other's books out of circulating libraries. . . . How much do you think we spend altogether on our libraries, public and private, as compared with what we spend on our horses?' The trade in light literature, and in cheap periodicals and newspapers, has been fostered by the railway bookstalls, of which Messrs W. H. Smith & Son had 600 in 1888. The 'shilling dreadful' had a phenomenal sale during 1885-88. Such books as R. L. Stevenson's *Treasure Island* and H. Rider Haggard's *King Solomon's Mines* revived the taste for tales of adventure. A London publisher (Routledge) reported in 1885 that in round numbers he printed 6,000,000 books annually, of which 4,000,000 were bound, being at the rate of about 14,000 books per day. One reason of the cheapness of good books is the expiry of copyrights; in the case of such popular authors as Scott, Dickens, Thackeray, and Carlyle, it has led to many competing editions, some of them at a very cheap price. Advertisers seizing the idea have even issued penny editions of some of the most popular works by popular authors.

The present generation, which has witnessed a great reduction in the price of books, has also had the privilege of purchasing the most luxurious and artistic *éditions de luxe*, frequently printed from type specially cast for the purpose, the illustrations in the highest style of art, and printed on china-paper. Shakespeare, Thackeray, Dickens, and isolated volumes, such as George Eliot's *Romola*, and Blackmore's *Lorna Doone*, have been treated in this magnificent manner. The price for such books, of which only a limited number is printed, runs from one to four guineas. To get up a book in this way necessitates the expenditure of many thousands of pounds. We hear of the plant of an *Illustrated Shakespeare* costing £10,000, and an illustrated book of *Natural History*, £16,000. The trade in the manufacture of children's picture-books has assumed great dimensions; those by Caldecott (q.v.) having been eminently successful. The best talent in literary and artistic circles has been employed in the production of books for the young. The bright and attractive books and periodicals for juveniles are often the envy of older minds. There are fashions in books, as in ladies' dresses, and the sale and use of Birthday Books (q.v.) led to an enormous business being done. The great improvements in Bookbinding (q.v.), including artistic covers, abundance of illustrations (many of which are electrotypes purchased and adapted) in Christmas books, or books for presents, has given a stimulus to certain branches of the trade. The great bookselling season is from October to February, when the nights are long; during the summer, fiction and the lighter periodicals sell best. For the last three months of the year the wholesale booksellers have a hard time of it, executing orders for the various annual volumes of the periodicals, and Christmas literature of every kind. The practice which Dickens inaugurated of issuing Christmas numbers has grown enormously, and has been adopted with profit by many leading illustrated newspapers and periodicals. Good newspaper notices sometimes start the sale of a book; when it has begun to sell, if really good, its success proves its best advertisement. When a book has been issued at one guinea, or two guineas, after the richer public has been exhausted, a moderately cheap edition may be brought out at a price from 5s. to 10s. 6d., followed up at a proper interval, if the book is calculated for wide circulation, by an

edition at 2s. 6d., or even less. The following were some of the best selling English books in 1887, in the order of popularity, from a London retail book-seller's point of view: The works of Shakespeare, Tennyson, Longfellow, Byron, Milton, Scott, Hood, Dickens, Thackeray, Besant, Mrs Henry Wood, Mrs Craik (*John Halifax*), George Elliot, Lord Lytton, R. D. Blackmore, Mark Twain, Macaulay, R. L. Stevenson, Miss Braddon, &c.

The position of those who, in the hurry of business life, and in the time occupied in earning a living, have little leisure for solid reading, has been abundantly catered for in the 'story' paper, and the lighter periodicals. Convenient abridgments, manuals, compendiums, and primers of almost every branch of knowledge exist; while many publishers have made quite a feature of 'condensed' lives of celebrities. See BIOGRAPHY.

The circulation of our weekly and monthly periodical literature is enormous, and can only be calculated by millions of copies. At the end of 1831 there were issued 177 monthly publications; in 1833 there were 236; in 1853, 362; and in 1893, 2060; more than 470 of the latter were of a religious character.

As circulating libraries, by creating a taste for reading, led to the establishment of the cheap press, so, as might be expected, has the cheap press extended the sphere of literature, and given rise to public libraries and book-clubs. C. E. Mudie in 1842 introduced a new system of subscription lending library, and since then the firm have purchased some seven million volumes for the use of subscribers; the number of volumes issued and re-issued daily during the busy season now exceeds 5000 volumes. About 250 persons are employed, and now there are over 40,000 subscribers. As many as three thousand copies of a single work at eighteen shillings or a guinea are sometimes added; so that in many cases what would formerly have been considered to be large editions are absorbed by one purchaser. After being used for several months, the surplus copies are sold at a cheap rate. It is not unusual for the catalogue to exceed 300 pages. For country subscribers some 700 boxes of varying size are sent out every day. The London Library and the Grosvenor Library are also well known. Messrs Smith's remarkable system of bookstall libraries was begun in 1858.

The selling of second-hand books from open stalls, and from Booths (q.v.), is a practice so ancient as to be connected with the trade of the stationarii of the middle ages. Some men of considerable note in the book-trade began in the humble quality of stall-keepers. London is the chief seat of the second-hand book-trade; but it is also conducted on a respectable scale in Edinburgh, Glasgow, Manchester, Liverpool, Oxford, Cambridge, Dublin, Bristol, and other centres of wealth and intelligence. In many cases what are called 'remainders' of an edition are purchased and sold at a merely nominal price by the second-hand booksellers. But the dealers procure supplies chiefly at public auctions of the libraries of deceased clergymen, professors, and private gentlemen, of which sales there is a constant succession in London, Edinburgh, and elsewhere. At these auctions, good editions of standard books may usually be obtained at moderate prices; but rare and curious works, prized by the 'bibliomaniac,' frequently bring very high sums. Mr Quaritch spent £40,000 at the Hamilton sale, and £33,000 at the Sunderland sale. He paid £3900 for the Mazarin Bible, and £4950 for the *Psalterium Codex* (1459), a portion of the Scriptures. A vellum copy of the Gutenberg and Fust Bible sold for £3400, a paper copy for £2690. See BIBLIOMANIA. Dealers in second-hand books send catalogues to their

customers throughout the country; and from this source not a few gentlemen's libraries are mainly made up. Large quantities of second-hand high-class works are purchased for public libraries forming in the United States. From France, Italy, and Germany, there has been a similar export-trade in fine old editions to North America. In 1888 was published a new edition of *The Directory of Second-hand Booksellers* in Great Britain, on the Continent, and in America.

The *Canvassing-trade* consists in the plan of disposing of books mostly in weekly and monthly numbers or parts by house-to-house visitation. Smollett's *History of England*, Stackhouse's *History of the Bible*, and Scott's *Bible* are early examples of successful publication in number form. Amongst modern authors, Thackeray, Dickens, and George Eliot tried the part form of publication with success. There are also various societies in this country employing book-hawkers or colporteurs, who visit outlying districts which are not reached by the ordinary bookseller.

Apart from the general trade, the publication of small books, tracts, and periodicals is carried on to a large extent also by associations for religious purposes, the funds for which are raised by voluntary subscription. See the article TRACT SOCIETY.

Another distinct kind of trade is that of printing and publishing authorised versions of the Bible, New Testament, and Book of Common Prayer. The preparation of these works has always been a prerogative of the crown, which grants exclusive privileges or patent rights to certain parties for the purpose. According to old usage, England, Ireland, and Scotland are treated separately. The last patent for England was granted by George IV. to Andrew Strahan, George Eyre, and Andrew Spottiswoode, for a term of thirty years; and having commenced on the 21st of January 1830, it expired on the 21st January 1860, and was then renewed during pleasure. The universities of Oxford and Cambridge have, by royal charters, enjoyed the right of printing Bibles, &c. in common with the patentees; but as the Queen's printers represent the owners of the copyright, the privilege of prosecution for infringement belongs to them alone. In the case of the revised version of the Bible, issued in 1881 and 1885, the university authorities purchased the copyright from the revisers, and consequently have the sole right of publication; over one million copies of the New Testament were sold (by the Oxford Press alone) on the first day of its appearance. See PATENT.

In Ireland, George III. in 1766 granted a Bible patent to Boulton Grierson for forty years. He was succeeded by his son, George Grierson, who in 1811 obtained a renewal. Trinity College, Dublin, had also a concurrent right. In Scotland, the last patent expired in 1839, and was not renewed. The crown appoints a Board with authority to grant licenses to parties desirous to print editions of the Bible and other books falling within the royal prerogative, such as the Confession of Faith.

The modification of the patent having tended to lower prices, the possibility of any further material reduction seems doubtful. One noticeable feature of the trade in Bibles is, that the publishers in England sell large numbers in sheets to the various religious societies, such as the British and Foreign Bible Society and the Society for Promoting Christian Knowledge, who issue editions to the public under cost price—the New Testament from one penny, and the complete Bible from sixpence per copy. The better bindings, in morocco or ornamental styles, are retailed at proportionately higher prices. In London alone, probably more than 2000 persons are employed in binding Bibles, prayer-

books, and other books of devotion; but the tendency now is for the publishers or printers to do their own binding. From their cheapness, but more particularly from their accuracy, English-printed Bibles and New Testaments are purchased in large quantities by the United States. The Oxford University Press now carries on the whole process of Bible production within its own premises.

Although the printing of the authorised version of the Bible, the New Testament, and the Book of Common Prayer, seems to be reserved to the nominees of the crown, practically no objection is taken to the printing of these works by others. Translations of the Bible, other than the authorised version, are also issued freely by Roman Catholic and other bodies.

The universities of Oxford and Cambridge; the four Scotch universities; and the colleges of Eton, Westminster, and Winchester, obtained an act of parliament, 15 Geo. III. chap. 53, giving them a perpetual copyright of all works belonging to them, or which might afterwards be bequeathed to or given to them, provided such works are printed at the university or college presses. The only work in existence older than the present century, claimed by any of the above institutions, to which any value can be attached, is Clarendon's *History of the Rebellion*, with his life and continuation. The right to this and other works possessed by the university of Oxford, was confirmed by the Copyright Act (5 and 6 Vict. chap. 45). The profits of the first edition were applied towards the erection of the 'Clarendon Building' (1713), which till 1830 was the university press; but, its business increasing, the 'Clarendon' has been superseded by the 'University Press.'

The British book-trade is centred in London, though carried on to a considerable extent in Edinburgh, and to a less degree in Oxford, Cambridge, Liverpool, Manchester, Dublin, Glasgow, and a few other places. The London Post-office Directory alone contains the names of over eight hundred persons who were connected with the book-trade. Among these booksellers are included commission-houses; and among the publishing establishments are branches from Scotland, America, and several English provincial cities. The London book-trade is partly carried on in distinct departments: miscellaneous literature, law books, medical books, educational treatises, periodicals, &c., respectively engage the attention of publishers; and as regards religious books, each sect may be said to have publishers and booksellers of its own. The larger number of the publishing and commission houses are situated in Paternoster Row and the streets adjoining; so that this part of the city has become the great and acknowledged market for literature. Covent Garden and Fleet Street are likewise centres of the business. Between the country booksellers and the leading publishers and commission-houses a continual correspondence is kept up. In addition to his daily or weekly parcel every provincial bookseller makes up a monthly order for magazines, periodicals, and books.

In the infancy of the trade, authors frequently resorted to the plan of getting friends and patrons to subscribe for copies of their forthcoming works; the publisher in such cases acting only as commission-agent. Literature has now risen above this degrading system. At present, (1) the author sells his work in manuscript to the publisher for a specified sum, giving him an assignment of the copyright, and leaving him to bring out the work according to his own taste; or (2) the author retains the copyright, pays all expenses, undertakes all risks, and gets a publisher to bring out his work; or (3) the author, retaining the copyright,

incurs no risk, and only allows the publisher to print and issue an edition of a certain number of copies for a sum agreed on; or (4) the author and publisher issue the work at their joint risk, in that case sharing equally in profit or loss, or on such other terms as are mutually agreeable; or (5) the publisher agrees to issue the works of a popular author at his own risk and expense; the clear profits are divided into three equal shares, one of which is paid to the author, and two retained by the publisher, or the author may receive half-profits, which, in the case of a 5s. book, may amount to 9d. or 1s. a copy; or (6) the familiar 'royalty' system, by which the publisher takes whole or partial risk and pays the author a certain sum per copy, after the disposal of a specified number of copies. Under the French system the publisher takes the book, and makes what he can of it, but pays the author a royalty. A successful author on a book nominally priced 3.50 francs receives a royalty of about 5d. per copy, but a very successful author may command as much as 10d. Under the French law the printer is forbidden to print copies except by order of the author.

Publishing is an exceedingly hazardous profession, and those engaging in it must possess wide and special knowledge, else they may soon lock up their capital unprofitably, and fill their warehouses with waste-paper. This is especially the case in dealing with literature which is sold at a very small advance upon the actual cost of paper, print, and binding. Attached to the larger publishing houses are men who read and give judgment on the manuscripts submitted to their care, when this is not undertaken by the head of the firm. Works of which the highest expectations are formed may not pay expenses; and books of a seemingly worthless kind may prove exceedingly remunerative. Mr Ruskin has objected on principle to the booksellers' system of discounts and abatements: after 1873 he severed his connection with his former publishers, and appointed an agent of his own, who has issued new editions of most of his writings. Mr Ruskin, however, had to relax this rule of selling at a fixed price, and allow the booksellers a discount of 10 per cent. An 'Incorporated Society of Authors' was founded to watch over the interests of authors, and to support the Copyright Association (composed of publishers and authors) in furthering the establishment of the International Copyright Union.

Milton's agreement with Simmons the printer, disposing of the copyright of *Paradise Lost* for five pounds, is an oft-quoted but inadmissible argument against publishers, as a larger sum was paid, and at that time it might even have been a losing bargain. It would be easy to cite many publishers' blunders, in at first refusing works which, when issued, have taken their place amongst the classics of literature. Publishers as a rule are high-minded, fair, though keen men of business, and it is quite to their advantage to treat an author well. There have been cases of gross injustice, but when an author's books find a ready market, he reaps a ready benefit. If we take the line of fiction, in which Great Britain is said to have an average of two books a day, Sundays included, we find many instances of large sales and large earnings. Scott's income from his pen ranged from £10,000 to £15,000 per annum for many years. He is said to have received £110,000 for 11 novels and 9 volumes of tales. *Woodstock* alone yielded him £8228, and his *Life of Bonaparte* (2 editions), £18,000. Thackeray, when he became famous, was well paid for every line he wrote, and received a handsome salary for editing the *Cornhill*. For several novels Trollope and Dickens each received more than £3000, while the bargain for *Edwin*

Drood was £7500 with a share in after profits. Routledge paid Lord Lytton £20,000 for the right to publish a cheap edition of his novels for ten years. 'George Eliot' (Marian Evans) was paid £40,000 cash down for the first sales of her various books; for *Felix Holt* she was paid £5000; *Romola*, £7000; and *Middlemarch*, £8000. Macaulay received a cheque for £20,000, being his share of the profits of two volumes of his *History*. Browning received 100 guineas for his ballad 'Hervé Riel' in the *Cornhill*. These may be thought exceptional payments, but the rule holds good that where an author finds a large public, he secures a willing publisher and large payments. But not many books have a sale like the *Pickwick Papers*, 900,000 copies of the authorised edition having been disposed of by Chapman & Hall up till 1887.

In publishing new books, the copyright, setting up the types, author's corrections, stereotyping, press-work or printing, paper, binding, advertising, and presentation copies to editors for review, all need to be taken into account. When the author retains the copyright, the publisher charges, besides the above items for printing, &c., a commission on the sales of the work. Editions of a book are frequently wanted for an export order, or sets of stereotype plates are purchased by publishers in the United States or Canada, in order to print from. New books are issued at a certain selling price to the public, and the publisher allows a percentage off the price to the retail bookseller. In a large proportion of cases, there is interposed the commission-agent or wholesale dealer. A new book on the eve of publication is offered to the trade at a slightly cheaper rate than at a later date. At the trade sales, which are now less common than formerly, some publishers do a large business.

Throughout the more respectable part of the trade there is a constant effort to maintain unbroken prices; for when a book can be obtained by booksellers below trade-price, it is essentially ruined for all regular business. On the other hand, the practice has become very general among retail booksellers of selling new books to the public at prices little above cost. This system of underselling has caused much disquietude in the trade. Mr Sampson Low was secretary of a trade association (abolished 1852), which had for its object the protection of the bookseller against underselling. For a long time resolute attempts were made by the heads of the profession to refuse to deal with undersellers; but these, appealing to the public, ultimately conquered; and now books of all kinds are disposed of at such prices as the bookseller pleases. After making all ordinary deductions, to which losses, &c. may be added, publishers can reckon on receiving little more than half the price at which their books are nominally issued. Many publishers annually spend very large sums in advertising new books.

Publishers are under the legal obligation to deliver, free, a copy of every book they issue (new editions without alterations excepted) to the five following public institutions: Library of the British Museum; Bodleian Library, Oxford; University Library, Cambridge; Trinity College Library, Dublin; and the Library of the Faculty of Advocates, Edinburgh. Lord James and Sir Richard Webster gave in 1887 a decided opinion that copies of every American book issued in Great Britain, though printed and originally published in America, must also be sent to the British Museum. Manufactured American books are imported in large quantities by British publishers, who, for the convenience of purchasers, print on the title-page the name of the firm which has introduced the work into Great Britain; hence the claim of copies by the British Museum. There is

no compulsion as to registration of titles at Stationers' Hall, the fee for which is 5s. (see COPYRIGHT). The title of a popular book or periodical is often of great value, and is jealously guarded by the publisher; the use of this title by another is an infringement of copyright. Owing to the rapid multiplication of books, it is becoming increasingly difficult to steer clear of titles already in use. In 1893-94, 12,759 volumes were lodged at the British Museum in terms of the Copyright Act, and 511 by international exchange, 19,084 acquired by purchase, besides 4944 pieces of music, and about 2500 sets of newspapers. See BRITISH MUSEUM.

The gradual increase in magnitude of the book-trade is interesting. One of the first catalogues compiled in England (1666-80) has a list of 3550 works, being a yearly average of 253. From 1700 to 1756, without including pamphlets, 5280 new books were issued. The *Modern Catalogue of Books* (1792-1802) has a list of 4096 new works, or an annual average of 372 new books. According to the *London Catalogue* of 1800-27, the publications, including reprints, amounted to 19,860 volumes; that of 1816-51 contains the titles of 45,072 books, an average annual publication of more than 1200 books. There were three times as many books published in 1853 as there had been in 1828. The annual production of new books in the period 1877-87 averaged 4000 volumes; of new editions, 1400. The number of new books issued during 1893 was 5129; the new editions, 1253. Of this number 1328 were novels and tales; 533 theology, sermons, &c., and 622 educational. Owing to the absence of compulsory registration, however, statistics respecting the publishing trade of Great Britain cannot be wholly accurate. The only statistics now issued are those associated with the compilation of Low's *English Catalogue*. In 1893 the books imported into the United Kingdom were valued at £249,277. Of these, the value from Germany was £19,236; France, £47,955; Holland, £101,921; Belgium, £16,794; the United States, £51,629; other countries, £5160. The value of English printed books exported in 1893 was £1,261,921. The United States purchased to the amount of £392,219; Australasia, £438,595 (the returns for 1885 showed an average annual expenditure in Australia of more than 11s. per head in books and stationery); Canada, £83,259; British India, £133,508. France, Germany, Holland, and Belgium unitedly took to the value of £106,526; our next largest customer being South Africa, for £99,682. The total to British possessions was £714,423; to foreign countries, £547,498.

In Germany, where the book-trade first became established, the principal mart was Frankfort, to whose fairs the early booksellers and printers resorted. Leipzig also became a great mart for books as early as 1680; but in 1885 as many books were published in Berlin as in Leipzig; and since about 1830 Stuttgart has come to the front, whilst Frankfort has entirely lost its ancient prestige. From the teeming press of Baron Bernhard Tauchnitz of Leipzig there had been issued by 1888, by arrangement with British and American authors and publishers, a series of more than 2000 volumes of cheap reprints of English popular works in a pocket size. The bringing of these German reprints of English copyright works into Great Britain is against the law, and copies are liable to seizure. From a table prepared by Hinrichs of Leipzig, we learn that 16,253 books were issued in Germany in 1886, and 21,275 in 1891. Of this number, educational and theological works topped the list. Book-buyers in Germany have the privilege of receiving books on approbation from the booksellers and publishers: in this way an examination can be made of the proposed purchase, which may be returned.

Though Germany has the largest number of new books of any country in Europe, editions are relatively small; and the encouragement to men of letters is poor. Great use is made of the circulating library, upon which the publisher mainly depends for the sale of a popular work. Some of the illustrated papers have an enormous circulation. *Die Gartenlaube* has a circulation of 300,000; *Über Land und Meer* has 150,000.

In France, every book and pamphlet must be registered before publication, and publishing is carried on chiefly in Paris, where there are many extensive printing establishments. About two-thirds of all the books published issue from Paris. A large number of the scientific works are published at the sole cost of the state. French books are, with few exceptions, done up simply in coloured paper covers, for temporary service; works of a superior class are executed with a high degree of taste—the excellence of pictorial embellishments being always conspicuous. The finest *éditions de luxe* used to be French; and many expensive works in French, and also in the classical languages, issued from the Parisian press still command a large sale. Owing to the almost universal knowledge of the French tongue, there is a large export to foreign countries.

Belgium possesses a flourishing book-trade; and Brussels, as a kind of minor Paris, is the seat of some extensive printing and publishing concerns. In Italy there are recent signs of revival in book-publishing and bookselling. The trade of the other European countries is of less interest.

The book-trade of the United States has sprung up from small beginnings within the present century. Hezekiah Usher was in business in Boston in 1652; bookselling was well established at the beginning of the 18th century. Benjamin Franklin (q.v.) was one of the most famous of the early printers. But at first scholars and libraries were mainly supplied with books from Europe, and the bulk of American publications were reprints of British literature. In the period 1830-42 about 1300 books were issued, half of them being original, and half reprints; in 1853 there were 879; in 1855, 1092; in 1859-60, 1350 a year; and in 1871, 3000. The *Publishers' Weekly* recorded the publication of 4665 new books and new editions in 1891, and 4862 in 1892. The number of new books entered for copyright in 1878 was 5632, and in 1879, 6580; and it is estimated that, of the 10,212 articles in the form of books entered in 1887, about three-fourths may be reckoned as properly coming under that designation. There are nearly 350 firms in the United States which publish books. Of these New York has 130; Boston, 38; Chicago, 35; and Philadelphia, 34. The great distributing houses are located at New York, Philadelphia, and Chicago; Caspar's *General Directory of the American Book, News, and Stationery Trades* (1888), wholesale and retail, contains the addresses of 20,000 firms actually in business. A few of the larger publishing houses, such as Harper's in New York, and Lippincott's in Philadelphia, print, bind, and manufacture the books they sell. The latter firm combines the business of the publisher, 'jobber,' or middleman who buys from the publisher to sell again, and retailer. The names of Appleton, Roberts Brothers, Ticknor & Co., Houghton, Mifflin & Co., Scribner, and others, are well known. A very large proportion of the book business is done by book-agents or canvassers. At the fall and spring trade sales, a large business is done, both in new publications and in older standard works, at a discount of from 25 to 40 per cent. off the usual trade prices. Local booksellers have suffered through the commission-agents and library associations who deal directly with publishers.

Between 1820 and 1856 a very large proportion

of American books were reprints of English works. But as Holmes expresses it, 'the Yankee mind, which has for the most part bided and flowered in pots of English earth,' has now asserted its own individuality, and produced writers of genius and culture, and of world-wide reputation, such as Irving, Hawthorne, Motley, Holmes, Prescott, Emerson, Longfellow, Whittier, Poe, and Lowell, whose works have lent dignity and importance to American literature, and given an impulse to the book-trade. Mrs Stowe's *Uncle Tom's Cabin* had a phenomenal sale, 500,000 copies being sold in less than five years in the United States, and by April 1852 more than 1,000,000 had been reprinted in Great Britain. Of Longfellow's poems, without taking into account unauthorised English reprints, the American sales in 1839-57 amounted to 325,550 copies; from the latter date till 1881, 194,000. Webster's *Spelling Book* (Appleton & Co.) had reached a sale of 50,000,000 copies in 1887, and is said still to sell at the rate of about 1,000,000 copies a year. In spite of the ruinous competition with unpaid English literature, a popular American author commands a high figure for his work. C. L. Webster & Co. are said to have paid Mrs Grant £40,000 as her share of the profits of vol. i. of *General Grant's Life*, probably the highest payment for a single volume on record. Louisa M. Alcott is reported to have received £20,000 for her *Little Women* series. Bonner of the *Ledger* paid Henry Ward Beecher £6000 for his *Norwood*, and £1000 to Dickens for one short story. The Harpers gave Longfellow £200 for his 'Keramos' for *Harper's Magazine*, and the same figure for 'Morituri Salutaumus.' T. B. Aldrich once received £240 for a short story, and W. D. Howells and Mark Twain (Samuel L. Clemens) can command £100 or £200 for a short story or article.

A common arrangement between the American author and publisher is a payment of 10 per cent. royalty on the retail price of all sales; sometimes a lump sum is paid, and the publisher secures the copyright, which is granted for twenty-eight years, subject to renewal by the author, his widow, or children for other fourteen years. A condition is that a copy of a title-page must be registered with the librarian of congress, and two copies of the best edition of the book lodged there within ten days of publication. The entry fees are 50 cents, and 50 cents additional for a certificate of record. A copy of any new edition must also be sent to the librarian.

American books are now executed with great neatness and taste; their wood-engravings, notably those in *Harper's*, *The Century*, and *Scribner's Magazine*, have been brought to a pitch of remarkable beauty both in design and in printing, largely by help of improvements in process engraving. All these magazines have gained a firm footing in Great Britain. The *Bookbuyer* (1888) says that the seven leading magazines in New York have an average monthly circulation of 650,000 copies. The *Atlantic Monthly* and the *North American Review* have had as contributors and conductors the most eminent literary men that America has produced. Several English publishers have found it to their interest to have branch establishments in New York, while several American publishers have also branches in London. Owing to the prevalence of education, and the abundance of cheap series of books under the title of libraries, book-buyers in a humble position in life are much more numerous than they are in the United Kingdom.

By the provisions of the International Copyright Act (1886), a foreign author's rights are protected in Great Britain, Belgium, France, Germany, Hayti, Italy, Spain, Switzerland, and Tunis. Colonial

authors can also secure copyright without publication in the United Kingdom, and a work copyright in the United Kingdom is copyright in Canada. American cheap reprints of British books are admitted to Canada subject to a customs duty of 12½ per cent., to be paid over to the British author, but hitherto the returns from this source have been very small. It is understood that an American author by prior publication in England secures British copyright, although the matter has never been properly tested; the British author until 1891 had no such privilege in the United States. Hence the constant (but for long futile) proposal of plans for an international copyright arrangement, whereby an English author and his publisher might reap the benefit of an American sale, and *vice versa*. As the matter stood, British copyright books were freely reprinted to a public of more than 50 millions at a price from a few cents upwards. A book which sold in England at any price from a couple of shillings to a couple of guineas, could thus be reprinted and sold for little more than the price of paper and print. Bills were introduced into the American House of Representatives and the Senate without effect. The American Copyright League, founded by G. Parsons Lathrop in 1882, which soon attained a membership of several hundreds, including Mark Twain, Julian Hawthorne, Will Carleton, Howells, Stoddard, Boyesen, and other well-known authors, sought to influence the legislature in favour of some equitable arrangement. Dickens, Carlyle, Lytton, Besant, and other English authors, also spoke strongly on the subject. The American Publishers' Copyright League (1888) existed for a like purpose. At length, on 1st July 1891, an act came into force whereby copyright can be acquired by authors who are not citizens of the United States, provided two copies of the work be left with the librarian of congress not later than the day of publication, such book to be printed from type set up in the United States, or from plates made therefrom. See COPYRIGHT.

The 'libraries,' collections of cheap reprints of British copyright books, extend some of them to more than 500 volumes. The best known perhaps are Harper's *Franklin Square Library* (new series, 1888), Munro's *Seaside Library*, and Lovell's *Library*. Of the previous edition of the present Encyclopedia there are several unauthorised reprints. There is a reprint of all Ruskin's works at a much lower figure than one of his earlier books now costs in England; while his *Sesame and Lilies*, *Crown of Wild Olive*, and *Ethics of the Dust*, appear in one volume for about 2s., or about one-eighth of what Mr Ruskin charges for them in England. Fronde's *Carlyle* and George Eliot's *Life* can be had for fewer pence than they at first cost shillings in England. When the average published price of Black or Blackmore's novels in England was 6s. a volume, they could be bought in New York at 10 or 20 cents. Lord Tennyson has of course suffered along with other English authors. These unauthorised reprints, if imported into the United Kingdom, are liable to seizure by the custom-house officers. We have many examples, on the other hand, of American books being reprinted in England without anything being paid to the author.

The modern bookseller and publisher has many trade helps, the best of which are the following: *The London Catalogue*, giving a list of 42,340 works published between 1831-55; the *British Catalogue*; Low's handy and useful *English Catalogue of Books* (published annually); Whitaker's *Reference Catalogue of Current Literature* (first issued in 1874), which is a volume of publishers' catalogues in alphabetical order, modelled on the late F. Leyboldt's *American Trade List Annual*; Roorbach's *Bibliotheca Americana*, a

catalogue of books issued from 1820, continued by Kelly, in supplements, to 1871; and F. Leyboldt's *American Catalogue* (2 vols.) of authors and titles, the first volume of which has 70,000 entries. Sonnenschein's *Best Books* (1887; 2d ed. 1891) can be recommended. The recognised trade journals are in this country the *Bookseller* (monthly) and *Publishers' Circular* (weekly), in the United States the *Publishers' Weekly* and *American Bookseller*, all of which issue Christmas numbers containing announcements and criticisms of books, with specimens of the illustrations. The *Athenæum* prints a weekly list, with prices affixed, of works offered for sale in London. In Germany the *Borsenblatt* is the organ of the trade, but the Germans have also an encyclopedia of the book-trade, edited by Ebner and Weisbach, the *Encyklopädie des Gesamten Buchhändlerischen Wissens* (1887). The French organ of the trade is entitled *Bibliographie de la France*.

M. Millan & Co.'s Publications, 1843-89* (1889); Roberts's *Earlier History of English Bookselling* (1889); Arber's *List of Eight Hundred and Thirty-nine London Publishers between 1553 and 1640* (1890); Putnam's *Authors and their Public in Ancient Times* (1893); the lives of Lackington, Hutton, W. & R. Chambers, Constable, D. Macmillan (q.v.), Adam Black (q.v.), John Murray (q.v.), Hatchard; and the articles BIBLIOGRAPHY, BOOK, BOOKBINDING, COPYRIGHT, ILLUSTRATION, LIBRARY, NEWSPAPERS, PAPER, PERIODICALS, PRESS, PRINTING, STATIONERS' HALL, STEREOTYPING, WOOD-ENGRAVING.

Bookworm, any grub which feeds on the paper of books. The name more especially belongs to the larva of an anobiid (*Anobium pertinax*, *A. cruditum*, &c.), a small coleopterous insect, which is one of the Death-watch (q.v.) insects; though the larva of *Ceophora pseudospinetella*, a small brown moth, seems to have nearly an equal claim to it. The latter much resembles the anobiid, save that it has six legs, while the anobiid has none. Most people are familiar with the effects of the bookworm's ravages; but the creatures are extremely rare in this country, especially since so many chemical substances have been introduced into the manufacture of paper. In Southern Europe, the book-eating anobiid is still common enough. It is not unlike the little grub found in hazel nuts—has a soft body with a horny brown head and strong jaws, and readily succumbs to exposure. As it usually attacks from the boards inwards, the interior pages of a book are generally safe from its ravages; though M. Peignot asserts he found twenty-seven volumes standing in a row, pierced from end to end by a single worm-tunnel, and Mr Blades has known this happen with at least two volumes. In America, books in libraries, though free from the ravages of the bookworm, are infested and damaged by a small cockroach—the Croton Bug, or *Blatta germanica*. Probably several kinds of caterpillars of moths, and grubs of beetles, injure books more or less. See BORING-BEETLES, BOOK-LICE; Blades' *Enemies of Books* (new ed. 1888); *N. and Q.*, May 1885; *Booklore* (1886); *Antiquary*, vol. x.; and E. A. Butler, *Our Household Insects* (1893).

Boole, GEORGE, a distinguished mathematician and logician, was born at Lincoln, 2d November 1815, and received his education mainly from his father, an intelligent tradesman. He successfully started a school at Lincoln in 1835; devoted his spare time to study, and in 1849 became professor of Mathematics in Queen's College, Cork, a post he held till his death, 8th December 1864. He had long been one of the foremost mathematical

thinkers of his time. Among his publications are *Analytical Transformations* (1839), *General Method in Analysis* (1844), *Mathematical Analysis of Logic* (1847), and papers on Probability. His fame as a logician chiefly rests upon his *Laws of Thought* (1854). It has come to be regarded as a work of great originality and power, and is one of the first attempts at the employment of symbolic language and notation in a wide generalisation of purely logical processes.

Boom, a town of Belgium, 10 miles S. of Antwerp, with great brick and tile works, breweries, tanneries, rope-walks, sailcloth manufactures, salt-works, &c. Pop. 13,892.

Boom, in a ship, is a general name for the long spars which jut out from certain supports or uprights, to stretch or extend the bottom edge of sails. According to their connections, they receive the names of jib-boom, flying jib-boom, main boom, square-sail boom, &c. In the old 110-gun ships of Nelson's days, these booms varied from 57 to 32 feet in length. Modern ironclads are provided with a number of booms to be fitted at intervals along their sides, from which may be suspended a huge net encircling the ship at a sufficient distance from the side to render an explosion from an enemy's torpedo harmless. The term boom is also applied to a strong iron chain, or a combination of spars, &c., lashed together with chains and cables, and employed in barring the navigable passage of the mouth of a harbour or river. The wooden boom across the harbour was an important feature in the famous defence of Londonderry in 1689.

Boom is a word frequently used of late in America and Britain and the colonies for a start or rapid development of commercial activity or speculation, as when shares go off, or prices go up 'with a boom.' The word is assumed to be suggested less by boom in the sense of noise than by the rushing progress the noise often accompanies.

Boomerang, a wooden missile used by the aborigines of Australia in hunting and in war. It is of hard wood, bent in a curve, and is from 2 feet to 2 feet 9 inches long by from 2 to 3 inches broad. It has one side convex, the other flat, with a sharp edge along the convexity of the curve. The curve varies greatly in different instruments.

Various Forms of Boomerang.

When to be thrown, it is taken in the hand by the handle (which has cross cuts on it), and held up at arm's length over the shoulder. With the convex edge forward and the flat side down, it is then thrown directly onward with a strong quick fling, as if to hit some one 40 yards in advance. The hand is drawn back at the same time, with a movement like that in the 'screw-back' stroke at billiards. The missile slowly ascends in the air,

whirling round and round, and describing a curved line of progress till it reaches a considerable height, when it begins to retrograde, and finally, if thrown with sufficient force, falls 8 or 10 yards behind the thrower, or it may fall near him. This surprising motion is produced by the bulged side of the missile. The air impinging thereon, lifts the instrument in the air, exactly as by hitting the oblique bars in a windmill, it forces it to go round. It should be added that the path of the boomerang can be varied by the will of the thrower, and that the sweep of no two boomerangs exactly agrees. The force with which it flies is great; the Rev. J. G. Wood has seen a dog killed on the spot, and nearly cut in two by the stroke. The ingenuity of the contrivance, and the skill with which it can hit the mark aimed at, are very extraordinary as coming from almost the lowest race of mankind. Attempts have been made to derive it from some hypothetical high culture, but the intermediate forms between it and the war-club or battle-axe have been found in its own country, and there are good grounds for considering it really a native invention developed through such stages to its present form. 'Various missiles,' says Tylor, 'have been claimed as boomerangs: a curved weapon on the Assyrian bas-reliefs, the throwing-cudgel of the Egyptian fowler, the African *lissan* or curved club, the iron *hunganunga* of the Tibbás, but without proof being brought forward that these weapons, or the boomerang-like iron projectiles of the Niam-Niam, have either of the great peculiarities of the boomerang, the sudden swerving from the apparent line of flight, or the returning to the thrower.' Sir Richard Burton (in *The Sword*) alleges that some Indian throwing-sticks fly back.

Boondee. See BUNDI.

Boone, DANIEL, a famous American pioneer, was born in the state of Pennsylvania, February 11, 1735. At an early period of his life he emigrated to North Carolina; but his love of the wilderness not being sufficiently gratified there, he planned an expedition into Kentucky, then almost unknown. In June 1769, along with five companions, he halted on the Red River, a branch of the Kentucky. After a few months' hunting, he was captured by the Indians, but soon escaped, and accidentally falling in with his brother, who had pursued his track, lived with him in a cabin during the whole winter. In May 1770 his brother went home, and Boone himself was left alone in the perilous forest. In July his brother returned, and after exploring a considerable portion of country, they returned in 1771 to Carolina, determined to emigrate with their families to Kentucky; but the opposition of the Indians rendered the attempt unsuccessful. Shortly after, Boone was engaged as the agent of a Carolina company in purchasing the land on the south side of the Kentucky River, and here in 1775 he built a stockade-fort on the site now occupied by Boonesborough. In 1777 the place was twice attacked by a swarm of Indians, who, however, were repulsed. In 1778 Boone was once more captured, but once more managed to make his escape and reach the fort in time to repel, with his little garrison of fifty men, another determined Indian attack. On the admission of Kentucky to the Union, Boone lost his property for want of formal titles, and retired in 1798 in disgust into the wilderness of Missouri, which did not become United States territory till 1803. In 1812 his claim to a tract of land was allowed in recognition of his public services. Boone died at Charette, on the Missouri River, September 26, 1820. An account of his life, based on his own relation, was written by Filson in 1784, and lives

have been written by Flint, Bogart, and J. S. C. Abbott.

Booneville, a town of Oneida county, New York, 35 miles N. of Utica by rail, with manufactures of gloves, leather, and wooden wares. Pop. 4118.—There is another Booneville, or Boonville, in Cooper county, Missouri, 100 miles E. of Kansas City, with coal-mines near. Pop. 4141.

Boorde, or BORDE, ANDREW, facetiously styled by himself 'Andreas Perforatus,' was born about 1490, near Cuckfield in Sussex, and was brought up under the stern discipline of the Carthusian order. About 1528 he managed to get a dispensation from his vow, and next studied medicine, as he tells us, at Orleans, Toulouse, Montpellier, and Wittenberg, travelling moreover as wide as Rome and Compostella. On his return to England, he was patronised by Cromwell, and afterwards travelled in his behalf on a confidential mission through great part of France and Spain. The year 1536 he spent in practising and studying medicine at Glasgow, and tells us that he found the natives flattering and false. He next returned to London, thereafter crossed the seas and travelled by Antwerp, Cologne, Venice, and Rhodes to Jerusalem. After his return, he lived a while in London, then most likely in Winchester, where his flagrant immoralities soon brought him into serious trouble. In the spring of 1549 he found himself in the Fleet prison in London, and soon after he died. Boorde's chief works are his *Dyetary* and the *Fyrst Boke of the Introduction of Knowledge*, edited by Dr Furnivall for the Early English Text Society in 1870. His *Itinerary of Europe* has perished, but the *Handbook of Europe* survives, and the *Itinerary of England or Peregrination of Doctor Boorde* was printed by Hearne in 1735. Many books, moreover, have been fathered on the fantastic old reprobate, and some have asserted that he was the original 'Merryandrew.' The earliest known specimen of the Gypsy language occurs in the *Introduction*.

Boos, MARTIN, a Catholic priest, born 25th December 1762 at Huttenried in Bavaria, was from about 1790 the originator of a religious movement closely akin to those of the Protestant Pietists. From 1806, when he settled at Gallneukirchen, his influence spread widely among the Catholic laity, and extended to about sixty of their priests. Himself a staunch Catholic, he was often and bitterly persecuted, till in 1817 the Prussian government appointed him a professor of theology and teacher of religion at Düsseldorf. In 1819 he removed to Sayn, near Neuwied, and died there 29th August 1825.

Boot. See BOOTS AND SHOES.

Boot, also called BOOTS, or BOOTIKIN, an instrument of judicial torture, formerly used in Scotland to force confessions from persons accused of crimes, or answers from unwilling or suspected witnesses. Bishop Burnet in the *History of his Own Time*, and Sir Walter Scott in his *Old Mortality*, speak of the boot as made of iron; but the Rev. Thomas Morer in his *Short Account of Scotland* (1702), written from personal observation of the country at a time when the boot was still in use, describes it as 'made of four pieces of narrow boards nailed together, of a competent length for the leg, not unlike those short cases we use to guard young trees from the rabbits.' One or both legs of the person to be tortured having been placed in this case, wedges were inserted between the limb and the sides of the case, and these wedges were driven down by the executioner with a mallet or hammer, questions being at intervals put to the sufferer, until either he gave the desired information, or fainted away, or showed such endurance as satisfied the judges that no answer

could be extorted from him. In one case—that of a lad in Orkney in 1596—it is recorded that they struck as many as fifty-seven times. In another—that of John Fian, schoolmaster at Prestons, burned for sorcery in 1591—the victim 'did abide so many blows, that his legs were crushed and beaten together as small as might be, and the bones and flesh so bruised that the blood and marrow spouted forth in great abundance, whereby they were made unserviceable for ever.' 'Still,' it is added, 'he would not confess;' and, indeed, it is remarkable in how many cases we are told that the torture, agonising as it was, failed in its purpose. When the boots were first used in Scotland is not known. In a case where a deed of conveyance of land was challenged as a forgery in 1579, two witnesses, a clergyman and a notary, both of Forfarshire, were ordered to be 'put in the boots, gins, or any other torments, to urge them to declare the truth.' In a letter, preserved in the Record Office at London, Sir Francis Walsingham writes to the English ambassador at Edinburgh in 1583, that Queen Elizabeth desires that Father William Holt, an English Jesuit then in Scotland, may be 'put to the boots.' The boot was subject of allusion on the English stage in 1604; in Marston's *Malcontent*, printed in that year, one of the characters is made to say: 'All your empiries could never do the like cure upon the gout the rack did in England, or your Scotch boots.' A young gentlewoman of Aberdeenshire was tortured by the boot in 1630. Soon afterwards, it is said to have fallen into desuetude for about thirty years. It was revived after the insurrection of the westland Covenanters in 1666, and continued to be used throughout the reigns of Charles II., and James II., and during the first years of William III. The Claim of Right brought forward by the Scottish Convention in 1689, denounced 'the use of torture, without evidence, and in ordinary crimes, as contrary to law.' Notwithstanding, Neville Payne, an English gentleman who was supposed to have entered Scotland on a treasonable mission, was in 1690 put to the torture under a warrant subscribed by King William, and still shown in the Register House at Edinburgh. The boot was applied to one leg, the thumb-screws to both hands, but without any effect, although, in the words of one of the Privy-councillors, the torture, which lasted for two hours, was inflicted 'with all the severity that was consistent with humanity, even unto that pitch that we could not preserve life and have gone further.' This is believed to be the last time that the boot was used. But it was not until 1709, when Scotland had ceased to be an independent kingdom, that the British parliament enacted that in future 'no person accused of any crime in Scotland shall be subject or liable to any torture.' Torture is believed not to have been used in England after 1640. An instrument similar to that known in Scotland was in use in Germany under the name of 'Spanish Boots.' And in some collections there are shown iron boots which were heated to an unbearable degree on the foot of the victim (see TORTURE). For the boot in France, see Bingham's *Bastille* (1888).

Bootan. See BUTAN.

Boötes. in Greek Mythology, the son of Demeter and Iasion, who, being plundered of all his possessions by his brother, invented the plough, and cultivated the soil. He was translated to heaven with the plough and yoke of oxen, under the name of Boötes ('ox-driver'), which is still borne by a constellation beside the Great Bear (or

Wain). According to others, Boötes was the son of Lycaon and Callisto (see URSA MAJOR). The bright star *Areturus* is in Boötes.

Booth (from a Scandinavian word, seen in Danish *bod*, Icelandic *búu*, 'to dwell,' and perhaps in German *bude*), a covered stall or hut at a market or fair, from which goods are sold, still much used in the east of Europe and in Asia, and in England at Weyhill Fair, near Andover. As towns sprang up, the yearly fair was more or less supplanted by the weekly market. The slight booth which was set up in the same spot every week, had an irresistible tendency to become substantial and permanent; and the records of the twelfth and some following centuries are full of unavailing complaints against the encroachments which were in this way made upon the market-places and streets. Thus, Joceline of Brakelond chronicles the ineffectual efforts of his great and wealthy abbey, in 1192, to dislodge the burgesses of Bury St Edmunds from the shops, sheds, and stalls which they had erected on the market-place without leave of the monks. Stow relates that the houses in Old Fish Street, in London, 'were at the first but movable boards set out on market-days to show their fish there to be sold; but procuring license to set up sheds, they grew to shops, and by little and little, to tall houses.' The same chronicler tells us that 'in Cheapside, from the great conduit west, were many fair and large houses, which houses in former times were but sheds or shops, with solars (i.e. lofts or upper chambers) over them.' So in Edinburgh the range called at first 'the Boothrow,' and afterwards 'the Lucken-booths,' arose in the very centre of the High Street. The trader who for years had spread his stall under the shelter of the same buttress of the church or town-hall, began to rest a fixed wooden booth against it, gradually transforming the timber beams into lath and plaster, or even into brick or stone, until at length the basement of the stately cathedral or *hôtel de ville* was incrustated all over with unseemly little booths (or *kramcs*, as they were called in Scotland), like limpets on a rock. The booth which thus arose had often but one apartment, opening on the street by a narrow door, and a broad unglazed window, closed at night by a wooden shutter, dividing in the middle, and hinged at top and bottom, so that the upper half formed a sort of awning, while the lower half served as a table for the display of the trader's wares. It was at this window that business was conducted, the trader standing within, the buyer without. Traces of the middle-age booth still remain in this country, and in France there are many perfect examples, some believed to be of the 12th century.

Booth. BARTON, a celebrated 18th-century actor, born in 1681, the son of a Lancashire squire, nearly related to the Earl of Warrington. He received a good education at Westminster, and was just about to be sent to Cambridge when he chose a career for himself by becoming an actor. He first offered his services without success to Betterton, then played for two seasons at Dublin. A fresh application to Betterton was more successful, and in 1700 he appeared as Maximus in *Valentinian*, in Lincoln's Inn Fields, London. He was well received, and became at once a public favourite. In 1708 he appeared in Drury Lane, playing the ghost to the Hamlet of Wilks. In Downes' *Roscus Anglicanus* (1708), he is described as 'a gentleman of liberal education; of form venust; of mellifluous pronunciation; having proper gesticulations, which are graceful attendants of true elocution; of his time a most complete tragedian.' His performance of Cato in

Addison's tragedy in 1713 brought him to the height of his reputation, and yielded wealth as well as honour. Other great parts were Henry VIII., Othello, Brutus in *Julius Caesar*, Hotspur in *Henry IV.*, and Lothario in Rowe's *Fair Penitent*. He died at Hampstead, May 10, 1733.

Booth, JUNIUS BRUTUS, a distinguished English tragedian, the son of a lawyer of some note, was born in the parish of St Pancras, London, May 1, 1796. He received a classical education, but early manifested a predilection for the stage, and when seventeen years of age appeared in some unimportant parts. Subsequently he played Richard III. at Covent Garden, a part in which he suddenly became famous. In 1821 he migrated to the United States, where for the ensuing thirty years he followed his profession with much success. He died suddenly on board a Mississippi river steamer, November 12, 1852. He had long been subject to a natural eccentricity, which, at times, when aggravated by domestic affliction or habits of intemperance, developed into temporary insanity. —His son, EDWIN THOMAS BOOTH, American actor, was born in Harford county, Maryland, November 13, 1833. When sixteen years of age, he made his first appearance on the stage, in the part of Tressel, his father acting as Richard III. Two years later he himself successfully assumed the part of Richard in place of his father, who unexpectedly refused to fulfil an evening's engagement. The following year the two went to California, where the son remained for several years, visiting Australia meanwhile. Meeting with little pecuniary success, in 1856 he returned to the Atlantic states, and from that time thenceforward was recognised as a leading member of his profession. He visited England (1861–62), and in 1864 produced *Hamlet* at New York for 100 nights consecutively. In 1869 he opened a splendid theatre in New York, whose building cost over a million dollars, but which involved him in pecuniary ruin. He revisited California in 1876, and in the spring of 1877 was able to settle with his creditors, having earned during the season over £120,000. Booth visited Great Britain and Germany in 1880–82, and was everywhere received with enthusiasm. He died at New York, 7th June 1893. See his *Life and Art* by William Winter (1894). —JOHN WILKES BOOTH, another son of Junius Brutus Booth, was born at Baltimore in 1839, and was an unsuccessful actor. In 1865 he entered a conspiracy to avenge the defeat of the Confederates, and shot President Lincoln (q.v.). He broke his own leg, but managed to escape to Virginia and conceal himself till 26th April, when he was tracked, and, refusing to surrender, was shot.

Booth, REV. WILLIAM, founder and 'general' of the Salvation Army (q.v.), was born at Nottingham in 1829, was educated there, and from 1850 to 1861 acted as minister of the Methodist New Connection. From the first he was zealous in holding evangelistic services, but the new departure which led to the creation of the Salvation Army on military lines began in 1865 with mission work among the lower classes in the East End of London. Since 1878 Booth's movement has been known as the Salvation Army, of which he has continued to be the mainspring and controlling power, directing its movements at home and abroad from his headquarters in London. His enthusiasm and wonderful organising power have given life to the religious military system, of which he is really 'general.' The property of the Salvation Army is held for its exclusive use by Booth. His wife (1829–90) was fully associated with him in the movement and the publications dealing with it, and Booth has written *Darkest England and the Way Out* (1890).

See the *Life of Mrs Booth* by Tucker-Booth (1892), and the works quoted at SALVATION ARMY.

Boothia Felix, a peninsula on the north coast of North America, in which is the most northern part of the continent, Murchison Point, 73° 54' N. lat. It is joined to the mainland by Boothia Isthmus, is bounded on the N. by Bellot Strait, and to the E. is separated from Cockburn Island by Boothia Gulf, a southward continuation of Prince Regent's Inlet. It was discovered by Sir John Ross (1829–33), and named after his liberal friend Sir Felix Booth (1775–1850), a London distiller, who had furnished £17,000 for the expedition. Here, on the western coast, near Cape Adelaide, Ross discovered the magnetic pole, 70° 5' 17" N. lat., and 96° 46' 45" W. long.

Bootle-cum-Linacre, a northern suburb of Liverpool, including a large portion of the Liverpool docks, but since 1868 forming a separate municipal borough. Pop. (1861) 6500; (1881) 27,112; (1891) 49,217.

Booton, or BORTON, an island of the Malay Archipelago, separated by a narrow strait from the south-eastern ray of Celebes, and from the island of Muna. Area, 1700 miles. It is high, but not mountainous, and thickly wooded, produces fine timber, rice, maize, sago, &c. The people are Malays. The sultan, who resides at Bolio, is in allegiance to the Dutch, an under-resident being stationed on the island. Pop. 17,000.

Boots and Shoes. The foot-coverings of the human family are exceedingly varied in form, and they are not less diverse in the material out of which they are made. These differences are not merely due to the caprices of fashion and the influence of traditional costume and habit, but they owe their existence in large measure to the conditions of climate, and to the necessities of the daily life and occupations of their wearers. It must be at once obvious that the foot-coverings which would be sufficient and healthy amid tropical sands, would be most unsuitable for withstanding the rigours of a Greenland winter. The lightest sandal, which simply defends the sole of the foot, is appropriate for the one condition, while the other demands the closest, most warm, and water-tight covering which can be devised. The elementary foot-covering is the sandal, which consists only of a pad or sole shaped to the sole of the foot, and held on by straps or thongs. From the sandal grows up the slipper, in which straps and lacing are dispensed with, and a sufficient 'upper' of leather or other soft material is provided to keep the article on the foot. The ordinary short shoe is the next development, it being laced, buttoned, or otherwise fastened on the foot; and in the boot the upper is continued so as to embrace more or less of the leg.

The sandal is the most ancient foot-covering of which we have any record, and examples of very ancient manufacture, taken from Egyptian mummies, are preserved in public collections. The shoe frequently referred to in the Old Testament, and which played an important part in buying and selling, and in other social usages, was a sandal.

Fig. 1.

Fig. 2.

The common sandal of the ancient Egyptians (fig. 1) consisted of stripes of papyrus plaited into a kind of mat, and that form remains the type of sandal

of plaited grass or straw worn to this day by multitudes in Central Asia, India, China, and Japan. The sandal was the ordinary shoe of the ancient Greeks, an ornamental example of which is shown in fig. 2. In Greece, shoes were used only in exceptional circumstances, and long boots lacing up the front were worn by hunters. Sandals (*solææ*) were the everyday wear of the Roman populace; the patricians wore shoes (*calcei*) of black leather; red leather shoes were reserved for senators; and the long boot or 'buskin' (*cothurnus*), reaching sometimes to near the knee, and frequently supplied with a thick sole to add to the apparent stature of its wearer, was appropriated to tragedians and hunters. Sandals and slippers continue to this day to be the staple foot-gear of oriental communities, and great wealth of ornamentation—inlaying of wood in sandals, and elaborate embroidery in gold and coloured silks, with fantastic curling of the toes—are characteristics of the richer productions of the eastern tradesmen.

In mediæval times, shoes with long pointed toes were worn by the high-born; and towards the end of the 14th century these points became ridiculously elongated, so that there appeared to be a long strap projecting from each foot. Different kinds of half-boots were worn by the Anglo-Saxons and Anglo-Normans; and in the reign of Edward IV., if not earlier, the boot proper, with tops and spurs, was

FIG. 3.
Jack-boot.

established as an article of knightly dress. In the reign of Charles I., a species of boot, exceedingly wide at the top, made of Spanish leather, came into use; and with Charles II. the highly decorated French boot was introduced as an article of gay courtly attire. Meanwhile, the jack-boot, as it is called (see JACK), had become indispensable in the costume of cavalry soldiers and horsemen generally; and by William III. and his followers it was regularly naturalised in England. Fig. 3 is a representation of this highly characteristic boot, which we readily associate with the civil and foreign wars that distracted the 17th century. This huge species of boot remained in use in British cavalry regiments until comparatively recent times, and, in a somewhat polished and improved form, it is still worn by the Horse-guards. The jack-boot is almost entitled to be called the parent of the top and some other varieties. Boots with tops of a yellow colour were so commonly worn by gentlemen in the 18th century, as to become a peculiarity in the national costume of the English. When Philip, Duke of Orleans, and other revolutionists of note, affected to imitate the sentiments and manners of the English, they ostentatiously wore top-boots. Among jockeys and fox-hunters, top-boots are likely to remain in permanent use. What perhaps contributed to break

FIG. 4.
Hessian Boot.

up their general use, was the introduction of the Hessian boot as an article of walking-dress. Worn over tight pantaloons, the Hessian boot was a handsome piece of attire, giving, undoubtedly, an elegant appearance to the nether costume. A representation of a Hessian boot, with its tassel, is seen in fig. 4. Boots of this shape were worn by English general officers in the early part of the French war, and somewhat later. At length they were superseded by the well-known Wellington boot, which, as its name imports, was introduced by the great Duke, as a simplification, under the loose military trouser. When the name of Blucher was given to

a half-boot, the Wellington was almost entirely abandoned in England in consequence of the universal use of short ankle-boots. It is still largely used in some continental countries and in the United States.

The shoemaking industry of the United Kingdom, which has to do principally with boots and shoes made of leather, is divided into two departments—one the old handicraft, the other a factory industry. For many reasons the ancient domestic craft of shoemaking is dying out. Machinery and appliances for every operation are being gradually perfected, and although no machine work can equal in combined solidity and elasticity the productions of a first-class craftsman, superior operatives are comparatively scarce, and the products of the factory are at least even in quality, and much cheaper than hand-made boots and shoes.

Shoemaking as a handicraft is a sedentary and contemplative industry. The foot to be fitted being duly measured, the upper leathers are cut out and sewed together, an operation called 'closing.' The 'stuff' for the soles is then cut out of tanned ox-hide, the pieces being the insole, the outsole, and the lifts of the heel. These are steeped in water; a last or foot-model suitable for the boot or shoe to be made is chosen, and to the bottom of it the insole leather is nailed; and then by pulling and hammering it is moulded accurately to follow the contour of the last-sole. The edges of the insole are then pared and rounded down; the upper is drawn tightly down over the last, and its lower edge is nailed temporarily over the edge of the insole. A narrow strip of leather, the welt, sufficient to run round the whole sole excepting the heel part, is then selected, and the three edges, sole, upper, and welt, are by an inseaming stitch sewed together. The welt then forms a band to which the outsole is sewed around the edges. The heel lifts are built up, and sewed and nailed together; and thereafter the finishing operations include the burnishing of the sole and edges, the insertion of eyelets or buttons in the uppers, &c.

The shoe-trade as a factory industry only grew with the development of the sewing-machine, and now, except for repairing, there is scarcely such a thing as hand-sewing in the uppers of shoes. The great difficulty which, apart from hand-sewing, at first lay in the way of applying machinery to shoemaking, was in the fastening together of the sole and the uppers. Early in the present century, one Randolph, and a little later, the celebrated engineer, Sir M. I. Brunel, patented methods of fastening together soles and uppers by means of metal pins and rivets. The upper leather was drawn well over the insole, the outer sole was then applied, and the whole pinned together and riveted by the point of the pins coming against, and being turned by an iron-shod last inside. The germs of the modern sewing-machine were embodied in a patent secured in 1790 by Thomas Sant, the object of his invention being to sew boots and shoes; but the sewing-machine was not applied to boot-making till after its success in ordinary stitching was demonstrated. A machine for sewing together soles and uppers was patented in America by Blake, and as subsequently improved by Mackay, it became the apparatus which, for the period during which the patents were current, dominated the factory shoemaking industry. The Blake-Mackay machine sewed through outsole, upper, and insole at one operation; but as the corporation owning the machine held the patent right for machine-sewed boots and shoes, improvements by outsiders were for the time barred. Now there are in operation many varieties of sewing-machines, some of which sew welted boots in all respects like the hand-made product.

Factory-made boots and shoes are now entirely cut out by machinery, the uppers are sewn by strong sewing-machines, and soles and uppers are fastened together either by (1) sewing, (2) pegging with wooden pegs, (3) riveting with metal pins, or (4) screwing by means of the Standard screw machine. The latter most ingenious apparatus uncoils a reel of screwed brass wire, inserts it into the sole, and cuts off the wire flush with the outsole with remarkable rapidity; and for solidity and durability the work leaves nothing to be desired.

Both in the United Kingdom and in the United States, the factory trade in boots and shoes has since 1860 undergone a remarkable development. In America, the trade is generally distributed throughout the New England states, with its headquarters at Boston, Massachusetts. In the United Kingdom, Northampton is the capital of the industry, the other towns in which it forms a prominent feature being Leicester, Stafford, Norwich, Bristol, Linlithgow, and Maybole. A large export trade is carried on from the United Kingdom to the colonies.

Booty is the victors' share in property captured from the vanquished. It is generally a military term, the word prize being more generally used in the navy. For the regulations concerning prizes and prize-money in the British navy, see PRIZE.

Bopp, FRANZ, the distinguished philologist, was born at Mainz, 14th September 1791. By the lectures of Windischmann, he was led to devote himself to the study of oriental languages, a study which he continued under Chézy, De Sacy, and A. W. Schlegel at Paris. Here he composed his first work on *The Conjugation of the Sanskrit Verb* (1816), in which he scientifically demonstrated the original community of the Indo-European languages. He next removed to London, aided by a small pension from the King of Bavaria, where he published an improved edition of his previous work, and at the same time edited several episodes from the Mahābhārata. He returned to Germany in 1821, and some years after received the appointment of professor of Oriental Languages at Berlin, where he remained till his death, which took place 23d October 1867.

During these years he published his great work, *A Comparative Grammar of Sanskrit, Zend, Greek, Latin, Lithuanian, Old Slavonic, Gothic, and German* (1833-52); in a new edition he added Old Armenian. A final edition was published after his death (1871). It was translated into English by Eastwick (3d ed. 1862). In this work he elaborated his theory of the origin of grammatical inflection. According to this all the words of the Indo-European languages are derived from *monosyllabic* roots which are of two kinds, *verbal* and *pronominal*, and by the addition of one or several of such roots to another root, grammatical inflection is produced. Bopp further held that this stage of language, which has been called the *agglutinative*, was prior to the separation of the Indo-European languages, and that their succeeding history was one of phonetic decay, not of growth. It is in the treatment of this part of the history of language that Bopp is at his weakest. He allowed himself great latitude in dealing with phonetic laws, and finally showed he had no true method at all when he made the unfortunate attempt to connect the Malay-Polynesian languages (1841) with the Indo-European.

Besides the works mentioned above, Bopp wrote monographs on the Celtic, Caucasian, Old Prussian, and Albanian languages, as well as a Sanskrit grammar and glossary. See the Life by Lefmann (1892).

Boppard, a town of Rhenish Prussia, on the left bank of the Rhine, 10 miles S. of Coblenz.

The *Baudobriga* of the Romans, it was afterwards an imperial city till 1312, and the seat of a diet in 1234. Pop. 5610.

Bora, a strong, cold, and dry, north-east wind, which often rages with great severity in the Upper Adriatic, especially in winter, sometimes for eight or nine days together. Diez explains the word as a Milanese form of Italian *borca*, 'north wind,' from Lat. *boreas*; others identify it with an Illyrian *bura*, 'storm,' of Slavonic origin.

Bora, KATHARINA VON, the wife of Luther, was born of an old family in the district of Meissen, 29th January 1499. At a very early age she entered the Cistercian convent of Nimptschen, near Grimma. Becoming acquainted with Luther's doctrines, she found herself very unhappy in her monastic life; and finally, along with eight other nuns, whose relatives, like her own, refused to listen to them, she applied for assistance to Luther. Luther obtained the services of Leonhard Koppe, a citizen of Torgau, and by him and a few associates the nine nuns were liberated from the convent in April 1523. They were brought to Wittenberg, and Katharina became an inmate in the house of the burgo-master Reichenbach. Luther, through a friend, Amsdorf, offered her the hand of Dr Kaspar Glaz. She declined this proposal, but declared herself ready to marry Amsdorf, or Luther himself. Her marriage with Luther took place on 13th June 1525. She bore her husband three sons and three daughters, and is best described in Luther's own words as 'a pious, faithful wife, on whom a husband's heart could rely.' She died 20th December 1552 at Torgau. See Stein, *Katharina von Bora* (Halle, 1879); and Bayne's *Life of Luther* (1887).

Boracic Acid, or BORIC ACID, is found native (1) in the steam or vapour which rises from certain volcanic rocks in Tuscany, (2) as the mineral Sassolite, occurring largely in California, and (3) as a saline incrustation in the crater of a mountain in the island Volcano, in the Lipari group, 12 miles N. of Sicily. Boracic acid also occurs in combination in Borax, Datholite (q.v.), Boracite, Ulexite, and other minerals, and to a very minute extent in trap rocks generally. The plan of collection pursued in Tuscany is to form a series of caldrons—100 to 1000 feet in diameter, and 7 to 20 feet deep—partly by excavation, and partly by building, in the side of the volcanic mountain where the steam and boracic acid vapours are issuing from fissures, and divert the course of a mountain stream, so that at pleasure the caldrons or lagoons may be supplied with water. As the volcanic vapours gurggle through the water contained in the lagoons, the boracic acid is arrested by the water, which becomes impregnated with it. The liquid is passed from one lagoon to another, then on to settling-vats and flat-bottomed evaporating pans, till it becomes so concentrated that on cooling, impure crystals of boracic acid separate. In this condition it is exported.

The production of boracic acid from ulexite, a native borate of lime and soda found in California, has of recent years assumed importance. Ulexite is found as rounded concretions, white in colour, varying in size from $\frac{1}{4}$ inch to 12 inches in diameter, and is locally known as 'cotton balls.' After being broken down, it is heated to 200° F. (93.3° C.) along with three times its weight of water, and sulphurous acid gas is forced in till saturation takes place. The whole is allowed to settle, and the clear solution of boracic acid run off and crystallised. So prepared, it contains about 4 per cent. of impurities. In this process there are produced in addition to boracic acid the sulphates of lime and soda, as well as sulphuretted hydrogen. Native

boracic acid is employed as a source of Borax (q.v.), and contains about three-fourths of its weight of true boracic acid, accompanied by one-fourth of water and impurities. In a pure condition boracic acid may be prepared by dissolving forty parts of borax, $\text{Na}_2\text{B}_4\text{O}_7$, in one hundred of water, and acting thereon by twenty-five parts of hydrochloric acid, HCl , which removes the soda, forming chloride of sodium, NaCl , and water, H_2O , and on cooling the mixture, the boracic acid, HBO_3 , crystallises out. On re-solution in water and re-crystallisation, it is obtained in pure white feathery crystals. These crystals have the composition of $\text{HBO}_3 \cdot \text{H}_2\text{O}$, and on heating lose the whole of the water they contain, yielding boracic anhydride, B_2O_3 , thus:

Boracic acid is used in the arts as a flux, as an ingredient in the glaze employed in pottery; and the wicks of stearine and composite candles are treated with it, so that when the candle is burning, the end of the wick, when it gets long, may fuse and fall to the side, where it can be burned away. As an antiseptic and preservative of food, boracic acid is extensively employed either alone or along with borax. An ointment, called 'Lister's Ointment,' of great antiseptic power, is prepared from boracic acid, wax, and paraffin. In the preservation of butter, milk, wine, beer, meat, and fish, it is probably used to a greater extent than any other antiseptic. There is still much discussion as to the desirability of preserving food by this means, but as yet no authentic evidence has been produced to show that its use has been followed by evil results. Boracic acid is volatile when its solution in water or alcohol is evaporated, and when alcohol containing it is ignited, the flame has a green colour characteristic of boracic acid.—Boro-glyceride (q.v.), prepared by heating boracic acid with glycerine, possesses very valuable antiseptic properties.

Borage. *Borago*, or *Borrugo*, a genus of Boraginaceæ (q.v.), of which the three species are all natives of the countries around the Mediterranean. The Common Borage (*Borago officinalis*) is

Common Borage (*Borago officinalis*):
a, a flower.

found in waste places in many parts of Europe, and is pretty frequent—no doubt naturalised—in

Britain. It is a herb of somewhat stout and coarse appearance, but is easily recognised by its scorpioid cymes of few large ($\frac{3}{4}$ in.) beautiful blue flowers with purple-black anthers, spurred at the back. Borage was formerly much cultivated and highly esteemed, being reckoned amongst the *cordial* flowers, and supposed to possess exhilarating qualities, for which it no longer receives credit. The belief in its virtues was at one time extremely prevalent in England, its very name being, according to some, a corruption of *corage*, and its use correspondingly universal. The flowers were put into salads, Gerard tells us (1597), 'to make the mind glad;' and he adds: 'There be also many things made of them, used everywhere for the comfort of the heart, for the driving away of sorrow, and increasing the joy of the mind.' It was also frequently put in wine, and although it has no sensible properties, its traditional virtues still retain for its leaves a place in the preparation of claret-cup. The young leaves and tender tops are pickled, and occasionally boiled for the table, and are still used in salads in Germany.

Boraginææ. or BORAGINACEÆ, a chiefly herbaceous order of cordifloral dicotyledons, the alternate exstipulate leaves generally rough with hairs which proceed from a thick hard base (whence the old name *Asperifoliæ*), and the whole plant mucilaginous and emollient. The inflorescence is usually a scorpioid cyme; the calyx and corolla 5-lobed regular; the stamens epipetalous and alternate; and the primitively 2-lobed ovary becomes early divided into four 1-seeded nutlets, much resembling those of Labiata (q.v.), and with a single gynobasic style. The order Ehretiaceæ of some botanists differs chiefly in the fruit, which in the more typical species is a succulent drupe; and in the *Heliotropes* consists of four dry achenia more or less consolidated.—There are about 600 known species of the proper Boraginææ, and about 300 of Ehretiaceæ. The former are natives principally of temperate climates, and are particularly abundant in the south of Europe and in the temperate parts of Asia; the latter are more tropical, but not exclusively so. Borage (q.v.), Alkanet (q.v.), Comfrey (q.v.), and Forget-me-not (q.v.), are familiar examples of the former; the exquisitely fragrant *Heliotrope* (q.v.) is the best known of the latter. The drupes of some species of Ehretia are eatable.

Boras'sus. See PALMYRA PALM.

Borax. or BIBORATE OF SODA, is found native as a saline incrustation on the shores of certain lakes in Persia, Tibet, Nevada, and California, but it also occurs widely scattered over the world. It has been long known, but it was not till 1732 that its chemical nature was ascertained. At first, and till comparatively recent years, the main source was the crude article brought from Tibet in skins, and going by the name of *tincal*. As so obtained, the crystals were coated with a greasy matter, said to be derived from the skins, and this had to be first removed by means of soda before the borax could be refined. In 1856 the Californian sources of borax were discovered, the bottom of a lake being found to be covered to a depth of about 18 inches with a mud impregnated with borax, and containing large crystals of it. From this mud, by treatment with hot water and crystallisation, there is first obtained *concentrated* borax, and by further treatment this yields the *refined* borax. In other places in California the borax is found mixed with sand in a light granular form, containing about $\frac{1}{15}$ th of the pure salt, while large crystalline masses of it occur below the surface of the ground. In all these cases a similar method of purification is adopted. The importance of these deposits may be gathered from the figures showing the

production of borax in the Pacific States—viz. in 1872, 280,000 lb.; in 1876, 5,140,000 lb.; and in 1884, 3,732,000 lb. In Europe, large quantities of *artificial* borax are prepared from the Boracic Acid (q.v.) of Tuscany. This, mixed with carbonate of soda, is heated in a furnace, carbonic acid being liberated, and the crude salt is then dissolved in water to free it from impurities, and crystallised. The changes which take place in this operation are represented by the following equation:

The common variety of borax contains ten equivalents of water, $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$, and forms prismatic crystals; but another variety exists, known as *octahedral* borax, and containing only five molecules of water. Borax is soluble in twelve times its weight of cold water, and in half its weight of boiling water, yielding a clear solution with a slightly sweetish taste. It is of great use in the chemical arts owing to its properties of dissolving metallic oxides, and of forming a flux when heated with other substances. On this account it is much used in connection with the Blowpipe (q.v.), before which it yields different coloured glasses corresponding to the metals present. It is also employed in the manufacture of enamel, and for glazing or coating vessels in pottery, as also in the formation of the paste for artificial gems. To the metallurgist it is an aid in the readiness with which it promotes the fusion of metallic mixtures, and the separation of the metals; and to the solderer it is of service in forming a thin glassy coating over the edges of the metals, which prevents their oxidation at the time they are being joined together. It is used as a mordant in calico-printing, while as an adjunct to, or substitute for, soap in washing, it gives satisfactory results in the proportion of $\frac{1}{2}$ lb. to 10 gallons of water. For the toilet, borax in solution is invaluable, making in itself an admirable shampoo, while its utility for cleaning brush and comb are well known. A varnish prepared by boiling together one part of borax and five of shellac with water is used for stiffening hats; and as an insecticide it is very powerful, being specially destructive to cockroaches. For preserving meat, fish, butter, and milk, either alone, or along with Boracic Acid (q.v.), borax has a wide application, no less than 20,000 lb. having been supplied to the Chicago canning works in one year for the preserving of meat alone. Besides these technical uses, borax is much used in medicine as an antiseptic, being applied either in powder or as lotion. For ulcerating surfaces, and in the treatment of the infantile disease thrush, it is extensively applied; while throat lozenges, designed to relieve the hoarseness of public speakers, generally contain this valuable salt as a constituent.

Borda, JEAN CHARLES DE, mathematician and astronomer, was born in 1733 at Dax, in the French department of Landes. As early as 1756 his *Mémoire sur les Projectiles* procured him admission to the Academy of Sciences. Entering the navy, he busied himself with nautical, astronomical, and hydraulic investigations, and suggested great improvements in the form of vessels. In 1777-78 he did good service in the American war; in 1782 he was captured by the English on the voyage home from Martinique, but was permitted to return on parole to France, where he entered the ministry of marine. He died at Paris, 20th February 1799. He was a leading member of the commission intrusted with the measurement of a

meridian arc; and he rendered essential service to the new system of weights and measures.

Borde. See BOORDE.

Bordeaux, the third seaport of France, and the chief town in the department of Gironde, is beautifully situated in a plain on the left bank of the Garonne, about 60 miles from its mouth in the Atlantic, and 359 miles SSW. of Paris by rail. Transatlantic steamers can easily ascend with the flood to Bordeaux, which is accessible at all times to vessels of 600 tons. The commerce both by the Garonne and by railways is very extensive, and its long and crescent-shaped harbour, providing anchorage for 1200 ships, has a singularly noble appearance. But the quay accommodation is limited; most of the ships have to anchor in the stream, exposed to very high and swift tides. In 1867-79 a spacious dock was constructed at the lower or northern end of the town, with a depth at ebb-tide of 22 feet, and an area of almost 25 acres; and in 1888 the construction of stone embankments, iron jetties, and other improvements was commenced. The river is crossed by a noble bridge of 17 arches and 532 yards in length, erected in 1811-21. The old town has narrow crooked streets; but the newer parts of the city and the suburbs have wide streets, fine squares, and pleasant promenades lined with trees. In spite of damp winters and oppressive summers, as well as of its imperfect drainage system, Bordeaux is a healthy town. The cathedral of St André, which was consecrated in 1096, is remarkable for its beautiful towers, designed and built, it is said, by English architects during the English occupation. St Croix dates from the 10th century, and St Seurin is also very ancient. Several handsome large churches have been built between 1868 and 1881. Bordeaux is the seat of an archbishop, and contains a faculty of science and letters (rebuilt in 1885-87, and constituting part of the university of France, with 900 students), schools of theology, medicine, art, and navigation, an academy of arts and sciences, a valuable gallery of paintings, a museum, and an observatory. The Grand Théâtre is one of the largest and finest buildings of its kind in France. The public library has upwards of 160,000 volumes. Pop. (1872) 190,682; (1886) 235,374; (1891) 247,890.

The principal branches of industry are the production or preparation of sugar, brandy, liqueurs, vinegar, tobacco, printed calicoes, woollen goods, casks, paper, earthenware, glass bottles, capsules, labels, and chemical products. There are large dockyards, but shipbuilding has been practically at a standstill for some years. The old Canal du Midi connects Bordeaux with the Mediterranean; and a great canal has been recently proposed, to connect Bordeaux with Narbonne. Wine, brandy, vinegar, fruit, fish, lace, jewelry, ready-made clothing, and skins are among its principal exports, the largest trade being with England and South America. Bordeaux is an important centre of the French cod-fishing ships for Newfoundland and elsewhere. Annually about 1500 ships of from 1,000,000 to 1,500,000 tons enter, and as many clear the port, almost half the vessels being usually British. The value of imports runs to £13,000,000 or £16,000,000 a year, the exports somewhat less. The Bordelais held an exhibition in 1895.

Except those of Champagne, no French wines have been so much exported to foreign countries as those grown in the department of Gironde, especially the Medoc, and known as Bordeaux wines. Some of them are red (known in England as *Claret*), others white. The finest red wines are produced by the vineyards of Château-Lafite, Château-Margaux, Château-Latour (all Medoc

wines), and Haut-Brion, the best of the *vins de Graves*. St Julien and St Estéphe are of the second rank. The St Emilion wines are a distinct group. Of the white wines, the Château d'Yquem is the finest of *Sauternes*, others being Bonnes, Barsac, Preignac. Of late years, however, the ravages of the *Phylloxera* (q.v.) have seriously diminished the vintages, and large quantities of wine have been imported in consequence from Spain and Sicily, and either mixed with, or sold as, Bordeaux wines.

Bordeaux, anciently called *Burdigala*, was the capital of the *Bituriges Vivisci*, and being made by Hadrian the capital of Aquitania Secunda, it became both the principal emporium of the south-west of Gaul, and the seat of its best educational institutions. The only important Roman remains are the so-called 'palace of Gallienus,' really the ruins of a large amphitheatre. The town shared the fate of Aquitania, and suffered successively from Vandals, Goths, Franks, and Moors. It was taken by Charles Martel in 735; but was again spoiled by Norman plunderers in the 9th century. It became the capital of the Duchy of Guienne; and in 1152 passed, by the marriage of Eleanor of Guienne with Henry of Normandy (afterwards Henry II. of England), under the dominion of England. The town was for a considerable time the seat of the splendid court of Edward the Black Prince, but was restored to France in 1451. It was the seat of the Collège de Guyenne, in which George Buchanan and other noted Scotsmen were professors in the 16th century. During the Revolution it was the principal seat of the Girondists, and suffered fearfully at the hands of the Terrorists. Its inhabitants, disaffected to Napoleon's government, were the first to declare for the Bourbons in 1814. During the Franco-Prussian war, the first sittings of the National Assembly in 1871 were held here in the Grand Théâtre. Bordeaux is the birthplace of Richard II. of England, the poet Ansonius, and Rosa Bonheur.

Bordelais, the country round about Bordeaux, was a recognised division of the province of Guienne.

Bordentown, a town of Burlington county, New Jersey, on the Delaware, 6 miles SE. of Trenton by rail, and 28 miles ENE. of Philadelphia by rail or steamer. It has iron foundries, machine-shops, shirt-factories, shipyards, and great railway works. Pop. 4232.

Borders, THE, as denoting the tract of country lying immediately on both sides of the frontier line between England and Scotland, is a term somewhat elastic in its signification. *Geographically*, the frontier line runs diagonally north-east or south-west, between the head of the Solway Firth at the latter extremity, and a point a little north of the mouth of the Tweed at the other extremity; the counties touching upon this line being Cumberland and Northumberland on the English side, and Dumfries, Roxburgh, and Berwick on the Scottish side. The distance between the two extremities is nearly 70 miles as the crow flies; but, following the frontier line in its irregularities, about 110 miles. The line of division is for the most part a natural one. The middle portion, extending 35 miles, is formed by the high barrier of the Cheviot range, the watershed of which may be regarded as in general the line of division. Leaving the Cheviots in the south-west, the line descends for nearly 22 miles by the Kershope Burn, and the waters of the Liddel, the Esk, and the Sark, to the Solway Firth. From the north-east extremity of the Cheviots, the windings of the Tweed, for about 13 miles eastward, form the natural boundary. But at a point about 5 miles from the mouth of that river, the line strikes out semicircularly in a

north-easterly direction, till it reaches the east coast a few miles north of the town of Berwick-on-Tweed; the space thus inclosed, embracing within it what are known as the 'Liberties' of that town, having been at one time regarded as neutral territory between the two kingdoms. On the western Border, near the Solway, was a corresponding tract of country claimed by both kingdoms, and hence called the 'Debateable Land.'

While the above may be taken roughly as defining the Border in the geographical sense, the word has for *historical* purposes a wider signification, especially on the Scottish side. In old Scots Acts of Parliament applying to the Border district, and in general in Scottish history, the counties of Selkirk and Peebles, though they nowhere touch the frontier line, are embraced within the term. While, therefore, the southern limit of the English Border may be defined by a line drawn from Carlisle to Newcastle, following nearly the route of the Roman Wall, the Scottish Border may for historical purposes be described as a truncated or rounded triangle, its base-line extending from Wigtown Bay on the west to the mouth of the Tweed on the east, the apex or central portion running as far north as the town of Peebles, nearly 40 miles from the Cheviots. The territory thus indicated as the Scottish Border includes the whole of the counties of Berwick, Roxburgh, Selkirk, and Peebles, a considerable portion of Dumfriesshire, and part of Galloway.

There is yet a third and more popular sense in which the word Border is used, and here again affecting the Scottish side. This, which may be called the *literary* sense of the term, arises out of the extraordinary prominence which has been given to the vale of the Tweed, including its tributaries the Yarrow, the Ettrick, and the Teviot, by the splendid romances and poems of Sir Walter Scott, by the poetry of Leyden and the Ettrick Shepherd, by the ancient and traditional ballads relating to the district, and by the pathetic songs and legends more immediately connected with the Yarrow, and glorified by the genius of Wordsworth. While, indeed, all these three senses of the word—the geographical, the historical, and the literary—fall to be recognised in any formal treatise on the subject, it must be admitted that in ordinary usage the third or literary sense predominates. Hence, when Border tales or Border ballads or Border traditions are spoken of, it is the Scottish rather than the English side of the frontier that is referred to.

Although the name of the Border, or Borders, is not perhaps older than the 13th century, it is of interest to note that from the very dawn of British history the district so called has exhibited in its annals the characteristics of a frontier or borderland, in so far as it has almost constantly formed the boundary or point of contact between contending races and nations. It is first made known to us by Tacitus as part of the kingdom of Brigantia, or the territory of the Brigantes—probably a Welsh-speaking race of Celts—who ruled all the country between the Humber and Mersey as far north as the Firth of Forth. They were a strong, courageous, and warlike people, able for many years to keep the Roman cohorts at bay, and thus to serve as a check upon the northward progress of the invaders. It has even been suggested, on plausible grounds, that the great earthwork which runs almost parallel with the Roman Wall between Carlisle and Newcastle, was the work, not of the invaders, as hitherto supposed, but of these native tribes, and erected by them as a barrier against the advance of the Romans. The earthwork faces south, and is therefore presumed to have been built as a defence against the south (see paper by Professor Hughes

'On the Ancient Earthworks between the Solway and the Mouth of the Tyne,' in *Communications of Cambridge Antiquarian Society*, vol. vi., 1887-88). If so, we have here a defined frontier line as far back as the 1st century of the era. The district immediately to the north of this line and the Solway Firth was subsequently, however, conquered by Agricola, and held by the Romans, though not without many insurrections on the part of the natives, until the departure of the former from the kingdom. The district then became the common battle-ground successively of Picts and Britons and Angles, until the 6th century, when we again find it appearing in history under the name of Bernicia (a name regarded by Professor Rhys as traceable to the older Brigantia), and occupied by an English-speaking people. Bernicia, in the succeeding century, was conjoined with Deira to form the great kingdom of Northumbria, which kingdom as Brigantia had done, included all the territory between the Humber and the Forth. From the 7th to the 11th centuries, what we now call the Border district still continued to be the meeting-point of hostile races, the Scots of Dalriada and the Picts, and latterly the Scots alone, contending, now with the Angles, and now with the usurping Danes, for the possession of the country watered by the Tweed. At length, in 1013, the Scots, under Malcolm II., defeated the Angles of Northumbria in a great battle at Carham, near Coldstream, whereupon the Northumbrians ceded to the Scots the district then known as Lothian (q.v.), that is, the whole of the territory between the Tweed and the Forth. The Scots afterwards obtained possession also of Cumberland, but this was wrested from them by William Rufus in 1092. The Tweed, however, still remained as the boundary between England and Scotland on the eastern Border, until the frontier was finally adjusted, much as it exists, by a commission of both countries in 1222.

From the time of the rise of the Celtic dynasty of Scottish kings in the person of Malcolm II. a change for good is observable in the condition of the Scottish Border. Under his descendant, Malcolm Canmore, the aristocracy was strengthened by the settlement of noble Saxons and Normans; and by David I. were planted the great religious houses of Kelso, Melrose, Jedburgh, and Dryburgh, which could not fail to have a civilising and ameliorating effect upon the people and the country. On the English side the church had a less vigorous growth, having no such munificent patron as King David, yet there also it could boast of the fine cathedral of Carlisle, the Premonstratensian abbey of Alnwick, the ancient monastery and priory of Hexham, and the till more ancient and classic shrine of Lindisfarne or the Holy Island. The Scottish side of the Border made, moreover, at this time a great advance as compared with the English side. This advance was due not a little to its physical superiority. Northumberland, which marches with Scotland for fifty miles, and almost of itself constitutes the English Border, was mostly, with the exception of the south-eastern portion, a barren and bleak country. Even now, its western and northerly parts, with their high and uncongenial exposure, are little better than moorlands. The soil, being cold and wet and sour, is unfavourable to plant-life, and for miles on miles, in some places, scarcely a tree is visible. On the other hand, the Scottish Border, with its broad and fertile valleys fed by numerous streams, its valuable woodlands, and its green hill-pastures, was extremely favourable, notwithstanding its exposure to hostile inroads, for the settlement and support of a numerous and thriving population. Hence Berwick and Jedburgh and Roxburgh rose in the 12th century into towns of great wealth and im-

portance, having an extensive home and foreign trade, Berwick being described as the greatest seaport in the British island. But with the death of Alexander III., and the outbreak of the War of Succession, all this was changed. Berwick was captured by the English king and sacked; the castles of Jedburgh and Roxburgh were from time to time taken and retaken, being alternately garrisoned and demolished. Of the ancient busy trading town of Roxburgh, not one stone is left upon another; and of its great castle and fortress, but the merest vestiges. Even the splendid religious establishments—the abbeys, churches, and monasteries—did not escape spoliation and destruction, Melrose requiring, after the time of Edward I., to be almost rebuilt. On the English Border, the ruinous effects of these national wars were felt also, though not to the same extent; for in Northumberland was no town to speak of nearer than Newcastle, and the intervening moors and mosses afforded but scant booty to the spoiler. The Scots, therefore, in their reprisals, while not omitting to ravage the nearer dales of the Rede and the Till, were obliged to extend their inroads beyond the high and barren tracts of Northumberland; and it was the richer though more distant valleys of Durham and Yorkshire that heard the fierce war-cries of Randolph and the Douglas, and yielded to the invaders the harvest of the sword. Weardale and Teesdale were better hunting-grounds in which to 'drive a prey,' than the upper waters of the Coquet and the Tyne.

It was doubtless due to the exigencies occasioned by these constantly recurring Border wars and raids, from the 13th to the 16th century, that the whole country on both sides of the frontier became so thickly studded with castles and peel-towers, the numerous ruins of which still form a distinctive feature in Border scenery. These castles and towers, generally planted on heights overlooking the river-valleys, stood as a rule within sight one of another, in order that the signals of invasion or alarm might be the more rapidly spread from point to point. From a survey made in 1460, we find that Northumberland alone possessed thirty-seven castles and seventy-eight towers; and the Scottish side was equally well strengthened and defended. Among the larger and more important fortresses on the English side, were the castles of Wark, Norham, Alnwick, Newcastle, Carlisle, Naworth, and Cockermonth; and on the Scottish side, the castles of Berwick, Roxburgh, Jedburgh, Ferniehirst, Cessford, Bransholme, Hermitage, Lochmaben, Caerlaverock, and Threave; besides the hundreds of peel-towers and bastle-houses scattered over the country. On both Borders also grew up many fortified towns, upon whose walls the citizens by turns kept nightly watch and ward.

To narrate all the invasions that took place on either side of the Border would be to repeat great part of the general history of England and Scotland; but as giving some idea of the extraordinary havoc and destruction occasioned by these wars and invasions, two authentic reports may be referred to. In 1544 Sir Ralph Evers and Sir Brian Latoun, with an English army, invaded the Scottish Border, and between July and November they destroyed 192 towns, towers, barnkyns, parish churches, &c.; slew 403 Scots and took 816 prisoners; carried off 10,386 head of cattle, 12,492 sheep, 1296 horses, 200 goats, and 850 bolls of corn, besides an untold quantity of 'inside gear and plenishing.' In one village alone—that of Les-sudden (now St Boswells)—Sir Ralph Evers writes that he burned '16 strong bastle-houses.' Again, in September of the following year, the Earl of Hertford a second time invaded the country, and between the 8th and 23d of that month, he 'razed

and cast down' the abbeys of Jedburgh, Kelso, Dryburgh, and Melrose, and burned the town of Kelso. At the same time he destroyed about 30 towns, towers, and villages on the Tweed, 36 on the Teviot, 12 on Rule Water, 13 on the Jed, 45 on the Kale, 19 on the Bowmont, 109 in the parishes of Eccles and Duns in Berwickshire, with 20 other towers and villages in the same county. The places destroyed are all named in the report to the English king, along with a classified list of that terrible sixteen days' destruction, embracing 7 monasteries and friars' houses, 16 castles, towers, and peels, 5 market-towns, the immense number of 243 villages, with 13 mills, and 3 'spitals and hospitals.'

The Borders have likewise been the scene of some great historical battles. Of what may be called national contests, in which Scots and English armies were opposed to each other, there is the battle of Halidon Hill (1333), Otterburn (1388), Homildon Hill (1402), Piperden (1435), Flodden (1513), Solway Moss (1542), and Anrum Moor (1544). In three of these battles—Otterburn, Piperden, and Anrum Moor—the Scots were victorious. Of what may be called internal contests, we have the fight at Arkinholm, now Langholm (1455), between Scotsmen, when James II. broke the power of the Douglases; the battles of Hedgeley Moor, near Percy's Cross, and of the Levels, near Hexham (1463), between the English adherents of Lancaster and York, when the Lancastrians were defeated; the skirmish of Haliden, near Melrose (1525), between Scotsmen under Angus and Buecleuch, when Angus vanquished the Border chief; and the battle of Philiphaugh (1645), when Leslie drove Montrose off the field. Of many faction fights and deeds of daring, such as the Raid of the Reidswire (1575) and the rescue of Kinnmont Willie from Carlisle Castle (1596), the ancient ballad-writers are the best historians.

In order to provide against the exceptional tendencies of the Borderers on the one side of the frontier to fall out with and plunder those on the other side, the governments of both countries, in the 14th century, divided the frontier into the East, West, and Middle Marches, over each of which divisions wardens were appointed by their respective sovereigns. These wardens were salaried officials, and endowed with great administrative and judicial powers. They stood to their respective districts in the place of the sovereign; and the office was at one time hereditary, being practically vested as the prerogative of a few of the higher nobles who had estates on the Borders. At certain times, a day of truce was held, when the English and Scottish wardens met, examined each other's credentials, and settled any questions that might be in dispute between their followers. As in the case of the Raid of the Reidswire, these meetings did not always end peacefully. (For details as to the duties of the wardens, and the laws and usages of the warden courts, see *The History of Liddesdale and the Debateable Land*, by R. B. Armstrong, part i. 1883.) One district which was the cause of much trouble to the wardens of the West March, was that known as the Debateable Land, which lay partly in England and partly in Scotland. Its south boundary was formed by the Esk, from its junction with the Liddel to where it enters the Solway; and within the Debateable Land were comprehended the baronies of Kirkcandrews and Morton in Cumberland, and Brettaloch or Bryntallone (now Canonbie) in Dumfriesshire. It is first mentioned in a proclamation of 15th November 1449, as 'the lands called Batable or Threep lands.' Its chief families were the Armstrongs and Grahams, both clans being noted as desperate thieves and freebooters.

They had frequently to be dealt with by force of arms, till in the 17th century the Grahams were transported to Ireland, and forbidden to return upon pain of death. Other districts of the Borders from time to time called forth hostile visitations from the Scottish kings or their commissioners, when great numbers of the robbers were frequently seized and hanged. So late as 1606, the Earl of Dunbar executed as many as 140 of them. The union of the crowns removed some obvious grounds of contention between the English and Scottish people, and after the middle of the 17th century the Borders gradually subsided into a more peaceful condition.

The character and habits of the Borderers were much alike both on the English and the Scottish side. While the greater nobles lived in large and strong castles, the inferior gentry occupied the peel-towers, in which the accommodation might barely suffice for the wants of a small farmer of the present day. And yet the accommodation, meagre as our modern ideas would esteem it, was probably sufficient for the simple wants of a rude and hardy people, who must have set but little value upon movable and perishable property, knowing how liable they were to have it stolen or consumed, and how readily, by equally predatory means, they might replace it from the stores of others. The tie or feudal bond, on the Scottish Border at least, between the chiefs and the principal men of their clans, was that implied in the term 'kindly tenant'—i.e. a tenant who was of the kith, kin, or family of the chieftain, or who had held his lands in succession, from father to son, for several generations. This tie was not dependent upon payment of rent either in money or in kind, but upon kinship, and was for the binding together of the leading members of the clan in the common objects of self-interest and self-defence (see *Edinburgh Review*, July 1887, pp. 12, 13). In a state of society so constituted, it was inevitable that there should be much strife and contention, not only between the residents on opposite frontiers, but among the clans themselves, and many instances of cruelty and almost savage vindictiveness have been left on record; yet what to some extent redeemed this state of things from sheer barbarity, was the fine and elevating spirit of chivalry which actuated both knights and nobles, and which spread itself from them through men of less degree. Hence the achievements which have found lasting enshrinement in the Border ballads, instinct as these are with the poetry of action, of chivalrous bearing in love and war.

For the early history of the district, see Dr Skene's *Celtic Scotland* (3 vols. 1876-80); Professor Rhys's *Celtic Britain* (2d ed. 1884). For later periods: *Ridpath's Border History of England and Scotland* (1776); *History of Northumberland*, by Wallis (2 vols. 1769); by Hodgson (7 vols. 1820-58); F. H. Groome's *Short History of the Borders* (1887); and Family Histories by Sir William Fraser (q.v.). For general antiquities: Dr Collingwood Bruce's *Roman Wall* (3d ed. 1867); W. Sidney Gibson's *Descriptive and Historical Notices of Northumberland Castles, Churches, and Antiquities* (3 series); Scott's *Border Antiquities of England and Scotland* (2 vols. 1814-17); Sir T. Dick Lauder's *Scottish Rivers* (1874); and the great *History of Northumberland* (1893 *et seq.*); and *Proceedings of Scottish Society of Antiquaries, Archaeologia Aethiana* (Newcastle), *Berwickshire Naturalists' Club*, and *Harwick Archaeological Society*. For manners, customs, dress, weapons, superstitions, poetry, &c.: Scott's *Minstrelsy of the Scottish Border* (3 vols. 1802-3); Professor Veitch's *History and Poetry of the Scottish Border* (1877; new ed. 1893); Henderson's *Folklore of the Northern Counties* (2d ed. 1879). For local history: Tate's *History of Aburick* (2 vols. 1866); A. Jeffrey's *History and Antiquities of Roxburghshire* (4 vols. 1853-69); Dr W. Chambers's *History of Peeblesshire* (1864); T. Craig-Brown's *History of Selkirk-*

shire (2 vols. 1886); Mrs Oliver's *Upper Terriotdale, and the Scotts of Buccleuch* (1887). See BALLADS, CASTLE, PEEL-TOWER.

Border-warrant, an obsolete form of diligence used in the Border counties of Scotland for detaining the person of an English debtor. It was more rigorous than the general *meditatio fugæ* warrant. See DEBT, MEDITATIO FUGÆ.

Bordighera, a winter resort in the Riviera, North Italy, on a hill overlooking the Mediterranean, 7 miles WSW. of San Remo by rail. It was founded in 1470, but its modern progress dates from the opening of the Cornice road in 1823, and of railway communication. The place, which is noted for its palm gardens, suffered severely from earthquake in February 1887. Resident population, 2556. See Hamilton's *Bordighera*, translated from the French by Dowson (1883).

Bordone, PARIS, a painter of the Venetian school, was born of noble parentage at Treviso in 1500. He studied under Titian, to whom his works are often attributed; and under Giorgione. He worked in his native town, in Vicenza, and in Venice. In 1538 he was invited to France by Francis I., who employed him to paint portraits of himself and of leading members of his court. He was knighted by Francis II. At Augsburg he painted in the Fugger Palace, and at Milan in the chapel of St Jerome; and he died at Venice in 1570. His most important monumental work in painting was the six sacred subjects with which he decorated the dome of San Vincenzo, Treviso; and his 'Fisherman presenting the Ring of St Mark to the Doge,' now in the Academy, Venice, is ranked as masterpiece among his easel pictures. He is represented in the National Gallery, London, by 'Daphnis and Chloe,' and 'A Portrait of a Genoese Lady.'

Bordure, in Heraldry, a border surrounding a shield (fig. 1), generally said to occupy one-fifth of the field. Though sometimes an independent bearing, it is often a difference of a cadet; and the differencing of cadets by bordures, according to a definite system of rules, has never ceased to be in use in the heraldry of Scotland. There is a great variety in bordures. Besides being engrailed, invected, wavy, &c., they may be parted in many ways and charged. A bordure *compony* or *gobonated*—i.e. divided into sixteen squares (fig. 2)—is often an indication of illegitimacy; and in later times a bordure wavy has been used in England

Fig. 1.

Fig. 2.

Fig. 3.

(not Scotland) with the same significance. A chief or a canton is sometimes placed over a bordure: but this is not done when the bordure is a mark of cadency. It then always surrounds a coat, and may even surround a quartered coat, a very frequent arrangement in Scotland.

When, however, a coat having a bordure is impaled with another, the bordure is omitted along the line of impalement (fig. 3).

Bore, a tidal phenomenon at the estuaries of certain rivers, also called *Eagre*. When a river expands gradually towards a very wide mouth, and is subject to high tides, the spring flood-tide drives an immense volume of water from the sea into the river; the water accumulates in the estuary more rapidly

than it can flow up into the river; and thus there is gradually formed a kind of watery ridge stretching across the estuary, and rushing up towards the river with great violence and much noise. In some cases this ridge or bore is many feet in height. This phenomenon is observable in several British rivers, as the Severn, Trent, Wye, and Solway. The most celebrated bores are those of the Ganges, Brahmaputra, and Indus: in the Hoogly branch of the Ganges, the bore travels 70 miles in four hours, and often appears suddenly as a liquid wall over 7 feet high. That at Hangchoo-foo is very dangerous; and the Bay of Fundy is remarkable for its tidal phenomena. See TIDE.

Bore is the internal cavity of any kind of firearm. It is in most cases cylindrical; but in the Lancaster gun it was oval, and in the Whitworth hexagonal, both being also spiral; while in all rifled firearms it is furrowed with spiral grooves, and for the same reason—viz. to give that rotation which enables an elongated projectile to be used (see RIFLE). In most modern guns and small arms there is a chamber at the bottom of the bore. In breech-loading weapons this chamber is larger in diameter than the bore, in order that the cartridge and projectile may enter it easily. In muzzle-loaders it is generally of smaller diameter, but an enlarged chamber has been tried in some heavy guns in order to give more air space for the expansion of the gases when the cartridge is fired. The diameter of the bore is called the 'calibre.' In rifled guns it is measured, not from the bottom of the grooves, but from the smooth surfaces between them, called the 'lands.' Heavy iron guns were formerly cast solid and then bored out, but, as it is essential that the surface of the bore should be extremely hard to prevent its being 'scored' by the shot, endeavours were made in America to attain this object by casting them hollow, and cooling the inner surface more rapidly than the rest of the metal. Large guns of modern construction are, however, either made entirely of steel, as in the 'Krupp' process, or as in the Woolwich and Armstrong systems, have a steel tube, toughened in oil, for the bore, and strengthened outside by coils of wrought iron shrunk on over it (see CANON), so that the hardness of the bore is assured.

Boreas, the Greek name of the north-east wind, blowing towards Hellas from the Thracian mountains, and personified in mythology as the son of Astræus and of Eos or Aurora, and as brother of Notus, Zephyrus, and Hesperus. He was said to dwell in a cave of the Thracian Hæmus. He had a temple in Athens, because he destroyed the Persian fleet of Xerxes; and at Megalopolis, a yearly festival was celebrated in honour of his aid against the Spartans.

Borecole. See KALE.

Borelli, GIOVANNI ALFONSO, a distinguished mathematician and astronomer, and the founder of the iatro-mathematical school, born at Naples 28th January 1608, was educated at Florence, and became professor of Mathematics at Pisa, and of Medicine at Florence. Having taken part in a revolt, he was obliged to leave Messina, and spent the remainder of his life at Rome, where he died 31st December 1679. He carefully observed the motions of the satellites of Jupiter, then little known, and was one of the first to recognise the parabolic paths of comets. He wrote a treatise on fevers, and a number of works on subjects of applied mathematics, of which the most celebrated is that *De Motu Animalium* (Rome, 1680-81). In this work he applies the laws of mechanics to the motions of animals.

Borers, a name applicable to many beetle-like or Coleopterous insects in the family of wood-eaters

or Xylophaga, but peculiarly applicable to the genera *Pinus* and *Anobium*. The larvæ eat their way through wood, and when that happens to be furniture, the species of *Pinus*, &c. come to have some practical human interest. They are mostly inconspicuous animals, resting during the day in the larval tunnels, active and roving at night. *Pinus* *fier* is common all the world over, and both as adult and larva much too common in the experience of herbarium keepers, insect collectors, owners of stuffed birds, not to mention wearers of furs, and housewives generally. They are most readily got rid of by the lure of a damp cloth or by vegetable matter left in the room over night, and destroyed with its attracted victims in the morning. The larva of *Anobium striatum* does great damage to furniture made of soft wood. Its little round tunnels, looking as if made by a drill, and full of the finest powder formed from the devoured wood, are familiar enough.

Borer (*Anobium striatum*):
Natural size, and magnified.

The larva rests after a while, spins a silken cocoon, sleeps and grows for a time at the bottom of its hole, and finally emerges a miniature beetle, a dark-brown insect, with a proportionately large thorax overlapping the head, but not measuring in all much above a line in length. Like its relatives in this family, it pertinaciously feigns death when touched or alarmed, an instinct probably at first due to a pathological panic and paralysis, but now normal, habitual, and doubtless of advantage. Other species (*A. tessellatum* and *A. pertinax*), also found in furniture, but likewise, as is indeed usual, on trees, have in their adult stage some importance in the history of superstition as insects which produce a knocking noise, regarded as a presage of the approach of death. The adult is wont to knock against the wood with his upper jaws, but these 'blows, which are taken for the knocking of Death himself, are nothing but a knocking of the male at the door of his loved mate.' The larvæ should be smothered. There are many other genera of borers, *Lymeria* *nardale* on ship-timber, *Ptilinus* on books, *Apatte* on oak furniture, and so on; but the point of interest is the general habit of the family. See DEATH-WATCH, also BORING-ANIMALS.

Borgerhout, a suburb of Antwerp, on the Schyn, with manufactures of tapestry and tobacco, and dye and bleaching works, and a monument of Carnot, who defended it. Pop. 28,882.

Borghese, a family of great distinction in the republic of Siena, and afterwards at Rome. One of the family, CAMILLO BORGHESE, ascended the papal throne in 1605 as Paul V., and by him other members of the family were advanced to high positions. A marriage with the heiress of the house of Aldobrandini brought the Borghese family into the possession of great wealth.—CAMILLO FILIPPO LUDOVICO BORGHESE, Prince Borghese, born at Rome in 1775, joined the French army, and in 1803 married Pauline, the sister of Napoleon Bonaparte, and widow of General Leclerc. Under the French empire he was for some time governor-general of the provinces beyond the Alps, and held his court at Turin. He sold the Borghese collection of artistic treasures to Napoleon for 13,000,000 francs, receiving in part-payment the Piedmontese national domains; but

when these were reclaimed by the king of Sardinia in 1815, he received back some of the works of ancient art. After the overthrow of Napoleon he separated from his wife, and broke off all connection with the Bonaparte family. He lost Guastalla, which he had received through his wife, but retained the principalities of Salimona and Rossano, his hereditary possessions. He died in 1832.—The *Borghese Palace* is one of the most magnificent at Rome, and its collection of paintings is remarkably fine.

Borghesi, BARTOLOMMEO, COUNT, a distinguished Italian antiquary, born at Savignano, in 1781. At Bologna and Rome he devoted himself to archaeological researches. He next arranged and catalogued various collections of coins, including that of the Vatican. In 1821 he fixed his residence in the little republic of San Marino, where he lived devoted entirely to study, and died 16th April 1860. Borghesi did enormous service to Roman epigraphy and numismatics. See his complete works, published at the expense of the French government by the Academy of Inscriptions at Paris (vols. i.-ix. 1862-79).

Borgia, a family originally of Jativa, in the Spanish province of Valencia, where, at the time of the expulsion of the Moors (1238), the name figures among the *Caballeros de la Conquista*. One of its members, Alfonso de Borja (1378-1458), bishop, and private secretary to Alfonso of Aragon, accompanied that monarch to Naples, where he had gone to establish his rule. This Borja, chosen pope as Calixtus III., settled a number of his family in Italy. Rodrigo de Borja (1431-1503), his nephew, in turn ascended the papal throne in 1492, under the title of Alexander VI. (q.v.); and from that time the principal seat of the family was in Italy, while its name took the Italian form of Borgia. Before his elevation to the pontificate Alexander had had a number of children by a Roman girl, known in history as Vanozza, but whose real name was Giovanna Catanei (1442-1518). Two of these children, Cesar, the fourth, and Lucrezia, Duchess of Ferrara, the fifth, were destined to play important parts, and to acquire in history an unhappy renown.—CESAR BORGIA was born in April 1476, and died in 1507. An ambition that knew no bounds, energy that never flagged, and a contempt for laws divine and human, joined to qualities of the first order as a general and administrator, rendered him one of the most extraordinary figures of the Renaissance period. To arrest his vast projects, there was required a league of all Italy and of the most powerful sovereigns of Europe. Vowed to the priesthood from his birth, and from the age of seventeen invested with the dignity of cardinal, he early resolved to surmount all obstacles to his ambition; he shrank from neither sacrilege nor murder, and procured the assassination of his elder brother, Giovanni, Duke of Gandia, whom he shortly after succeeded in the post of captain-general of the Church, for which he readily doffed the purple to assume the breastplate. His father, Alexander, had made an alliance with Louis XII. of France for the invasion of the kingdom of Naples. In the Princess Charlotte d'Albret, sister of the king of Navarre, a bride had been found for Cesar, who, named Duke of Valentinois, with a rich pension and the promise of a company of two hundred lances for the support of the throne of St Peter, went to contract his marriage (11th May 1499) in France, and carried in exchange to Louis the papal bull, which was indispensable to the king before he could espouse his predecessor's widow, Anne of Brittany. Cesar's active life extended over no more than four years. Whilst his father

was crushing the feudal power of the barons of the Romagna, he undertook to recover, one by one, all the fiefs along the Adriatic coast which had ceased to acknowledge the over-lordship of the Holy See. In two successive campaigns, he made himself master of the Romagna, Perugia, Siena, Piombino, the duchy of Urbino; he went so far as to threaten Florence itself, and was planning the reconstruction of a kingdom of Central Italy, with himself at its head, when a powerful league was formed against him. His own officers sought to arrest his march, but he misled them by a feint, divided them, invited them to Sinigaglia, and there coldly passed on them sentence of death. Named Duke of Romagna by the pope, he was proceeding to menace Bologna and expel the family of Bentivoglio, when, on the eve of his departure for his third campaign, both he and his father were stricken with sudden illness while at a farewell banquet given by the Cardinal of Corneto. There was talk of poison. The old man succumbed (August 18, 1503), but Caesar's youth, and his extraordinary force of will, triumphed over the malady; the death of Alexander, however, was in effect the end of his projects, and his enemies now raised their heads. The election of Pius III. (a Piccolomini) gave him a moment's hope; the succession of Julius II. (Della Rovere), his bitterest enemy, after Pius's brief reign of twenty-seven days, was fatal to him. Caesar surrendered at Naples, under the promise of a safe conduct from the king of Aragon; but Gonsalvo de Cordova broke his oath, and (25th May 1504) had him arrested and carried to Valencia. After an attempt to break out of Chinchilla, where he was first imprisoned, he was removed to Medina del Campo, from whence, on the 25th October 1506, he made his escape to the court of Navarre. Here he took command of the royal forces against Luis de Beaumont, Constable of Navarre, who refused to surrender the citadel of Viana, which he held for the king; and in a sortie, 12th May 1507, at the age of thirty, Caesar Borgia fell, after heroically defending himself, at a place called Mendavia. Despite attempts to rehabilitate it, his memory remains in execration—despite, too, the estimate of Machiavelli, who had him in view when he wrote the *Prince*; he has moreover left among the peoples whom he governed, the reputation of a just prince, upright and severe, and of an able administrator. He encouraged art, and was the friend of Pinturicchio, and the protector of Leonardo da Vinci.—**LUCREZIA BORGIA**, born at Rome in 1480, married in the first instance Giovanni Sforza, Lord of Pesaro (June 1493); but her father, ambitious of a more advantageous alliance, annulled this marriage (20th December 1497), and gave her (20th June 1498) to Alfonso, Duke of Bisceglia, nephew of the king of Naples. The same motive induced her father and brother to separate her from her new husband, who was assassinated, 18th August 1500, by Michelotto, Caesar Borgia's bravo. For the third time free, the pope's daughter became, in spite of the repugnance of the Duke Ercole d'Este, the wife of the latter's son, Alfonso, who soon after inherited the duchy of Ferrara. Lucrezia has been represented as placed outside the pale of humanity by her wantonness, her vices, and her crimes; but the recent researches of most accurate and unprejudiced historians have demonstrated that in her youth, with no initiative, no choice permitted to her, she was rather the too pliant instrument in the hands of Alexander and of Caesar Borgia. She died 24th June 1519, enjoying the respect of her subjects, a generous patroness of learning and of art, whose praises were sung by the poets of her time; the closing years of her career being in singular contrast to her early life at the Vatican.

Borgo, a name given to a number of towns and villages in Italy and Southern Tyrol, and indicating the growth of the town or village around a castle or castellated rock, the original Borgo (see **BOROUGH**). Thus there are the *Borgo*, the north part of Rome, on the right bank of the Tiber; *Borgo-Manero*, an Italian town, 20 miles NNW. of Novara, with 4821 inhabitants; *Borgo San Donnino*, in the province of Parma, with 4493 inhabitants, &c.

Borgognone, **AMBROGIO**, a Milanese painter, whose real name was Ambrogio Stefani de Fossano. The assertion that he designed the façade of the Certosa of Pavia in 1473 is very doubtful; but he is known to have been working upon frescoes there in 1490, and the series, in which he was aided by his brother, Bernardino, is so extensive that it must have occupied many years. He returned to Milan in 1494; painted the tribune of the Incoronata, Lodi, 1497; and in 1508 produced an altarpiece, still in San Spirito, Bergamo. His latest undoubted work was a 'Coronation of the Virgin,' in San Simpliciano, Milan, 1524. His devotional subjects are characterised by a gentleness and a measured calm; but in treating dramatic incident he is frequently forced and exaggerated.

Borgu, or **BUSSANGA**, an African state attached by treaty since 1884-86 to the Royal Niger Company, lying on both sides of the Niger (q.v.), and bordering on Gando and Illorin, provinces of the empire of Sokoto (q.v.). The country is generally level, but rises in the north into lofty ranges of hills, and is very fertile and thickly populated. It was at Bousa, one of the chief towns, that Mungo Park lost his life in 1805.

Boring is a process in mechanical and engineering operations, variously performed according to the medium dealt with. For making small holes in soft woods and like substances, awls are employed, which merely cut and displace a portion of the yielding material. In boring hard woods and large holes, carpenters use gimlets, augers, and the brace and bits, which all cut and scoop out the material. In the jewelry and small metal industries, hand-drills, which consist of a spindle with steel bits, to which reciprocating rotation is given, are the implements for piercing small holes. The boring of holes in metal plates is effected by means of *drills* driven by machinery. The annexed figure shows the essential parts of such a boring machine. The drill is inserted in the end of a vertical spindle, P, which revolves in a fixed frame, and is driven by the bevel-wheels, G. The metal to be bored is placed on a table or other support below the drill; and the up-and-down motion, or end-pressure and off-action, of the drill is effected by the hand-gear, O, N, turning the screw, M; which being coupled to the top of the spindle at L, presses it down or raises it, according to the way it is turned. The spindle slides vertically in the collar forming the axis of the bevel-wheel, but is carried round with it by means of the pin, I, which projects into a groove seen at J.

The boring of cannon and of cylinders for steam-engines, and for the propeller shafts of

Boring Machine.

steamers, is most conveniently described under CANNON; see also LATHE.

As applied to the earth and to rocks, boring embraces two classes of operations—boring of shot-holes for Blasting (q.v.), and the sinking of bores in prospecting for minerals, and in forming wells for water, salt-brine, and mineral oils. Blast-holes in rocks are made from 1 to 2—sometimes more—inches in diameter, and may pierce to the depth of 9 feet. Such holes are most simply made in hard rock by a steel-pointed drill, struck by a hammer, and turned partly round after each blow to make the hole cylindrical. The addition of a little water serves to preserve the temper of the boring tool, and makes the rock more easy to cut. In soft rock, whenever the hole is to be vertical, a 'jumper' is used. This is a weighted drill, which acts merely by its own weight when let fall from about a foot in height. The powdered stone is removed at intervals by a 'scraper.' But in all great engineering undertakings rock-boring machinery now supplants hand work. The machines are principally devised to imitate the percussive action of the hand-drill, the boring chisel being worked and rotated by compressed air, and sometimes directly by steam. The compressed-air machines possess the great advantage of aiding in the ventilation of the working—often a most important consideration, seeing the operations are chiefly carried on in confined spaces where vast volumes of poisonous gases are evolved from explosions. The earliest practical rock-boring machine was that of Sommeiller, one of the engineers of Mont Cenis Tunnel, at which undertaking the apparatus was first used. Now the forms of percussion machines are very numerous, improvements being directed towards lightness and simplicity of parts, and to the method—automatic or otherwise—of advancing the boring tool as the work proceeds. Among the best-known machines

Darlington Rock-boring Machine.

are the Barrow, Burleigh, Darlington, Ferroux, Ingersoll, and McKean rock-borers. Diamond-drills working in the manner described below are also used. Brandt's rotatory borer is an apparatus similar in action to the diamond-drill, but with a crown of hardened steel in place of cutting diamonds. The tool is pressed against, and rotated by water-power. An apparatus similar in principle to the brace and bits of the carpenter is used with advantage in uniform rock such as slate.

The bores for deep wells of all kinds, and for discovering the mineral contents of a region, come under one category. As a preliminary operation in mining, boring is of the utmost importance for discovering the position, thickness, and dip of mineral strata or lodes, and for ascertaining the nature of the overlying deposits. Bores are made by three

classes of implement—(1) boring-rods, (2) rope-borers, and (3) diamond-drills.

The rod boring instrument consists of an iron shank, having a cross-bar at the top and a hollow screw at the bottom; to this all the successive boring instruments are fastened. A simple chisel is first attached to the screw, and one or two men press upon the cross-bar, and at the same time force it round like an auger; while another workman, by means of a lever erected overhead, with a chain descending from it to the cross-bar, gives an up-and-down motion to the instrument. When the chisel becomes clogged, from the accumulation of material which it has loosened, it is exchanged for a cylindrical auger, provided with a valve, which scoops out the separated material; and thus by alternate chopping and scooping the work is carried on. The nature of the strata is determined with considerable facility and certainty by examining the fragments brought up by the auger. As the work advances, successive lengths of rod are screwed on at the upper end. A derrick pole is erected over the bore-hole for the purpose of elevating the rods, to permit the change of the tools.

The rope method of boring has been long in use among the Chinese. By it the great loss of time, arising from the screwing and unscrewing the rods, at each elevation of the chisel or auger, is saved. The chisel and scooping instrument are fastened to a rope, which is alternately elevated and allowed to descend by the simple force of gravity; the instrument thus forces its way through the ground. In the softer rocks of the newer formations this method has been successfully employed in boring for artesian wells. The rope-boring machinery of Mather and Platt of Salford, in which a flat hempen rope is employed, is in extensive use.

For deep well-sinking, as in the Pennsylvanian oil region where depths of 2000 feet and more have to be reached, and for mineral prospecting, the diamond-drill has of late years largely superseded all other borers. With this apparatus the earth can be pierced at any angle, which is a great advantage in investigating mineral deposits; and moreover, the drill produces solid and continuous cores of the strata through which it passes, so that a complete section of any bore can be exposed to view. The diamond-drill consists of a 'crown,' or cylinder of steel, around one edge of which are fixed a series of black diamonds. These diamonds are so set that they project alternately a little beyond the outside and inside edge of the cylinder. This crown is screwed to lengths of iron tubing as it cuts its way by rotation into the rock, and it makes as it descends an annular cutting somewhat bigger than the thickness of the continuous tube, which the crown and its shaft form. Thus a core of rock is cut out and held within the tube, and the pieces may be lifted out from time to time as the work proceeds. The detritus resulting from the abrasion of the ring of rock is continuously washed away by a current of water forced down within the tubing. Diamond-drills are made of many sizes, from $1\frac{1}{2}$ up to 18 inches diameter. The prototype of the diamond-drill was M. Favvella's hollow boring-rod with steel crown described at the British Association meeting in 1846.

Boring-animals. While individual boring-animals are noticed under many separate articles (e.g. BARK-BEETLE, BEE, BIVALVES, BORERS, CATERPILLAR, SHIP-WORM, &c.), it may be convenient to indicate the widespread nature of the habit. Every one is familiar with the appearance of an oyster-shell on the shore riddled with small holes. This is the work of a small sponge, *Clione* or *Vioa*, one of which inhabits each hole. Other Clionids exhibit a similar power, but how the

boring is effected is not known. The action is probably both chemical by means of secretion, and mechanical by means of spicules. Many worms not only bore in the sand and soil, but into soft organisms like sponges, or among corals and the like. Some sea-urchins, being well equipped with a protruding masticatory apparatus, seem to bore or at least to improve holes for themselves. The Crustaceans can hardly be said to bore, though they burrow very considerably, as in the case of the common crayfish. One of the Isopods, however, *Limnoria terebrans*, devours the wood of harbour piles and the like, and does no little damage to such structures on northern coasts. Many insects are consummate borers both in their adult and in their larval stages. The work of the Bark and Boring Beetles (q.v.), and of the Carpenter Bee (q.v.), are good illustrations of this activity. The name bore-fly is sometimes applied to the large genus of Dipterous insects (*Trypeta*) whose larvæ do great damage to many plants. The most important borers, however, are the molluscs, especially such bivalves as *Pholas* (q.v.), *Xylophaga*, and *Teredo*. These belong to the large family *Pholadidae*, which includes some four-score species, all more or less efficient borers in wood or soft stone. Of these the Ship-worm, *Teredo* (q.v.) is probably the most formidable. A closely allied family of *Gastrochaenida* is characterised by the same habit; *Gastrochena*, *Clavagella*, and *Aspergillum* (q.v.) are the most important genera. A common bivalve on most coasts, *Saxicava*, is usually credited with considerable boring powers, but it seems probable that its activity has been overrated, and that it utilises old holes to a large extent. *Lithodomus*, belonging to the edible mussel family, is a powerful borer, and has left its marks on the well-known pillars of the Serapis temple near Naples. Many Gastropods, too, bore with their odontophores into the shells of other molluscs, into coral stocks, and the like; and any one who likes to confine snails in a paste-board box will soon have evidence of the rapidity of their boring powers. There is considerable divergence of opinion as to the exact way in which bivalve molluscs bore, but there can be little doubt that the foot rather than the shell is the chief agent.

Borissov, a town in the Russian government of Minsk, on the Beresina, 418 miles WSW. of Moscow by rail. Pop. 18,103.

Borkum, one of the East Frisian Islands, at the mouth of the Ems, 25 miles NW. of Emden. Pop. 684, increased in the summer by over 2000 visitors.

Borlase, WILLIAM, antiquary, was born at Pendeen, Cornwall, February 2, 1695. Educated at Tiverton and Exeter College, Oxford, he was presented in 1722 to the living of Ludgvan, near Penzance, and to the vicarage of his native parish of St Just in 1732. He devoted himself to a study of the natural history and antiquities of Cornwall, and in 1754 published his *Observations on the Antiquities of Cornwall*. His account of the Scilly Isles three years later drew from Dr Johnson the praise of being 'one of the most pleasing and elegant pieces of local inquiry that our country has produced.' His *Natural History of Cornwall* appeared in 1758. Soon after he presented his entire collections to the Ashmolean Museum. He had already been elected a Fellow of the Royal Society in 1750, and in 1766 his university gave him the diploma of Doctor of Laws. Borlase was one of Pope's correspondents, and furnished the poet with most of the curious fossils of which the Twickenham grotto was composed. He died August 31, 1772.

Bormio, a place with eight hot sulphur-baths, in the Italian province of Sondrio, 27 miles NNE. of Tirano. Pop. 1744.

Born, BERTRAND DE, a famous troubadour, born about 1140 in Perigord, who played a conspicuous part in the struggles of the English king Henry II. and his sons, during the latter part of the 12th century. He died before 1215. More than forty of his poems are extant, among them both glowing love-poems and strong and sarcastic satires. See his Life by Stimming (Halle, 1879).

Born, IGNAZ, mineralogist, born at Karlsburg in Transylvania, in 1742, was trained as a Jesuit, but became a lawyer and judge, and ultimately devoted himself to mineralogy. He prepared important catalogues, wrote several works, and introduced valuable new processes in mining, bleaching, and salt-working. He died in 1791.

Borna, a town of Saxony, on the Wyhra, 17 miles SSE. of Leipzig by rail. Pop. 7485.

Börne, LUDWIG, a noted German writer, was born 18th May 1786 at Frankfort, where his father, Jakob Baruch, was a Jewish money-changer. He first studied medicine at Berlin under the guidance of the Jewish physician Marcus Herz, to whose wife he addressed the letters published in 1861. From 1807 he studied law and political economy at Heidelberg and Giessen, and in 1809 he returned to Frankfort, where he was for two years (1811 to 1813) registrar of the police board. After this he devoted himself wholly to politics, and in 1818 he had himself baptised, changing his name from Löb Barnet to Ludwig Börne. In various journals started or edited by him (1812-21), he established his reputation as a vigorous opponent of the government. The French Revolution of July 1830 drew him to Paris, where he finally settled in 1832, and died of consumption 12th February 1837. His disappointment with the results of the Revolution drove him from the Liberal to the Radical camp. His views are fully developed in his *Briefe aus Paris* and *Neue Briefe aus Paris* (1832-38), which, while reproaching the German people with every kind of vice and folly, labour to incite the nation to revolution. He and Heine became bitterly hostile to each other; it was the mutual antipathy of a practical enthusiast and an æsthetic indifferentist. Börne's bright and polished style was for many years the favourite model of German journalists; his strength lay in witty satire, but the restlessness of his mind made all his productions fragmentary. The first edition of Börne's *Gesammelte Schriften* (1829-31) was followed by a more complete edition in 12 vols. in 1862-63 (new ed. 1868). In 1840 his biography was published by Gutzkow, and Heine gave vent to his hatred in *Heine über Börne*. See Gervinus, *Ueber Börne's Briefe aus Paris* (1838), and Beumann's *Börne* (1841).

Borneo, next to Australia and Papua the largest island in the world, is situated in the Indian Archipelago, in 7° 3' N.—4° 10' S. lat., and 108° 53'—119° 22' E. long. It is bounded on the E. by the Sea of Celebes and the Macassar Strait, S. by the Sea of Java, W. and N. by the Gulf of Siam and the China Sea. Its length is about 800 miles, with a breadth of 700, and an area of about 284,000 sq. m. The population is roughly estimated at 1,865,000, but may be more. The coasts, which are often low and marshy, and rendered dangerous to navigation by numerous islets and rocks, present no deep indentations, though they are pierced by numerous small bays and creeks. A great part of the island must be described as mountainous; but the relations of the various ranges and groupings are still very imperfectly known, and in very few cases has the

altitude of the leading summits been accurately ascertained. In the far north rises the magnificent structure of Kinabalu (13,698 feet high), built up of porphyritic granite and igneous rocks—the culminating peak probably of the whole Indian Archipelago, and not unworthy in its picturesqueness of such a rank. Throughout the narrow northern portion of the island there runs a kind of central ridge in a general south-west direction, with highest points ranging from 4000 to 8000 feet; and this can be traced, at least as a water-parting, far to the south-west; though broadly speaking, the whole southward country is corrugated and crinkled, as it were, in a most irregular manner. This is the

result of the great process of denudation carried on by the tropical rains, which, scooping out the interior valleys and plains, have laid down the vast alluvial tracts that extend seawards into deltaic morasses. As far as is yet known, the mountain framework of the whole island consists, like Kinabalu, of eruptive and crystalline rocks of high antiquity. Of modern volcanic activity, so prevalent elsewhere in the Indian Archipelago, there is in Borneo no trace either in tradition or in the record of the rocks. A large proportion of the surface, not covered by alluvium, consists of tertiary deposits, in regard to the age of which, however, geologists are not agreed. Pages might be filled with the mere nomenclature of the rivers of Borneo; the more important may be seen on the accompanying map. Though many are powerful streams, navigable far inland for boats of considerable burden, their value as waterways is lessened by the bars which usually prevent the entrance of sea-going vessels, and in their upper reaches by frequent rapids and occasional waterfalls. In connection with the river-systems there are numerous lakes in Borneo; but of true mountain-lakes on a large scale there are probably few. The great lake of Kinabalu, which figured in older accounts with 100 miles of circumference, is a pure myth, based perhaps on a misunderstanding description of the great grass-covered plain of Danao.

The climate in the low grounds is humid, hot, and unhealthy for Europeans; but in the higher parts towards the north the temperature is generally moderate, the thermometer at noon varying from 81° to 91° F. During the rainy season, from November to May, heavy storms of wind with loud thunder are experienced on the west coast. The influence of the land and sea breezes passes inland

to quite remarkable distances across the level plains and up the river-valleys. Vegetation is extremely luxuriant. The forests produce iron-wood, bilian, teak, ebony, sandal-wood, gutta-percha, dye-woods, benzoin, wax, dragon's blood, sago, various resins, vegetable oils, and gums. The camphor of Brunei is the best in Asia. The mohor tree, well adapted for making native boats, attains a height of 80, and the kaladang, suited for large masts, of 200 feet. Nutmegs, cloves, cinnamon, pepper, betel, ginger, rice, millet, sweet potatoes, yams, cotton in Ammutai, sugar-cane in Sambas and Montrado, indigo, tobacco, coffee in Sambas, pine-apples, coco-nuts, &c., are cultivated. The mountains and forests contain many monkeys, among which is the orang-outang. Tapirs, a small kind of tiger, small Malay bears, swine, wild oxen or banteng, and various kinds of deer abound. The elephant is only found in the north, and the rhinoceros in the north-west. The few domesticated animals are buffaloes, sheep, goats, dogs, and cats. A few horses are seen in Banjarmassin. Among the birds are eagles, vultures, Argus-pheasants, peacocks, flamingos, pigeons, parrots, and the swallows (*Collocalia esculenta*) which construct the edible nests prized by the Chinese for making soup. The rivers, lakes, and lagoons swarm with crocodiles, and many kinds of snakes, frogs, lizards, and leeches. Fish is plentiful, and the coasts are rich in tortoises, pearl-mussels, oysters, and trepang. Brilliant butterflies and moths are in great variety. Among the mineral products are coal, gold, and copper, especially in Montrado; antimony, iron, tin, platina, nickel, diamonds and other precious stones, rock-crystals, porcelain-clay, petroleum, and sulphur. The diamond mines are chiefly in Landak and Pontianak (q.v.); Sambas produces the greatest quantity of gold; the kingdom of Brunei, Kutei, and Banjarmassin, the largest amount of coal. The Pengaron coalfield, worked by the Dutch government, is one of the most important.

The population consists of three classes: the Dayaks or Dyaks (q.v.), who are the aboriginal heathen inhabitants, and constitute the great bulk of the population; the Mohammedans or 'Malays'—for this name is extended so as to include all professors of Islam, whether true Malays, Buginese, Javanese, Dyaks, or Arabs; and the Chinese. The Dyaks live chiefly in the interior, and employ themselves with tillage and the collecting of gutta-percha, resin, gums, ratans, gold-dust, and wax. They are divided into numerous tribes. The Malays (taking the name ethnographically) dwell on the coasts, are traders and bold sailors. They are more civilised than the Dyaks, cultivate the grounds around their houses, lay out gardens, keep cattle, and live partly by fishing. The Chinese, chiefly from Canton, have penetrated far into the interior. They engage in trade and mining, are unwearied in their efforts to make money, and then return to their native country. They have always endeavoured to live as independent republics (*kong-si*) under chiefs chosen by themselves, and according to Chinese laws. In 1857 the Chinese living in Sarawak rebelled, and were nearly exterminated. The Dutch were also compelled to put them down by force of arms, and have imposed a poll-tax.

The women of Borneo, except the Dyak, weave cotton fabrics, make earthenware, baskets, and mats of beautiful designs and colours. In the district of Banjarmassin are factories of weapons. The principal exports are gold, gold-dust, diamonds, coal, ratans, gutta-percha, edible nests, cotton, wax, timber, dye-woods, mats, resins, sandal-wood, camphor, &c.; the imports, earthenware, iron, steel, and copper work, piece-goods, yarns, woollen

and silk fabrics, medicines, provisions, wines, spirits, rice, sugar, tea, tobacco, opium, trepang, gambir, gunpowder, &c.

Borneo has never formed a political unity, and there is no native designation for the island as a whole. The name Borneo (Bornei or Brunei) in fact properly applies only to the Malay kingdom on the north-west coast; and Kalamantan or Kalamantin, sometimes quoted as a general appellation, is also of limited purport. The following are the present political divisions:

(1) *Borneo Proper*.—This originally included nearly the whole of the north-west of the island. The sultan has absolute authority. In 1847 he undertook not to surrender any of his territory to any other power without the sanction of the British government. The capital, Brunei, 20 miles from the coast, on the river of the same name, has at the most 20,000 inhabitants. The population of the country within its present limits may be stated at 125,000. Its area was reduced by the erection of

(2) *Sarawak* (q.v.) into a practically independent principality by Sir James Brooke (1841–68), though, like Brunei itself, the much larger state of Sarawak has since 1888 been under British protection; as also by the establishment of

(3) *The British North Borneo Company* as a recognised governing body. The company's charter, granted in 1881, transferred to them rights originally obtained by an American adventurer in 1865. This territory consists partly of a portion of the old kingdom of Brunei, partly also of districts on the east coast, claimed by the sultan of the Sulu Islands. Against the British occupation of the Sulu territory, a protest was made by Spain, which had for some time been gradually incorporating the sultan's possessions. As a matter of fact, the British North Borneo Company has been successful in appropriating and developing its territory, which, with an area of 30,709 sq. m., and a coast-line of 900 miles, is now divided into the East Coast Residency and the provinces of Dent, Keppel, and Alcock, and has its capital at Elopura or Sandakan, the largest settlement, with 5000 inhabitants. The population of the territory is estimated at 200,000.

(4) *Dutch Possessions*.—By far the largest part of the island is ruled directly or indirectly by the Dutch, who have divided it into the Residency of the Western Division of Borneo, and that of the Southern and Eastern, the former having Pontianak (q.v.) as the seat of government, the latter Banjarmasin (q.v.). Besides a number of smaller dependencies, the Western Division contains the kingdom of Landak, Tayan, Mampawa, Sukadana, Simpang, Matan, Sekadow, Sintang, Sambas. Among the separate states which go to form the Southern and Eastern Division are Kotaringin, Banjarmasin, and Martapura. In consequence of a decree of the sultan of Banjarmasin, the district watered by the Great Dyak or Kahayan is preserved for the native tribes, who in 1879 were estimated at 18,000 souls; Chinese, Malays, &c. are forbidden to ascend the river higher than the Kanpore Pilany. The same is the case with the basins of the Kapuas Murug, known as the Little Dyak district. The population of the whole of the Dutch portion of the island in 1894 was set down at 1,288,000, of whom about 1000 were Europeans, 35,000 Chinese, 2500 Arabs, and the rest 'natives' of various kinds. In the number of natives are included from 200,000 to 300,000 Malays settled along the coast, who used formerly to be counted amongst the strangers.

(5) *The Island of Labuan* (q.v.), off the coast of Brunei, has belonged to the British since 1846.

The chief towns in Borneo are Sambas (10,000), Pontianak (9000), Banjarmasin (30,000), Brunei (20,000), and Kuching (12,000).

The Chinese had commercial dealings with Borneo as early as the 5th century, but they made no settlement for a long time after. The Malay kingdom of Borneo proper dates back to the 13th century. Another Malay settlement of later origin, Sambas, was at first dependent on Johore (q.v.) in the Malay Peninsula. Sukadana was founded by Hindu Javanese from the kingdom of Majapahit (see JAVA), and spread its influence on the whole south part of the west coast. Mampawa was a Buginese settlement, and Pontianak was founded as late as 1771 by a colony of Arabs, Malays, and Buginese. Islam began to be preached by Arabs from Palembang in the 16th century.

The Portuguese effected a settlement in 1690 at Banjarmassin; from whence they were, however, soon expelled. The Dutch succeeded in concluding a treaty of commerce with the princes of Banjarmassin. They erected a fort and factory in 1643, and a second in 1778 at Pontianak. The British made unsuccessful attempts in 1702 and 1774 to effect a settlement in Borneo, but have within the present century acquired a preponderating influence on the north-western coast. See Wallace's *Malay Archipelago* (1869); Burbidge's *Garden of the Sun* (1880); Bock's *Head Hunters of Borneo* (1881); Frank Hatton, *North Borneo* (1885); *Handbook of British North Borneo* (1886); J. J. de Hollander, *Nederlandsch Oost Indië* (1884); Posewitz, *Borneo* (trans. by Hatch, 1892).

Borneo Camphor is a variety of camphor produced in Sumatra and Borneo. It is obtained from the tree *Dryobalanops camphora*, and is highly prized by the Chinese, who give for it from eighty to a hundred times the price payable for ordinary camphor.

Bornholm, an island in the Baltic Sea, belonging to Denmark, about 90 miles E. of Zealand, to the SE. of the Swedish coast. Area, 226 sq. m. It is rocky, and traversed from north to south by a high mountain-ridge (511 feet), the slope of which is in great part a waste heath, but elsewhere it is not unfertile, and agriculture and cattle husbandry are successfully prosecuted. High cliffs, sand-banks, and breakers make the coast dangerous. The most notable product of the island is porcelain-clay, with freestone, limestone, blue marble, and coal. The capital of the island is Rønne or Rottum, on the western coast, a place of 7000 inhabitants. Pop. (1890) 38,765.

Borning, or **BONING**, is a process of judging of the straightness or level of a surface or line by the eye, which looks along two or more *borning* or *boning rods* or *pieces* set up for the purpose. The term is used by masons, surveyors, and gardeners.

Bornu, a Mohammedan state of Central Sudan, bounded on the E. by Lake Tchad, and N. by the Sahara, and now mostly in Northern Nigeria (British), but partly in the German *hinterland* of Cameroon. Much of the country is perfectly level, and is liable to be overflowed in the rainy season (October to April). The heat from March to June is excessive, ranging from 104° to 107° F. The two principal rivers are the Shari and the Komadina Yaobe, both of which fall into Lake Tchad. The soil is fertile, yields plentiful crops of maize, millet, and other tropical produce. Wild beasts are very numerous. Coats-of-mail are made both for horses and their riders. The population, which is estimated at about five millions, are mostly of negro race, and called Bornuese or Kanuri. The ruling race, called Shuwas, are of Arab descent and bigoted Mohammedans; but many traces of fetishism remain among the masses. Whatever they have of civilisation is derived from the Arabs. The shores and islands of Lake Tchad are inhabited by negro pirates called

Yedina or *Budduma*. The slave-trade is eagerly prosecuted in Bornu. In the beginning of the 19th century, Bornu was conquered by the Fellatahs, whose yoke, however, was soon shaken off under the leadership of a fanatic fakir named Moham-med-el-Amin. The ruins of Birni, the old capital, on the Yaobe, may still be seen. Kuka or Kukawa, the present capital, on the west shore of Lake Tchaad, has a population of about 60,000, and is one of the great centres of trade in the Soudan, carried on by caravan routes across the Sahara. Other towns of over 10,000 inhabitants are Birni, Bundi, Gummel, Mashena, Borsari, and Surrikolo.

Boro Budor (the 'Great Buddha'), the ruin of a splendid Buddhist temple in Java, residency Kadu, near the junction of the Ello and Progo, is the most elaborate monument of the Buddhist style of architecture anywhere existing. Buddhism was early introduced into Java, and Javanese chronicles place the building of the temple in the beginning of the 7th century; there are no inscriptions, but it was probably finished between 1400 and 1430. Boro Budor is built on a low hill,

Half-elevation of one side of Temple of Boro Budor.

between four vast volcanoes, which supplied the blocks of trachyte of which the edifice is built; its height to the cupola is 118 feet. It is a pyramid of a square form, each side at the base measuring 520 feet, and consists of seven walls, which are built like the steps of a stair up a hill. Between the walls are narrow terraces running round the building; in each is an arched doorway leading to the next higher terrace. These walls are richly ornamented with statuary. Outside are over 400 niches topped with fantastic domes, and each occupied by a large statue of Buddha. Between each of these are bas-reliefs, including figures of the god seated, and architectural ornaments and carvings of all sorts. Below the niches, on the lower story, is an immense bas-relief running round the whole building, representing scenes from the life of Buddha, and religious subjects. The inner faces of the building are also profusely ornamented with bas-reliefs, representing battles, sea-fights, processions, and chariot-races, carried to an extent unrivalled by any other building in the world. Of the large reliefs alone there are over 2000; and most of them are as vigorously designed as they are carefully executed. Within the upper square terrace are three circular ones, the outer ornamented with 32, the next with 24, and the upper with 16 small bell-shaped shrines (*dagops*), each containing a seated statue of Buddha, which can be seen through the open works of their roofs. The whole is surmounted by a cupola, the principal and probably the most ancient part of the structure. It is now empty, a sunken chamber 10 feet deep representing what was, no doubt, a *dagop* intended to contain the precious relic for which this splendid temple was erected. The niches containing the cross-legged figures have been supposed to be a copy, in durable architecture, of the

cells of a Buddhist monastery, each occupied by a shaven priest; the cupola is rather to be classified with the topes or stupas of Afghanistan. The structure is thus a compound of a Tope (q.v.) with a copy, in durable architecture, of the frail cells of a Vihara (q.v.). See Leemans, *Boro-Bodoe op het eiland Java* (Leyden, 1873).

Borodino, a village of Russia, 70 miles W. of Moscow. It is situated on the Kaluga, an affluent of the Moskwa, and gave name to the great battle fought between the French army under Napoleon and the Russian under Kutusoff, 7th September 1812. The battle of Borodino was one of the most obstinately disputed in history, and the loss on both sides was almost equally great. Out of 257,000 men engaged, between 70,000 and 80,000 were killed and wounded. The Russians retreated on the following day, but in the most perfect order, and therefore claim this battle as a victory; but the honour certainly belongs to the French, who name the battle from the Moskwa.

Boroglyceride, a compound prepared by heating together 62 parts of boracic acid and 92 parts of glycerine. It is extensively used as a preservative of food, and also in antiseptic surgery, combining, as it does, the valuable properties of the above-mentioned substances.

Boron (sym. B, eq. 11) is a non-metallic element present in boracic acid and Borax (q.v.). It was discovered in 1808 by Gay-Lussac and Thenard in France, and Davy in England. In some respects boron resembles carbon, existing like it in the so-called amorphous, graphitoid, and diamond forms. In the amorphous or pure state, prepared by heating boric anhydride with sodium, it is an olive-green powder, very slightly soluble in water, and unaltered by exposure to moist air. When heated in air, it takes fire, uniting with oxygen to form boric anhydride, B_2O_3 (see BORACIC ACID). The graphitoid and diamond boron are not pure forms of the element, but contain a definite proportion of Aluminium (q.v.). The diamond boron is obtained by heating the amorphous form to a high temperature, along with aluminium, when boron is left as minute crystals interspersed through the earth alumina. These crystals possess great interest from their similarity in properties to pure crystallised carbon, or the diamond. They are remarkably transparent, are tinged yellow or red (though the colours may be accidental), and rival the ordinary diamond in their lustre and refractive power. Boron diamonds not only scratch glass, but also the corundum and the sapphire; they are, however, somewhat softer than real diamonds.

Resembling as in some degree they do the carbon diamond, it was at first hoped that as the method of manufacture became perfected, they would be obtained sufficiently large to become a serious rival to the natural carbon diamond; but as yet they have only been obtained in very small crystals, and their advent in the diamond-market is therefore problematical. They are very indestructible, even withstanding a temperature sufficient to burn the ordinary diamond.

Boron forms but one oxide, Boracic or Boric Anhydride, B_2O_3 (see BORACIC ACID), while it unites with chlorine and bromine directly to form a chloride, BCl_3 , and bromide, BBr_3 .

Borough (A.S. *byrig*, *burg*, *burgh*; It. *borgo*; Fr. *bourg*; Scot. *burgh*). The original meaning of this word, by which we now designate a corporate township, seems to have been a hill, rising ground, or heap of earth; and it was probably from the elevated positions on which places of defence were erected, that it afterwards came to signify a fortification or castle, and latterly the

aggregate of houses, churches, and other structures, which, in unsettled times, usually gathered under the walls of a castle; together with their inhabitants, and the arrangements which were made for their government. The questions whether we owe our municipal corporations to Roman, or to Saxon and other Teutonic influences, or to both; and if to both, then to what extent they have severally contributed to their formation, have been keenly discussed by constitutional historians. In so far as etymology goes, its authority is pretty equally divided, the term *municipal*, from the Latin *municipalis*, and *city*, from *civitas*, favouring the Roman view; whilst *borough*, from the root above indicated, and *town*, from the Anglo-Saxon *tūn*, 'an inclosure' (cf. Ger. *zaun*, 'hedge'), support the Teutonic. But the discussion forms a branch of a very wide subject, which has divided recent writers into two opposite schools. The Teutonic side is espoused by most of the Anglo-Saxon scholars of England, and in general by German writers. But from whatever source derived, that the boroughs of England existed, not as aggregates of houses merely, but as corporate bodies, in the Saxon time, is now generally admitted. The borough system of Scotland is also of great antiquity. A *Hanse*, or confederation of free burghs for mutual defence and the protection of trade, existed in Scotland, and was known by this name in the reign of David I. (1124-53), more than a century before the formation of the Hanseatic League of the continental cities; and the famous Burgh Laws date from about the same period. 'This code of Scotch burghal regulation,' in Mr Cosmo Innes's opinion, 'though collected in the reign of David, and sanctioned by him, was the result of the experience of the towns of England and Scotland;' and Mr Innes points out the close resemblance between these laws and the burghal usages of Newcastle, and even of Winchester, which seems to suggest their common Saxon origin. Mr Innes also speaks favourably of the burgh life of our ancestors, and considers the burgh domestic architecture, of which monuments remain, sufficient to show that 'the burgh of the Reformation period lived in greater decency and comfort than the laird, though without the numerous following, which no doubt gave dignity if it diminished food.'

Of the boroughs and cities of the middle ages, some were entirely free; they had, like the provincial towns of Italy before the extension of the Roman conquests, a constitution independent of any other powers. Venice, Genoa, Florence, Hamburg, and Lübeck all stood in this position. Next in dignity were the free imperial cities in Germany, which, not being comprehended in the dominions of any of the princes, were in immediate dependence on the empire. Most of these cities rose into importance in the 13th century; and their liberties and privileges were fostered by the Franconian emperors, to afford some counterpoise to the growing power of the immediate nobility. Nürnberg was especially celebrated for its stout resistance to the House of Brandenburg, and the successful war which it waged with the Franconian nobility. In England, the more important cities were immediate vassals of the crown; the smaller municipalities sometimes owned a subject superior, sometimes a greater municipality for their overlord.

Under the Anglo-Saxons, the English boroughs were subject to the rule of an elective officer, called the 'Portreve,' who exercised in the borough functions similar to those of the shire-reve in the shire. The Norman conquerors recognised the already existing privileges of the towns by granting them charters. Instead of a shire-reve, a viscount was placed by the king over each shire, and a bailiff

instead of the former elective officer over each borough. In the larger towns, the bailiff was allowed to assume the Norman appellation of Mayor. The municipal franchise seems to have been vested in all the resident and trading inhabitants, who shared in the payment of the local taxes, and performance of local duties. Titles to freedom were also recognised on the grounds of birth, apprenticeship, marriage, and sometimes free gift.

In all the larger towns, the trading population came to be divided into guilds or trading companies, through membership of which companies admission was obtained to the franchise. Eventually the whole community was enrolled in one or other of the guilds, each of which had its property, its by-laws, and its common hall, and the community elected the chief officers. It was on the wealthier and more influential inhabitants that municipal offices were generally conferred; and the practice gradually gained ground of these functionaries perpetuating their authority without appealing to the popular suffrage. Contentions and disputes arose regarding the right of election, and eventually the crown threw the weight of its influence into the scale of self-elective ruling bodies. As the greater municipalities grew in strength, we find their right recognised to appear in parliament by means of representatives. The sheriffs were considered to have a discretionary power to determine which towns should, and which should not have this privilege of representation. The sovereigns of the House of Tudor and Stuart acquired the habit of extending the right of parliamentary representation to boroughs not in the enjoyment of it, while at the same time, by granting or renewing to them municipal charters, they modelled the constitution of these boroughs to a self-elective type, and restricted the right of voting in the choice of a representative to the governing body. During the reigns of William III., Anne, and the earlier Georges, the influence of the crown was largely employed in calling new municipal corporations into existence, with a view of creating additional parliamentary support for the ministry in power. The boroughs of Scotland had a history much like that of the boroughs of England; their earlier charters were mere recognitions of already existing rights, and were granted to the inhabitants at large.

In its modern sense, a borough (*or* burgh) is commonly understood to mean a city or other town that sends burgesses to parliament—a privilege the nature and extent of which will be explained under PARLIAMENT (q.v.). But apart from their importance as areas for the parliamentary franchise, boroughs are important units of local government in the United Kingdom. Following, as a necessary consequence, the great change in the political franchise introduced by the Reform Act of 1832, came the reconstitution of the municipal corporations—separate acts of parliament for this purpose having been passed for England, Scotland, and Ireland respectively, within the succeeding ten years.

I. In England, by the Municipal Corporations Act, 1835 (5 and 6 Will. IV. chap. 76), one definite form of government was imposed upon boroughs, and all charters inconsistent with the purpose of the act were abrogated. In 1886 there were 282 municipal boroughs in England, of which 178 were included in the Act of 1835, differing greatly both in population and rateable area. By the Municipal Corporations Act, 1882, the last-mentioned act, and various amending statutes, were consolidated and amended. They are governed by corporations, called Town-councils, consisting of a mayor, aldermen, and common council of burgesses; the number of councillors varying from forty-eight to twelve. The mayor and aldermen are chosen

by the council, and the councillors are elected by ballot by the burgesses. They serve gratuitously. The qualification required for a councillor or alderman is in addition to ordinary burghership, £1000 property, or £30 rating, in the larger boroughs (when divided into four or more wards), and £500 property, or £15 rating, in other cases. On the other hand, the qualification required for the municipal franchise consists, in the ordinary case, of those who are on the burgess roll, or who occupy a house or other building, and reside within seven miles of the borough boundaries, and who pay poor and borough rates. Females, though excluded from the parliamentary, are entitled to exercise the municipal franchise. The tenure of office is, in the case of the mayor, one year; in the case of the aldermen, six years; in the case of the councillors, three years. The town-clerk, the treasurer, and other officials, are appointed by the council.

Many of the larger boroughs possess a separate commission of the peace. Under the Municipal Corporations Act, the mayor and ex-mayor are *ex officio* justices of the peace, and the other borough magistrates are appointed by commission from the crown. The town-council has no magisterial functions as such. In most boroughs the magistrates are unpaid, but in some of the larger boroughs a stipendiary has been appointed by the crown on the application of the town-council, his salary being paid out of the borough funds. A borough may also obtain the right by petition to the crown to hold a separate quarter-sessions, which involves the appointment of a salaried recorder, coroner, and clerk of the peace. This gives freedom from control of county justices, and from payment of county rate.

As regards the administrative functions of the corporation, the principal are to provide for the watching (by means of a force of borough constables) and the lighting of the borough, as prescribed by the Municipal Corporations Act, 1882; and to enforce the sanitary laws under the Public Health Acts, 1873 and 1875. In its capacity as sanitary authority, the town-council has power to regulate sewerage, burial-grounds, water and gas supply, common lodging-houses, baths, and other sanitary matters. The execution of the Elementary Education Acts has also been intrusted to the borough councils in certain cases where there is no school board; and by recent legislation, certain other functions have been assigned to them, such as the regulation of weights and measures, and the establishment of free libraries.

Expenses of Administration.—The expenses incurred by the council in the exercise of their functions are ordinarily defrayed out of the *Borough Fund*, supplemented where necessary by a *Borough Rate*. The borough fund was expressly defined by the Municipal Corporations Act, 1835, which declared that the rents and profits of all hereditaments, and the interest, dividends, and annual proceeds of all moneys, dues, chattels, and valuable securities belonging or payable to any body corporate named in conjunction with a borough in the schedules, or to any member or officer thereof in his corporate capacity, and every fine and penalty for every offence against this act (the application of which has not been already provided for), shall be paid to the treasurer of such borough; and all the moneys which he shall so receive shall be carried by him to the account of a fund to be called 'the Borough Fund;' and such fund, subject to certain payments and deductions, shall be applied towards the payment of the salary of the mayor, and of the recorder, police magistrate, town-clerk, treasurer, and other officers. (See 45 and 46 Viet. chap. 50, sects. 138-

144.) In a few favoured boroughs the borough fund is large enough to meet the whole costs of administration and to leave a surplus, which must be applied, not as of old in private bounties, but for the benefit of the inhabitants and improvement of the town. The borough rate, on the other hand, which has to be levied to a greater or less extent in most boroughs, is similar to the county rate. Authorised by the Municipal Corporations Act to be levied in all cases where there is a deficiency of borough fund, it is intended to meet the maintenance of the police force, borough jail, public baths and wash-houses, public libraries, parks and cemeteries, and lunatic asylums, together with 'general expenses.' These 'general expenses' include the expense of paving, lighting, sewerage, and all appropriate town improvements. The school rate is also included in the borough rate. Where parties consider themselves aggrieved by a borough rate, they may appeal to the recorder at the next quarter-sessions for the borough; or, if there be no recorder, to the next county quarter-sessions.

Besides boroughs proper under the Municipal Corporations Act, there are other organisations of a burghal character with administrative boards possessing many of the powers of town-councils. Such are the 'Local Government Districts,' of which there are a very large number, constituted under the Public Health and Local Government Acts, and the 'Improvement Act Districts,' constituted under various local acts. There are also certain semi-urban districts, constituted under the Lighting and Watching Act, 1833.

The position of the City of London among the urban communities of England is in nearly all respects unique, and will be explained under the article LONDON.

II. In Ireland, the term *Borough* is not much used as a designation for cities and towns, either in their parliamentary or municipal character. The history of burghal life in Ireland prior to this century, shows an absence of that free and vigorous life which was to be found in the sister-kingdoms. This is in large measure to be ascribed to the pernicious system of excluding Roman Catholics from municipal liberties and offices, and admitting non-resident freemen to take part in elections.

The Irish towns are partly corporate, partly governed by commissioners. The corporate towns, or boroughs proper, are regulated by the Irish Municipal Reform Act, 1840 (3 and 4 Viet. chap. 108). There are eleven such boroughs governed by a mayor, aldermen, and councillors. The number of members in a council varies from sixty in Dublin to twenty-one in Wexford. The aldermen and councillors are elected for three years. The qualification for a burgess elector is a house of £10 yearly value, residence within the borough, or occupancy for a defined period, and payment of rates. Councillors, on the other hand, must be qualified as electors, and must also be owners of a certain amount of real or personal property, or occupiers of a house of a certain value, the amount depending upon the size of the borough.

The municipal council administer the ordinary affairs of the borough, such as lighting, watching, cleansing, and all sanitary business; and they have power to levy rates for these purposes. In one or two boroughs the fiscal powers of the grand jury have been transferred to the town-council.

Besides the incorporated boroughs, there are a large number of towns in Ireland with an organisation and administrative functions similar to those of the incorporated boroughs. These towns have been constituted mainly under the Lighting and Cleaning Act of 1828 (9 Geo. IV. chap. 82), and the Towns Improvement Act of

1854 (17 and 18 Vict. chap. 103). One unincorporated municipality—viz. Carrickfergus—has been constituted under the above-mentioned Act of 1840. The governing body in these cases is composed of elected commissioners, whose numbers vary from twenty-one to nine. There are certain qualifications (occupation of premises of a certain value) required for electors and commissioners respectively. The commissioners have, as a rule, powers to carry out all ordinary municipal purposes, and can levy rates.

III. In Scotland, the word *burgh* corresponds to the English *borough*. There were originally three distinctive classes of burghs—viz. *burghs of barony*, *burghs of regality*, and *royal burghs*. The effect of the Reform Act, 1832, was to bring into existence a new class—what are called *parliamentary burghs*—i.e. towns or burghs not being royal burghs, but sending or contributing to send representatives to parliament, under the Act 2 and 3 Will. IV. chap. 65. Besides these, the necessities of modern urban life have created yet another class; for, by the General Police Act for Scotland, the word *burgh* was declared to mean also any 'populous place,' the boundaries of which are fixed by the act.

(1) **BURGHs OF BARONY** are corporations consisting of the inhabitants of determinate tracts of ground within the *Barony*, and municipally governed by magistrates and a council (or sometimes by magistrates alone), whose election is either dependent on the baron superior of the district, or vested in the inhabitants themselves. Sometimes their charter of incorporation gave them power to create subordinate corporations and crafts, as in royal burghs; but all exclusive privileges of trading in burghs are abolished by the 9 and 10 Vict. chap. 17. The magistrates (along with the council when there is one) have power to administer their corporate property (*common good*, as it is called), to elect their burgh-officers, and to make bye-laws. They may be (where the inhabitants so resolve) the local authority for executing the provisions of various statutes affecting urban interests—as, for instance, matters of police under the General Police Acts, 1850 and 1862; and sanitary matters under the Public Health Act, 1867. But where separate police commissioners have been elected for burghs of barony, separate from the burgh council, the administrative functions of the latter become merged in those of the former. A proportion of the land-tax is payable by burghs of barony.

(2) **BURGHs OF REGALITY** were burghs of barony, spiritual or temporal, enfranchised by crown charter, with regal or exclusive criminal jurisdiction within their own territories, and thence called *Regalities*. Some of these burghs of regality, especially those which were dependent on the greater bishops and abbots, were of high antiquity, and possessed jurisdiction and privilege of trade only distinguishable from those of royal burghs by being more circumscribed in their limits. Since the abolition of hereditary jurisdictions, by the Act 20 Geo. II. chap. 43, the distinction between burghs of regality and burghs of barony has ceased to be of any practical importance.

(3) **ROYAL BURGHs**.—A Royal burgh is a corporate body deriving its existence, constitution, and rights from a royal charter—such charter being either actual and express, or presumed to have existed, and by the accident of war and time to have perished. By a Scotch act passed in 1469, a constitution was given to royal burghs, by which the right of appointing their successors belonged to the old councils, the act also containing the singular provision, that when the new council was chosen, the members of it, *along with those of the old council*, should choose all the office-bearers of the

burgh, each craft or trade corporation being represented at the election by one of themselves. But this simple plan was not universally adopted, and the election gradually lost its former free and popular form—a close and exclusive proceeding being ultimately established in its place. This 'close system,' as it has been called, notwithstanding its repugnancy to the spirit of the times and modern ideas of public administration, continued in force until the year 1833, when an act of parliament was passed, the 3 and 4 Will. IV. chap. 76 (amended by the 4 and 5 Will. IV. chap. 87, and the 16 Vict. chap. 26), by which it was abolished, and an entirely new constitution given to royal burghs, with the exception of nine of them, which, on account of the smallness of their population, were left unchanged till the passing of the Municipal Elections Amendment Act (Scotland) in 1868.

At the union of England and Scotland there were seventy royal burghs, all of them except four (viz. Auchtermuchty, Earlsferry, Falkland, and Newburgh) returning members to the Scottish parliament. Two royal burghs (Rothesay and Peebles) were deprived of the burgh parliamentary franchise in 1832, and nine (Stranraer, New Galloway, Whithorn, Wigtown, North Berwick, Haddington, Dunbar, Jedburgh, and Lander) in 1885. One town—viz. Coatbridge—was created a municipal burgh with the municipal privileges of royal burghs by special act of parliament in 1885.

Under the Municipal Acts of 1833 and 1868 the following organisation has been provided for royal burghs. They are governed by corporations composed of magistrates and councillors elected by the citizens. The number of members of a town-council varies from fifty in Glasgow to six in Oban. The electors consist of the persons qualified to vote for a member of parliament under the Reform Acts of 1832 and 1868, and the persons possessing the qualifications which would be sufficient for the parliamentary franchise under the said Reform Acts in respect of premises situated within the municipal boundaries, when such boundaries extend beyond the parliamentary. The councillors are chosen from among the electors residing, or personally carrying on business, within the royalty; and formerly, where there was a body of burgesses in the burgh, each councillor, before his induction, required to be entered a burgess, but by an act passed in 1876, the right of burgess-ship is now practically extended to all resident ratepayers. By 44 and 45 Vict. chap. 13, sect. 2, women who are unmarried, and married women living separate from their husbands, were admitted to the municipal franchise, but they cannot be elected town-councillors. The electors of Edinburgh, Glasgow, Aberdeen, Dundee, Perth, and several other of the larger burghs, are divided into wards. At the election immediately succeeding the passing of the act, each ward elected six councillors; but as every year the third part of the council goes out of office in the order prescribed by the act, two councillors are now annually chosen by each ward, there being no bar, however, to the re-election of an outgoing councillor. It is now competent for burghs with a population above 5000 to be divided into wards for the purpose of municipal as well as parliamentary elections by resolution of a majority of two-thirds of the council to that effect. The electors in other burghs choose the whole council exactly as these wards do their proportion of it, and consequently elect each year a third part in place of that which has retired. Upon the third lawful day after the election succeeding the passing of the act, the councillors meet and choose, by a plurality of voices, a provost, bailies, treasurer, and other office-bearers, as existing in the council by the 'sett' or usage of the burgh. Vacancies taking place

during the year by death or resignation are supplied, *ad interim*, by the remaining members of the council, and the persons so elected by the councillors retire at the succeeding election. The rights of the guildry, trades, &c., to elect their own dean of guild, &c., are still preserved; but these officers are now no longer recognised as constituent members of the council, their functions being performed by a member of the council, elected by a majority of the councillors. In Aberdeen, Dundee, and Perth, however, the dean of guild, and in Edinburgh and Glasgow, the convener of trades and the dean of guild are, *ex officio*, members of council; and the electors in all the above-named burghs choose such a number of councillors as, together with these officers, makes up the proper number. No magistrate or councillor can be town-clerk. The magistrates and council possess the same powers of administration and jurisdiction as were enjoyed by the magistrates and town-council before the passing of the act; and none of them is responsible for the debts of the burgh, or the acts of his predecessors, otherwise than as a citizen or burgess. The existing council in all burghs royal must every year make up, on or before the 15th of October, a state of their affairs, to be kept in the town-clerk's or treasurer's office.

From an early period in Scottish history the royal burghs have been in use to consult together and take common action in matters concerning their welfare. Evidence of this is found so far back as the middle of the 12th century, when the court of the four burghs (Edinburgh, Berwick, Stirling, and Roxburgh) met under the presidency of the High Chamberlain of Scotland. This court was superseded in the 15th century by the meeting of representatives of all the royal burghs. This was called the *Convention of Royal Burghs*, and according to the Scottish Act, 1487, chap. 3, which organised it, the duties of the convention were to deal with 'the welfare of merchandise, the gude rule and statutes for the common profit of burrows, and to provide for remedie upon the skaith and injuries sustained within the burrows.' The convention still meets annually in Edinburgh, and though shorn of much of its previous influence, it still shows a considerable amount of vitality, particularly in furthering legislative measures which may be useful to trade. The convention is recognised as a corporation. The proportion of the land-tax payable by royal burghs is also adjusted by the convention. By an act passed in 1879, parliamentary burghs (see below) are enabled to send representatives to the convention.

(4) **PARLIAMENTARY BURGHS.**—For municipal purposes these burghs stand practically in the same position as royal burghs, being regulated by the Municipal Reform Acts of 1833 and 1868. Among parliamentary burghs are Paisley, Greenock, Leith, Kilmarnock, Falkirk, Hamilton, Peterhead, &c. The boundaries of parliamentary burghs, being fixed for the first time by the Reform Act of 1832, were adopted for municipal purposes. A number of parliamentary burghs were previously burghs of barony and regality, their character as the latter being generally merged in the former.

(5) **POLICE BURGHS.**—Prior to 1833 it was necessary for towns desiring to make provision for police and sanitary matters to obtain special acts of parliament for the purpose. In this year the first General Police Act was passed, laying down certain general provisions for watching, lighting, and cleansing, which might be adopted by a royal, regality, or barony burgh. Another general act was passed in 1850, and the existing General Police Act in 1862 (25 and 26 Vict. chap. 101), which supersedes the earlier ones. In this last-

named act 'burgh' is defined to mean all burghs and populous places whose boundaries have been fixed; and it is provided that the sheriff may fix the boundaries and so constitute a burgh in this sense, for purposes of improvement and police, at the instance of seven or more householders.

The local authority in police burghs is the police commissioners. Their number varies from twelve to six, and in the case of towns divided into wards the number must be so arranged that each ward be represented by three members. The commissioners are elected by occupiers of premises (including females who are unmarried or living separate from their husbands) of £4 value who have paid rates. The same qualification is required for a commissioner as for an elector, but a female cannot be elected. The commissioners hold office for three years, retiring annually by thirds, or as nearly as may be. They choose magistrates, one senior or chief, and two junior magistrates. The principal administrative functions of the commissioners are watching, paving, cleansing, lighting, and improving the burgh. The expenses are defrayed by a rate called 'Police Assessment,' levied upon occupiers of lands within the burgh.

By the Local Government Act of 1888 a system of administration resembling that of boroughs was introduced into counties; and certain towns were constituted 'county boroughs.' The election of eleven peers as mayors in England in 1895 was a somewhat new (and successful) experiment in municipal management.

BURGH LAWS (*Leges Burgorum*), in Scottish legal history, was the name given to a collection of ancient laws relative to burghs, which claim to have been enacted in the reign of King David I. in the 12th century. See REGIAM MAJESTATEM.

In the United States of America and in the British colonies, cities and towns have grown up and have been organised in accordance with (speaking generally) the most enlightened ideas of modern civic life. According to the opinion of American constitutional lawyers, the city or borough organisation is regarded as a grant from the state for the purpose of carrying out minor matters of civil government in urban communities. It has attached to it the general powers inherent in all corporate bodies, with powers to make bye-laws.

See the articles **BURGESS**, **CITY**, **CORPORATION**, **COUNTY**, **EDUCATION**, **GUILDS**, **LICENSING LAWS**, **LIVERY**, **LOCAL GOVERNMENT**, **MAYOR**, **MUNICIPALITY**, **PARLIAMENT**, **PROVOST**, and **TOWNSHIP**; Gneist, *Self-government* (3d ed. 1871) and other works; the Cobden Club Essays on Local Government and Taxation (1875 and 1882); Rogers, *Registration, Parliamentary and Municipal* (new ed. by Carter, 1887; books on the law of municipal corporations by Arnold, Chambers, Lely, Owen, Rawlinson, Saunders, Vine, &c.; Mrs Green, *Town Life in the 15th Century* (1894); Albert Shaw, *Municipal Government in Great Britain* (1895); F. J. Goodnow, *Municipal Home-Rule* (1895); and F. Dolman, *Municipalities at Work* (1895). For information regarding the history of boroughs, see Maine's *Early Institutions* and Stubbs' *Constitutional History*.

Boroughbridge, a small market-town of Yorkshire, on the Ure, 21½ miles NW. of York. Edward II., in 1322, defeated the Earl of Lancaster here. Hard by are three great monoliths, called the 'Devil's Arrows,' 16 to 22 feet high. Pop. 966.

Borough English is a custom that prevails in some ancient boroughs in England, according to which the youngest son inherits the heritable property within borough in preference to his elder brothers. The origin of this custom has not been satisfactorily determined. One reason assigned for it is, that the youngest son, on account of his tender age, is not so capable as his elder brothers

to maintain himself. Another explanation is that it was the result of the so-called *fas prima noctis*—a barbarous feudal custom by which a feudal overlord is said to have obtained the right of concubinage with the wife of his vassal on the night of her wedding; but the existence of this custom is more than doubtful. Maine suggested that it was derived from the *Patria Potestas* (q.v.); and Elton that it is a survival from pre-Celtic, pre-Aryan usages. A posthumous son is entitled to this privilege, and dispossesses his elder brother. The right of representation also exists with reference to it, for should the youngest son die in his father's lifetime leaving a daughter, she will inherit the property. This custom obtains in parts of Kent, Surrey, Sussex, Middlesex, Somerset, and more rarely elsewhere. See GAVELKIND, INHERITANCE, PRIMOGENITURE; and Elton's *Origins of English History* (1882).

Borovitchi, a town of Russia, on the river Msta, 98 miles E. of Novgorod. Pop. 10,912.

Borovsk, a town of Russia, 49 miles NNE. of Kaluga. In its vicinity is a convent founded in 1477, and formerly one of the richest in the empire. Pop. 10,191.

Borromeo's Islands, a group of four small islands on the west side of Lago Maggiore, Northern Italy. They are situated in the western arm of the lake, and are named after the ancient family of Borromeo. Vitaliano, Count Borromeo, about 1671, caused soil to be carried to them, built terraces, and converted them into beautiful gardens. The two most celebrated are *Isola Bella* and *Isola Madre*. On the west side of *Isola Bella*, which rises above the water in ten successive terraces, stands a palace of the Borromeo family, containing many admirable paintings and other works of art. *Isola Madre* is laid out in the same terraced style, and is crowned by a now dilapidated palace. The *Isola de' Pescatori* is inhabited by about 200 fishermen. Jean Paul Richter has described the place in his *Titan*.

Borromeo, CARLO, ST., a great churchman and saint of the 16th century, was born 2d October 1538, at his father's castle of Arona, on the Lago Maggiore. He studied law at Pavia, took the degree of doctor in 1559, and next year was appointed in quick succession by his uncle, the new Pope Pius IV. (formerly Cardinal de' Medici), apostolic protonotary, cardinal, and Archbishop of Milan. As a counsellor of the pope the young cardinal showed wisdom beyond his years, did much to bring the Council of Trent to a successful conclusion, and had the principal part in drawing up the famous *Catechismus Romanus*. The saintly simplicity of his manners, his ardent piety, and his self-forgetful devotion to duty, united to make him the ideal bishop, and have kept his memory green until the present day. But his own severe morality and his determined efforts to maintain ecclesiastical discipline drew upon him the hostility of the monastic orders, and in 1569 a wretch of the order of the Umiliati actually shot at the archbishop as he knelt at prayer in his chapel. Borromeo devoted the greater part of his revenues to the relief of the poor, and during the famine of 1570, and the plague at Milan in 1576, showed such energetic benevolence and fearless devotion as to make his name a proverb throughout Christendom. With a view to provide well-qualified priests for Switzerland, he founded in 1570 the Helvetic College at Milan; and he brought about an alliance of the seven Catholic cantons—the *Golden Borromean League*—for the united defence of the faith. Exhausted by his labours and his austerities, he died 4th November 1584. He was canonised by Pope Paul V. in 1610. His theological works

were published at Milan in 1747, in 5 vols. folio. On the western bank of the Lago Maggiore, in the neighbourhood of his birthplace, is a colossal bronze statue of him. His Life has been written by Sailer, Dieringer, Sala, Abbé Sylvain (1884), and Giussano (Eng. trans. with preface by Cardinal Manning, 1884).—His brother's son, Count Frederico Borromeo, born 1562, was also a cardinal, and from 1595 to 1631 Archbishop of Milan, where he founded the Ambrosian Library.

Borrow, GEORGE HENRY, was born at East Dereham, Norfolk, 5th July 1803. His father, a captain of militia, during the war moved about with his regiment to Scotland, Ireland, and many parts of England, then settled at Norwich, where young Borrow attended the grammar-school (1816–18), and for the next five years was articled to a firm of solicitors. Already he deserved his Gypsy title *Lavengro* ('word-master'), having picked up a knowledge of Irish, French, German and Danish (these two under 'Taylor of Norwich'), Welsh, Latin, Greek, even of Romany, the language of that strange (Gypsy) race of which he was almost an adopted member. On his father's death in 1824 he came up to London to seek his fortune, and fared ill as hack-writer to Sir Richard Phillips the publisher. Anon he wandered Gypsy-wise through England, and, on his wanderings, was all but poisoned by a Romany beldame, fought and vanquished the Flaming Timman, with Isopel Berners tented in Mumper's Dingle, and met with other moving accidents (are they not chronicled in his own book, *Lavengro*?). Next—and here facts and dates are again realities, without any suspicion of fancy—as agent of the Bible Society he visited St Petersburg (1833–35), and Portugal, Spain, Morocco (1835–39). In 1840 he married a well-to-do widow, and settled down on a small estate of hers at Oulton, near Lowestoft, where, after travels in South-eastern Europe (1844), a tour in Wales (1854), and a residence of some years in London, he ended his days, 26th July 1881. The chief of his fourteen published works are: *The Zincali, or Gypsies of Spain* (1840); *The Bible in Spain* (1843); *Lavengro* (1851); its sequel *The Romany Rye* (1857); *Wild Wales* (1862); and *Romano Laro-Lil, or Word-book of the English-Gypsy Language* (1874)—six works, of which the first three increased, as the last three fell off, in vigour and interest. All but the first and last are autobiographical; and even the *Zincali* and *Laro-Lil* are full of the author's strong individuality. He has been likened to Cervantes, Defoe, Lesage; 'a Lesage in water-colours' is how he described himself. In truth, all three were in some ways his literary progenitors: none the less he is always original, always George Borrow, with his love of horseflesh, boxing, strong ale, and open-air life, his hatred of gentility, priesthood, cant of any kind. His rare mastery of good strong English, his rarer power of depicting mankind and nature, are often marred by studied mannerisms, transparent mystifications, unreasoning crotchets, Manfred-like posings. Not that here lay his chief offending. He was too English for the squeamish age that preceded the gospel of 'Muscular Christianity'; and no writer so well worth reading is even nowadays so little read. In Mr Watts-Dunton's 'Reminiscences of George Borrow' (*Athenaeum*, September 3, 10, 1881) we get a splendid picture of the man—his mighty figure, frank and childlike gaze, his fine East Anglian accent, his love of nature and love of adventure, his reverence and unswerving belief in God's beneficence, his talk—fresh, racy, whimsical—of all the wondrous things he had seen and heard in his wondrous life. 'No man's writing can take you into the country as Borrow's can; it makes you feel the sunshine, see the meadows, smell the flowers, hear

the skylark sing and the grasshopper chirp. Who else can do it? I know of none.

See also Watts-Dunton's introduction to Lavengro (1893), Dutt's *Borrow in East Anglia* (1896), and the Life by Prof. Knapp (2 vols. 1899).

Borrowdale, a beautiful valley of West Cumberland, ascending from the head of Derwent-water towards the Honister Pass. Its rich and famous plumbago mine was exhausted in 1850 (see BLACK LEAD).

Borrowing. See LOAN, INTEREST, USURY.

Borrowing Days, the last three days of March (old style), supposed in Scotch folklore to have been borrowed by March from April, and to be especially stormy. In Cheshire, the first eleven days of May are called 'borrowed days,' because in old style they belong to April. See Brand's *Popular Antiquities* (Ellis's ed. vol. i.).

Borrowstownness. See BO'NESS.

Borsad, a town in the northern division of the province of Bombay, 24 miles NE. of the port of Cambay. Pop. 12,228.

Borsippa. See BABEL.

Bort, diamond-dust. See DIAMOND.

Borwick Castle, a splendid ruined peel-tower, 13½ miles SSE. of Edinburgh. Founded in 1430, it is 110 feet high, and measures 74 by 69 feet, but has a long recess on the west side which gives it the shape of a Greek II. In June 1567 Queen Mary and Bothwell spent four days here. The historian Robertson was born at the manse hard by. Crichton Castle, whose beautiful courtyard is finely described in *Mitruion*, stands 1½ miles to the east.

Bory de Saint Vincent, JEAN BAPTISTE, a French traveller and naturalist, was born at Agen in 1780. In 1798 he explored Bourbon and other islands. He served in the army at Ulm and Austerlitz, on Soult's staff in Spain, and as a colonel at Waterloo; in 1816 he had to retire to Belgium. He returned to France in 1820, wrote for Liberal journals, and for Courtin's *Encyclopédie*, &c. In 1829 he headed a scientific expedition to the Morea, and in 1839 to Algeria. He died 22d December 1846. His most important productions were: *Essai sur les Iles Fortunées* (1803); *Voyage dans les Iles d'Afrique* (1804); *Voyage Soudrain* (an account of the Maestricht chalk-quarries, 1823); *L'Homme, Essai Zoologique sur le Genre Humain* (1827); *Resumé de la Géographie de la Péninsule* (1838).

Borzoï. See WOLF-HOUND.

Bosa, a cathedral city on the west coast of Sardinia, 85 miles NNW. of Cagliari, with a small port and some trade. Pop. 6696.

Boscan-Almogaver, JUAN, a Spanish poet, born about 1495 at Barcelona, of an ancient noble family, came to Granada to the court of Charles V. in 1519. The education of the celebrated Duke of Alba was afterwards intrusted to him. He died in 1542. He was the first to make use of Italian measures in Spanish verse, and thus became the creator of the Spanish sonnet. His poems, which are still esteemed, were first published in 1543; the best edition appeared at Madrid in 1875.

Boscawen, EDWARD, an eminent English admiral, third son of Viscount Falmouth, was born 19th August 1711, and highly distinguished himself at the taking of Puerto Bello, and at the siege of Carthage in 1741. Successively in command of the *Prince Frederick* and the *Dreadnought*, in the latter in April 1744 he captured the French ship *Médée*, with 800 prisoners. He had an important share in the victory off Cape Finisterre (3d May

1747), where he was wounded in the shoulder; and six months after receiving the command of the East Indian expedition, he displayed high military skill in conducting the retreat from Pondicherry. He returned in 1750, and in the following year became a lord of the Admiralty. In 1755 he was again afloat, and intercepted the French fleet off Newfoundland, capturing two 64-gun ships and 1500 men. In 1757 he was appointed second in command of the main fleet under Hawke, and in 1758, now admiral of the blue, he was appointed commander-in-chief of the successful expedition against Cape Breton. Boscawen crowned his career by his signal victory over the French Tonlon fleet in the Bay of Lagos, 18th August 1759. On his return home, he received the thanks of parliament, a pension of £3000 a year, a seat in the Privy-council, and the command of the marines. In the following summer he commanded the fleet in the Bay of Quiberon. He died 10th January 1761. Boscawen was notable for his ready and decisive courage; amongst the sailors he was known as 'Old Dreadnought.'

Bos'cobel, on the eastern verge of the county of Shropshire, 7 miles E. of Shifhall, and 37 N. of Worcester, was, after the defeat of Worcester (3d September 1651), for two days the hiding-place of Charles II. The 'Royal Oak' in which, with Major Careless, he concealed himself for more than twenty-four hours, is represented by a tree grown from one of its acorns; but Boscobel House, then occupied by the Penderel family, still stands, a half-timbered dwelling. See Thomas Blount's *Boscobel* (1660-81); ed. by J. Hughes (1857); by C. G. Thomas (1894).

Bosco Reale, a village of South Italy, at the south base of Mount Vesuvius, 10 miles ESE. of Naples. Pop. 5190.

Boscovich, ROGER JOSEPH, a celebrated mathematician and astronomer, was born at Ragusa in 1711, and at an early age entered the order of the Jesuits. Before the completion of his course of studies in Rome, he was appointed teacher of Mathematics and Philosophy in the *Collegium Romanum* there; his reputation had been previously established by a solution of the problem to find the sun's equator and fix the time of his rotation by observing the spots. The pope gave him a commission to measure a degree of the meridian in the States of the Church. He was sent to London in 1760 in defence of the interests of Ragusa. In 1764 he was appointed to a professorship in Pavia, and subsequently at Milan. After the dissolution of his order in 1773, he went to Paris, received a pension from the king, and was appointed director of optics to the navy. Boscovich afterwards returned to Milan, but fell into a depression of spirits, which at last grew into complete insanity. He died in 1787. His works include dissertations on a great variety of important questions in mathematical and physical science, and were published collectively under the title *Opera Pertinentia ad Opticam et Astronomiam* (5 vols. 1785). His name is connected with a molecular theory of physics, first published in his *Theoria Philosophicæ Naturalis* (Vienna, 1758). He was also a poet, and his Latin poem, *De Solis ac Lunæ Defectibus* (1764), was dedicated to the London Royal Society, of which he had been elected a member.

Bosio, FRANÇOIS JOSEPH, BARON, an eminent sculptor, born March 19, 1769, at Monaco; studied first at Paris, next in Italy, and first became famous by the figures which, at the request of Napoleon, he executed for the column in the Place Vendôme. Louis XVIII. and Charles X. also patronised Bosio,

the former made him royal sculptor, the latter, a baron. He died director of the Academy of Fine Arts in Paris, July 29, 1845.

Bosjesman. See BUSHMEN.

Bosna-Serai, or SARAJEVO, capital of Bosnia, stands on the hill-slopes that overlook the Bosna River (3 miles distant), 166 miles SW. by rail of Bosna-Brod, on the Danube, and 100 miles E. by rail (1891) of Metkovich, a port near the mouth of the Narenta in the Adriatic. The citadel and the minarets of 100 mosques, the crowded 'charsia' or bazaar, and the steep and narrow streets climbing the hillsides amidst gardens, represent the ancient Moslem town; the wide streets on the plain near the railway station, traversed by tramways and lit with the electric light, the Roman Catholic cathedral, and the Bosnian museum reflect the swift progress that has taken place since the Austrian occupation in 1878. The Bogova-Jamia mosque dates from 1506; the Greek cathedral is a large building; and the Moslem college (1890) is in Oriental style. The town has considerable trade, and manufactures tobacco, cigars, and cigarettes; the Hungarian government has revived, in a large factory, the ancient Bosnian art of inlaying gold and silver in copper and wood. Pop. 30,000, mostly Bosnians by race, and more than half Mohammedans, with 5000 Greek Catholics, and nearly as many Roman Catholics, and 3000 Jews.

Bosnia and Herzegovina, a province lying between Dalmatia and Slavonia, which has made very rapid progress in prosperity since the Berlin treaty of 1878 put it, till then Turkish, under the administration of Austria-Hungary. Although not formally incorporated by treaty, these provinces form virtually a part of the empire-monarchy. With the sanjak of Novi-Bazar, occupied but not administered by Austria-Hungary, the area is nearly half that of England. Bosnia, the most beautiful of the Balkan provinces, reminds one of Styria or the Tyrol in its rugged mountainous character, its dense forests, and in the picturesqueness of its valleys. The Dinaric Alps, here attaining a maximum altitude of 7663 feet, form the water-parting between the Adriatic and Danube basins; and four rivers—the Unna, the Vrbas, the Bosna (from which the province takes its name), and the Drina—flow northwards to their confluence with the Save. Herzegovina, on the other hand, is a bare, rugged, ill-watered country of limestone mountain masses, overstrewn with cyclopean rocks; its few valleys are exposed in summer to broiling heat.

Unlike Slavonia and Hungary, Bosnia offers no advantages for the growth of cereals; but, as in Switzerland and the Tyrol, flocks and herds may be reared with profit. The commerce of Bosnia is almost exclusively in the hands of the Jews, the majority of whom reside in Sarajevo or Bosna-Serai, the capital. With the exception of the Jews, Tsigans (Gypsies), a few Bulgarians and Albanians, and some Osmanli Turks, who live in the larger towns of Bosnia, all the inhabitants of the Illyrian Alps are Slavs, and in Herzegovina their characteristics are most strongly marked. The Bosnians themselves, though united by race, are divided by religion, Mussulman against Christian, Greek-Orthodox against Roman Catholic. Hence, in spite of every natural advantage, they were, unlike their Serbian brethren, unable to emancipate themselves from the Turkish yoke. Although they form little over a third of the population, the Mussulmans possess more than their share of landed property.

The superficial area in square miles of Bosnia is about 16,142; of Herzegovina, 3515; and of Novi-Bazar, 3522. According to the census of 1885

the population of Bosnia and Herzegovina was 1,336,091 (Mohammedans, 492,710; Greek-Orthodox, 571,250; Roman Catholics, 265,788; Jews, 5805); in 1890, 1,505,000. Novi-Bazar has a population of 153,000. *Herzegovina*, Slav for 'duchy,' is formed from the German *Herzog*.

History.—Bosnia, in ancient times a part successively of Illyria, Pannonia, and Dalmatia, was during the great migrations occupied by Slavs or Slavonised Illyrians, at first dependent on Hungary; but it became a kingdom in 1376, under Tivartko, a native prince. Occupied by the Turks in 1401, it was annexed in 1463, but not recognised by Europe as a Turkish province till 1699. Extortionate taxation caused a rebellion of the Christians in 1849, suppressed by Omar Pasha; but a more determined rising in 1875, which the Turks failed to put down, led to the occupation of the province by the Austro-Hungarians, which the Moslem population opposed in a fierce but unavailing struggle. The treaty of Berlin formally intrusted the administration to Austria-Hungary. Since 1880 extraordinary progress has been made in roads, railways, finance, and commerce. See A. Evans, *Through Bosnia and Herzegovina on Foot* (1876); Strauss, *Bosnien* (1884); Laveleye, *The Balkan Peninsula* (trans. 1887); and Asbóth, *Bosnia and Herzegovina* (trans. 1889).

Bosporus (also BOPHORUS, Latinised forms of a Greek word meaning 'ox-ford'), the ancient name of the channel which separates Europe from Asia, and connects the Black Sea (*Euxine*) with the Sea of Marmora (*Propontis*). It was so called, according to the legend, from Io, who swam across in the form of a cow. Afterwards, as the same name was bestowed upon other straits, this was designated the *Thracian Bosporus*. Both its south and north entrances have light-houses on either side. Its shores are elevated, and throughout its length the strait has on either side seven bays or gulfs, with corresponding promontories on the opposite side. One of these gulfs forms the harbour of Constantinople, or, as it is often called, the Golden Horn. Across the Golden Horn is Pera, and opposite the imperial city, on the other side of the Bosporus, is Scutari. The length of the Bosporus is about 17 miles, with a breadth of from little more than a third of a mile to two miles, and its average depth is about 30 fathoms. Both sides look highly picturesque from the deck of the steamers plying up and down the straits, being richly dotted with cypresses, laurels, and ancient plane-trees, and covered with palaces, kiosks, villages, villas, and gardens. At the middle of this strait, where it is about 2800 feet in breadth, Darius made his bridge of boats when he marched against the Scythians. The Bosporus has long been under Turkish control, and repeated European conferences, including that of Berlin in 1878, have confirmed the stipulation of the treaty made in 1841, that no ship of war belonging to any nation but Turkey shall pass through it without the consent of the Ottoman authorities. For map, see CONSTANTINOPLE.

The name of CIMMERIAN BOSPORUS was given by the ancients to the Strait of Kaffa (q.v.), also called the Strait of Yenikalé or of Theodosia. The country on both sides of the Cimmerian Bosporus formed, about 500 B.C., a kingdom which grew till it embraced the whole Crimea, and of which the capital was *Panticapæum*. Many of its kings were in close alliance with the Athenians, but it at length became tributary to the Scythians.

Bosquet. PIERRE FRANÇOIS JOSEPH, French marshal, born 8th November 1810, at Mont de Marsan, in Landes; entered in 1834 the Algerian army, and reached the rank of general of brigade

in 1848. In the Crimean war, he contributed greatly to the victories of Alma and Inkermann, and took a leading part in the capture of the Malakoff, where he was severely wounded. Made senator and field-marshal in 1856, he died 5th February 1861.

Boss, in Architecture, a raised ornament, covering the intersections of the ribs of ceilings. They

Boss.—From Notre-dame la Riche, Tours.

are more frequently seen in vaulted roofs, as in the aisles of a church, but occur also where the ceiling is flat. In early Norman work there are generally no bosses, and they become richer and more frequent as we advance towards the Decorated and Perpendicular styles. In the Decorated style the boss usually consists of foliage, sometimes combined with animals, heads, and the like. Coats-of-arms, charged with armorial bearings, came then also to be used for this purpose, though they were more frequent in the Perpendicular.—The boss of a bit is the ornament with which a bridle-bit terminates at each end. It was borne in the arms of the corporation of Lorimers. See LORIMER.

Boss, a modified form of the Dutch *baas*, 'master,' is used in the United States for an employer of labour, or a local political chief; and in Britain is a slang word, or is employed humorously. To 'boss' is to play the master.

Bossuet, JACQUES BENIGNE, who ranks with Massillon as the greatest of French pulpit orators, was born at Dijon on the 27th September 1627. His family belonged to the middle class. He was educated in the Jesuits' School in Dijon, and at the Collège de Navarre in Paris. He received a canonry at Metz in 1652, and soon afterwards earned distinction as a controversialist by a reply to a work of the Protestant divine, Paul Ferri. In 1661 he preached for the first time in the chapel of the Louvre before Louis XIV., who was so impressed by the discourse, that he wrote to Bossuet's father congratulating him upon having such a son. Bossuet remained at Paris until 1669. His reputation as an orator spread over France, and he became the recognised chief of the devout party at court. After holding for a short time the bishopric of Condom, he was appointed tutor to the Dauphin, for whose benefit he is said to have written his *Discours sur l'Histoire Universelle* (1679). In 1680 he was elected to the academy, and in 1681 he received the bishopric of Meaux. He took a leading part in the Gallican controversy. His *Exposition de la Doctrine de l'Eglise Catholique sur les Matières de Controverse*—in which he advocated the royal as opposed to the papal claims—was adopted by the assembly of the French clergy held in 1682. He was less fortunate in his controversy with Fénelon, whose mysticism he regarded as heretical, and whom he attacked with an excessive violence, in strong contrast to the quiet and telling irony of his adversary's reply. The king, however, and ultimately the pope, supported Bossuet. He was made a member of the Council of State in 1697,

and first almoner to the Duchess of Burgundy in 1698. He died at Paris on the 16th April 1704. Bossuet's character is not an attractive one. He never protested against the king's licentiousness, oppressions, and unjust wars. As a preacher, he had neither the outspoken courage of Bourdaloue nor the persuasive gift of Massillon. His greatest works are the *Histoire Universelle*, regarded by many as the first attempt at a philosophy of history, and the *Oraisons Funèbres*, discourses on the death of the two Henriettas of England, of Condé, of Turenne, and of the Princess Palatine. Their chief characteristics are the splendour of the diction and the sustained flight of the rhetoric. While their author cannot be classed among great original thinkers, he is not a mere weaver of eloquent words. Intense religious conviction and deep knowledge of human nature give fervour and weight to his imposing sentences. As a controversialist, he combines, when at his best, the energy of enthusiasm with great dialectic ability; grasping his subject firmly, and showing remarkable wealth and felicity of allusion and metaphor. His chief controversial work is the *Histoire des Variations des Eglises Protestantes* (1688). Bossuet was also the author of *Maximes sur la Comédie*; *Conférence avec le Ministre Claude* (1678); *Négociations avec Leibnitz* (1691); *De l'Etat Présent de l'Eglise*; *Sur la Morale Relâchée*; *Mémoires présentés à Louis XIV.* (1700); *Politique Tirée de Sainte Ecriture*, in which he upholds the divine rights of kings, and which was published in 1709. The best edition of Bossuet's works is the Benedictine (Versailles, 1815-19). See his Life by Réaume (3 vols. Paris, 1870), and the *Mémoires et Journal* of the Abbé Leduc, Bossuet's secretary.—JACQUES BOSSUET, nephew of the above, was born in 1644. He became Bishop of Troyes, where he died, 12th July 1743. He left a voluminous correspondence, dealing mainly with the controversy between his uncle and Fénelon.

Bossut, CHARLES, mathematician, born at Tartaras, near Lyons, 11th August 1730, was furthered in his early studies by Clairaut and D'Alembert, and was, from 1752 till the Revolution, professor at Mézières, and under the empire in the Polytechnic Schools at Paris, where he died, 14th January 1814. In the compulsory retirement that followed the Revolution he wrote his famous *Essai sur l'Histoire Générale des Mathématiques*. He edited Pascal's works (5 vols. 1779).

Bostan' (EL), 'the Garden,' a town of Asiatic Turkey, situated in a plain on the Sihun, on the north side of Mount Taurus, 40 miles NW. of Marash. Pop. 8500.

Boston, a parliamentary and municipal borough and seaport in Lincolnshire, on both sides of the Witham, 30 miles SE. of Lincoln, and 107 miles NE. of London, by rail. Its name is a contraction of 'Botolph's town,' and it is commonly supposed to occupy the site of the Benedictine abbey founded on the Witham by St Botolph in 654, and destroyed in 870 by the Danes. Under the Normans, Boston became a place of importance, and in 1204 it paid the largest dues (£780) of any English port but London (£836). In the reign of Edward III. many foreign traders settled, and the merchants of the Hanseatic League established a guild in Boston. After their departure, the town declined, and the suppression of the monasteries by Henry VIII. further injured it; but his grant of a charter of incorporation, and Mary's subsequent grant of extensive lands, partly compensated for this. The modern town consists chiefly of four good streets, two on either side of the river, here crossed by a handsome bridge. The parish church of St Botolph measures 283 by 99 feet, and is one of the largest without transepts

in England. The tower is 263 feet high: it is in the Perpendicular style of architecture, and terminates in an octagonal lantern, doubtless intended

St Botolph's Church, Boston.

for a lighthouse by land and by sea, as well as a campanile, and by all the district, as seen rising above everything for miles around, is known as 'The Stump.' The founder's chapel is in the Early Decorated style of Edward II. (1307), and the nave, aisles, and the western part of the chancel are of the Late Decorated, Edward III. In 1843 the restoration of the church was commenced, the works continuing ten years, and over £10,000 being expended. A chapel to the memory of the Rev. Thomas Cotton, at one time vicar of Boston, was erected at the expense of the inhabitants of the daughter-city of Boston in America. A promenade by the river is tastefully laid out, with a people's park, public gardens, and recreation ground adjoining. Boston has also a free grammar, charity, national, and other schools, a guildhall, covered markets for fish, fowls, butter and eggs, a working-men's college, and school of art. The clearing of the river of silt, the formation of a new channel in 1881, and the opening of a new dock in 1884, have greatly promoted the trade of Boston. Ships of 2000 tons can reach the heart of the town; and the number of foreign vessels entering the port rose from 17 in 1884 to 170 in 1887. The chief exports are coal, machinery, corn, and wool; and the imports consist of timber, maize, cotton-seed, and general merchandise. The river and canals furnish communication with Lincoln and several other towns. Boston is a great market for cattle and sheep, and has manufactures of canvas, sail-cloth, ropes, sacking, beer, iron, brass, leather, bricks, whiting, and hats, with some shipbuilding. Fox the martyrologist, and Herbert Ingram, founder of the *Illustrated London News*, to whom a statue was erected in 1862, were natives of Boston. Since the Distribution of Seats Act (1885) Boston returns only one member to parliament. Pop. of municipal borough (1851) 14,733; of parliamentary, 17,518; (1891) 14,593 and 18,711.

Boston, the capital of Massachusetts, and one of the chief cities of the United States, is situated on an inlet of Massachusetts Bay, called Boston Harbour, at the mouth of the Charles and Mystic rivers, in 42° 21' 27" N. lat., 71° 3' 30" W. long., and 234 miles NE. of New York by rail.

Boston possesses an excellent harbour, protected by several forts, and covering 75 sq. m., with a minimum depth of 23 feet at low tide, and is in all respects favourably situated both for foreign commerce and coasting-trade; the harbour has four fine lighthouses, and is dotted with more than fifty islands, on some of which hospitals have been built. Eight lines of railway, controlling over 2000 miles of road, converge at this city, in the outskirts of which the Junction Railroad connects most of the lines with one another; and ten lines of ocean-steamer ply regularly between this and British and other foreign ports. The chief imports are sugar, wool, hides (for its large boot and shoe manufactories), chemicals, flax, and cotton goods; the principal exports, meat and dairy products, cattle, bread-stuffs, cotton, and tobacco. The value of imports for the fiscal year, ending June 30, 1887, was \$61,018,330, and of exports \$59,001,505; 2647 vessels in the foreign trade, of 1,258,524 tons, entered the port in 1886, 1949 of them, with a tonnage of 892,897, being British. The Charles-town government navy yard is within the present limits of Boston, and the city, besides being the seat of many varied local manufactories, is the headquarters of heavy railroad, mining, and insurance interests, the active operations of which are carried on in all sections of the United States. It has 60 National Banks, with an aggregate capital of about \$60,000,000, 13 savings-banks, and a board of trade.

Boston is exposed to east winds, and pulmonary complaints are very prevalent; but otherwise its

Map of Boston and Vicinity.

climate is healthy. It is one of the best built cities in the United States, prominent among its specimens of elaborate architecture being Trinity Church and the Roman Catholic cathedral, the former erected at a cost of \$750,000, and said to be the finest church in New England. The streets in the older portion of the city, once singularly irregular in their course, have been very generally straightened, at great expense, and most of the principal ones are traversed by tramways,

which extend for many miles, connecting with suburban towns. Nevertheless, the 'North End' still preserves something of the appearance that characterised the town in colonial times. The older buildings include the State-house (1795), with a conspicuous gilded dome, and fronting on the well-kept Common, the Old State-house (1712), Christ Church (1723), Faneuil Hall (1743), afterwards termed 'The Cradle of Liberty,' and King's Chapel (1754). Among later public buildings and institutions may be noted Tremont Temple, the headquarters of New England Baptists, containing an audience-hall, with seats for 2600, and a fine organ; the Free Public Library, with a half-million bound volumes, accessible to all comers; the government Post-office and Sub-treasury building, of granite, erected at a cost of about \$6,000,000; the Lowell Institute, for the support of free public lectures; the Massachusetts, City, and several minor hospitals; a large number of homes, asylums, and orphanages, under the charge of the various religious denominations; and city dispensaries and institutions for the insane, the blind, &c.

Boston has about 225 churches, of which 34 are Congregationalist, 31 Roman Catholic, 27 Baptist, 30 Methodist, 26 Unitarian, and 26 Episcopalian. Its elaborate system of public schools embraces high, normal, and Latin schools, over 50 grammar schools, and more than 400 schools of minor grade, with a staff of some 1400 teachers. The average attendance of pupils is over 60,000, and about \$2,000,000 is expended annually for school purposes. Among the higher institutions of learning are the Boston College (Catholic); the Boston University (Methodist), for the education of both sexes; schools of technology and industrial science; two conservatories of music, both of high repute; schools of law and divinity; and the Massachusetts Medical College, connected with Harvard University, which, though located in the adjacent city of Cambridge, is virtually a Boston institution.

The 'Hub of the Universe' has long been noted for the interest taken by its citizens in literature, science, and art. The city possesses some 250 literary, musical, and kindred associations, many of them incorporated and endowed, besides a number of social and political clubs. The number of newspapers and periodicals here published is about 250, of which 9 are issued daily, and the remainder weekly, monthly, or quarterly.

Originally founded in 1630 upon a peninsula known as Shawmut, it was first called Trimountain, from the three hills which were then a marked feature of the territory, and was afterwards officially named Boston, after Boston in Lincolnshire, the native place of some of the principal colonists. This tract, purchased from the original settler, William Blaxton (or Blackstone), for £30, comprised 783 acres; but by successive additions the territory of the city has been increased, until, in 1888, it covered 23,661 acres, or nearly 37 sq. m. Among these additions are comprised the city of Roxbury, annexed in 1867; Dorchester, annexed in 1869; and Charlestown, West Roxbury, and Brighton, annexed in 1873. Charlestown had in 1870 a population of 28,000. Large tracts of ground

also have been reclaimed from the harbour and its branches, and sixteen bridges, besides the railway-

Trinity Church, Boston.

(From a Photograph by H. G. Peabody, Boston.)

bridges and steam-ferries, connect the city with its suburbs.

Boston has been identified with many events of general interest to Americans, such as the meeting of the first grand jury (1635), and the publication of the first regular newspaper (1704). The stern, impatient Puritan spirit of its founders led to the banishment of heretics and the execution of Quakers and witches, and later, to the expulsion of James II.'s officials. The conspicuous part borne by the town in the early troubles with England brought about the 'Boston Massacre' of 1770, in which several people were killed by the fire of the soldiery; and after the destruction of the British-taxed tea in the harbour (1773), the port was practically closed, and the town occupied by a British force, which, in March 1776, was finally compelled to evacuate the place (see BUNKER HILL). From 1830 to 1860 Boston was the headquarters of the movement for the suppression of slavery, against which its citizens had shown a strong feeling as early as 1645. The city has suffered from several destructive conflagrations, that of 1872 having been exceeded in the United States in the extent of the calamity only by the Chicago fire (1871).

Boston was the birthplace of Franklin, Copley the painter, his son Lord Lyndhurst, Poe, Emerson, Ticknor, Sumner, and Parkman, as Cambridge was of Holmes and Lowell; while associated with it and Cambridge have been Hawthorne, Longfellow, Agassiz, Whittier, Motley, Bancroft, Prescott, Channing, Theodore Parker, Dana, Margaret Fuller, Thoreau, Aldrich, the Alcotts, Jameses, and Howells. Pop. (1800) 24,937; (1840) 93,383; (1860) 177,840; (1880) 362,839; (1890) 448,447. Besides the suburbs already named are South Boston and (on Noddle's Island) East Boston; and the cities of Cambridge (q.v.), on the other side of the James, Newton, Somerville, and Chelsea are practically suburbs. See Winsor's *History of Boston* (4 vols. 1880-82).

Boston. THOMAS, a Scottish divine, was born at Duns, Berwickshire, 17th March 1676, son of a father who was imprisoned for nonconformity. Two years after leaving the grammar-school of his native town, he in 1691 entered the university of Edinburgh. He received license as a preacher

in 1697, and was greatly appreciated by the serious portion of the community; but his uncompromising character prevented him from receiving a clerical charge for two years. As he puts it in his autobiography, he was, 'through the mercy of God, generally acceptable to the people, but could never fall into the good graces of those who had the stroke in the settling of parishes.' At length, in 1699, he was ordained minister of Simprin, Berwickshire, and in 1707 was translated to Ettrick, in Selkirkshire, where he died on the 20th May 1732. Of his works the one by which he was best known is the *Fourfold State*, published in 1720. It discourses of human nature in its fourfold state of primitive integrity (in Eden), entire depravity (by the fall), recovery begun on earth, and happiness or misery consummate hereafter. This work went through many editions, and was long recognised as a standard exposition of Calvinistic theology. *The Crook in the Lot* was a little book of a more attractive character, written in a quaint and striking style, and full of allusions to Bible history and biography. This book and his posthumous *Autobiography* (the latter published in 1776) were great favourites with the Scottish peasantry, and were to be found in almost every house. As a pastor, Boston was eminently laborious and deservedly popular. In the ecclesiastical courts he distinguished himself by his zeal in defence of the church's independence, and in the controversy regarding the *Marrow of Modern Divinity* (which was objected to as being too free in its offers of salvation) he was one of the ten ministers who declared their approval of that work (see MARROW CONTROVERSY). As a theologian, Boston had a marked influence upon his own and succeeding generations. His language, sentiments, and characteristic modes of expressing the peculiarities of Calvinistic psychology, have coloured the style of Scottish preaching more than have those of any other writer of the same school. Although often displaying what we should now call narrowness, Boston exhibits also flashes of insight and beauty, quaint felicities of diction—as, for instance, when in *The Crook in the Lot* he warns the profligate against the possibility of a 'leap out of Delilah's lap into Abraham's bosom'—and an occasional shrewdness of thought, which render his works even yet worth studying.

Boswell, JAMES, immortal as the companion and biographer of Dr Johnson, was born at Edinburgh, 18th October 1740. He was the eldest son of Lord Auchinleck, a judge in the Court of Session, who had taken his title from an estate in Ayrshire, which had belonged to the family since the reign of James IV. He had his education at the Edinburgh High School and at the universities of Edinburgh and Glasgow, but his impressionable nature and characteristic love of such distractions and dissipations as were available showed themselves early, and caused much dissatisfaction to the surly but shrewd old judge. A year in London at twenty spoiled him for ever for a provincial. That restless itch for writing, which was yet to lead him so far, made him, a boy of eighteen, keep an 'exact journal,' write poems and prologues to Edinburgh plays, and publish, at twenty-three, a series of would-be clever and witty letters that had passed between himself and a companion of equal age and experience. His capacity for making friends and for falling temporarily in love, and his eagerness to know people that were notorious for anything, were as deep-rooted in his nature as his love of letters and literary distinctions. During his second visit to London he had the supreme happiness to make the acquaintance of Dr Johnson in the back-parlour of Tom Davies's shop in Russell Street (May 16, 1763). The sincerity of the disciple's respect seems to have touched the

master's heart, and the acquaintance quickly ripened into a warm friendship, which stood the strain of many a brutal rebuff on Johnson's part, and was kept in repair by frequent letters on both sides throughout the rest of Johnson's life. A few months later Dr Johnson accompanied Boswell to Harwich, on his journey to study civil law at Utrecht, and parted from him with counsels to be studious and steady, and many expressions of warm affection. At Utrecht Boswell spent one winter between study and dissipation, on an allowance from his father of £240 a year; after which, instead of returning home, he proceeded on a tour through Germany, Switzerland, and Italy, making on the way, with his usual assiduity, the acquaintance of Voltaire and Rousseau. The latter gave him a letter of introduction to Paoli, and to that hero the indefatigable Boswell at once repaired. He was well received by the Corsicans, and for a time played the great Englishman to his heart's content, not forgetting the while to ask Paoli 'a thousand questions with regard to the most minute and private circumstances of his life.' Soon after his return he was admitted advocate (July 1766), and seems to have had some little professional success, and to have employed himself voluntarily at least in the last stages of the famous Douglas cause. His *Account of Corsica* appeared early in 1768, and had great success. Johnson said the journal was 'in a very high degree delightful and curious;' but the poet Gray, whose eyes were undimmed by the partiality of friendship, called it, in a letter to Horace Walpole, 'a dialogue between a green goose and a hero.' Early in 1767 Boswell waited upon Chatham in Corsican costume to plead for Paoli, and was honoured some time after by a warm letter from the great statesman, which encouraged him in reply to the characteristic temerity of asking, 'Could your lordship find time to honour me now and then with a letter? To correspond with a Paoli and with a Chatham is enough to keep a young man ever ardent in the pursuit of virtuous fame.' From this time Boswell's mind was much taken up with a succession of matrimonial schemes, which ended somewhat prosaically with his marriage, in November 1769, to his cousin, Margaret Montgomery, a prudent and amiable woman, who bore him seven children, and who proved herself a sensible and forgiving wife. On the same day his father married a cousin of his own, to the son's disgust and alarm. The old judge allowed his son £300 a year, and from time to time paid his debts for him, but not without much grumbling and many threats. Boswell never became a prosperous lawyer, and continued to make visits to London almost every year. In April 1773, fortunately for the world, but against the wishes of many of the members, he was elected, through Johnson's influence, a member of the famous Literary Club. Later in the same year occurred the memorable journey to the Hebrides. Neither the old judge nor Boswell's own wife could understand the enthusiasm for the uncouth-looking philosopher, and although the latter was studiously polite, she could not hide from the astute Johnson the fact that he was disliked. In 1775 Boswell began to keep his terms at the Inner Temple, and was ultimately called to the English bar in 1786; in 1776 the Auchinleck property was entailed upon him; and in the August of 1782 he succeeded, on his father's death, to an estate of £1600 a year. His last meeting with Johnson was at a dinner at Sir Joshua Reynolds's early in 1784, the year towards the close of which Johnson died. Croker calculated that Boswell met Johnson in all on 180 days, or 276 including the Scotch tour. Boswell now made some attempts to enter on a political career, for some years entertained hopes from the

patronage of Lord Lonsdale, and could not understand Pitt's 'utter folly' in not seeing the value of 'my popular and pleasant talents;' but his sole reward was the recordership of Carlisle, which he resigned in a year, through resentment of his patron's treatment of him. In 1789 his wife died, and henceforward his drinking habits gained the better of him more completely. But indeed he had been drinking all his days, with fits of repentance and solemn promises of amendment between. From his drunkard's hypochondria and the pressure of difficulties for money he found refuge in the preparation of his life of Johnson, which occupied him several years. Spite of occasional despondency and the pinch of financial difficulty, he refused to part with the copyright, and his confidence was justified. The book appeared in the May of 1791, was received with delight, and sold rapidly. A second edition was issued in July 1793. But his success failed to lift him out of his gloom and intemperance, and his health began to give way. He died in London, after a brief illness, 19th May 1795.

Boswell's *Life of Johnson* is admittedly our greatest biography, and the remarkable merit of the book has led many to wonder how it could possibly have been written by a man of such egregious weakness and vanity as Boswell. Indeed, Macaulay advanced the preposterous paradox that it was because of his unrivalled qualities as a fool that its author had written the best life in existence. The true explanation, however, is that this vanity and folly by no means made up the whole mental equipment of Boswell, and that these unenviable qualities in his character have merely become so conspicuous because he had so much less reticence than ordinary men. The man who could retain the friendship of Samuel Johnson, and who could be described as 'the best travelling companion in the world,' was something more than a parasite and a fool. Nor could the most voracious fool have written such a dexterously artistic book. Nothing has suffered in his hands; indeed, we know from some evidence we happen to have about a few conversations, that these at any rate have gained greatly in point from his editorial touch. He adds not one word too much, but gives us the most vivid dramatic pictures by a few simple but subtle strokes. This is not the work of memory nearly so much as of artistic reproduction—it is not photographic and realistic half so much as it is idealistic and creative. We have here a special literary faculty, and, moreover, one of the rarest. This noisy, ugly, foolish, drunken Scotch lawyer and laird had in him something of the true Shakespearian secret.

The latest and best editions of Boswell's great work are those by Napier (4 vols. 1884; two supplementary vols. contain Boswell's *Journal of a Tour to the Hebrides*, and 'Johnsoniana') and by Dr Birkbeck Hill (6 vols. 1887). Invaluable for the new light thrown on Boswell's inner character are his own lifelong *Letters to Temple* (1856), whose acquaintance he had made while yet a student at Edinburgh University, and *Boswelliana* (1874) by Charles Rogers. The famous essays by Macaulay and Carlyle contradict rather than correct each other; but the latter has much more truth in it than the former. There is a *Life* by Percy Fitzgerald (2 vols. 1891).

Boswell's eldest son, ALEXANDER, was born at Auchinleck in 1775, and educated along with his younger brother James at Westminster and Oxford. He settled at Auchinleck, and set up here a private press, at which he printed many rare books in early English and Scottish literature. He had all his father's industry and love of letters, and published many volumes of more or less meritorious verse. Already, in 1803, he had printed a volume of vigorous poems in the Ayrshire dialect,

and in 1817 he contributed twelve songs to Thomson's *Select Collection of Original Scottish Airs*, of which 'Good-night, and joy be wi' ye a', 'Jenny's Baubee,' and 'Jenny dang the Weaver,' are still popular. A devoted admirer of Burns, Boswell raised by his exertions £2000 for the monument on the banks of the Doon. He was created a baronet in 1821 for a loyal song, 'Long live George the Fourth.' He died at Balmuto in Fife, 27th March 1822, of a wound received the day before in his duel with James Stuart of Dunearn, who had challenged him as the author of some anonymous political pasquinades.—JAMES BOSWELL, his younger brother, was born in 1778. He early became intimate with Malone, and assisted him in his Shakespeare work. His name is now known chiefly to Shakespeare scholars as the editor of what is known as the third *Variorum Shakespeare* (21 vols. 1821). He died suddenly at his chambers in the Temple, February 24, 1822.

Boswellia, a genus of Amyridaceæ, of which the species are still very imperfectly known, although the product of some of them—Olibanum (q.v.), generally believed to have been the Frankincense (q.v.) of the ancients—has long been of considerable commercial importance for the preparation of incense. The most important species appears to be *B. carteri*, but several other species or varieties have been described from the same region (Southern Arabia and Eastern Africa, near Cape Guardafui). *B. thurifera* or *seratta* of Coromandel yields a soft fragrant incense-resin, but which is not true olibanum; and the closely allied *B. glabra* also yields a comparatively coarse resin, sometimes used as incense, but also boiled with oil as a substitute for pitch. The Abyssinian *B. papyrifera* (so called from its laminated paper-yielding bast) also yields an olibanum, but it is not collected.

Bosworth, or MARKET BOSWORTH, a small market-town in Leicestershire, 12 miles W. by S. of Leicester. On a moor 2 miles to the south was fought (1485) the battle in which Richard III. was slain, and which terminated the Wars of the Roses. On an elevation, called Crownhill, Lord Stanley placed the crown on the head of the Earl of Richmond, Henry VII. Simpson the mathematician was a native, and Dr Johnson was an usher in the grammar-school. Pop. of parish, 4100.

Bosworth, JOSEPH, D.D., an Anglo-Saxon scholar, was born in Derbyshire, in 1789, and educated at Repton, Aberdeen, and Trinity College, Cambridge. Presented in 1817 to the vicarage of Little Horwood, Buckinghamshire, he devoted all his spare time to literature, and especially to researches in Anglo-Saxon. The result of his labours appeared in his *Elements of Anglo-Saxon Grammar* (1823), and *A Dictionary of the Anglo-Saxon Language* (1838), his *magnum opus*, a new edition of which, by Professor Toller, has been issued from the Clarendon Press since 1882. Bosworth resided as British chaplain in Holland from 1829 to 1840, when he obtained the vicarage of Waithe, in Lincolnshire, in 1857 becoming rector of Water Stratford, Buckinghamshire, and in 1858 professor of Anglo-Saxon at the university of Oxford. He gave £10,000 towards the establishment of a professorship of Anglo-Saxon at Cambridge, having, according to his own statement, realised £18,000 by the sale of his works. He died 27th May 1876.

Böszörmeny, a town of Hungary, 10 miles NNW. of Debreczin. Pop. (1880) 19,035.

Bot, **Bot-fly**, **Gad-fly**, and **Warble-fly**, names common to many insects of the family Eristida, the genus (*Estrus* of Linnaeus). The name bot is sometimes restricted to the parasitic and destructive larvæ, which appears to have been its original use, the other names being given to the

perfect adults, and the name gad-fly often to blood-sucking insects of the very different genus *Tabanus* (q.v.), to which some try to restrict it. The insects of this family are now supposed not to be those which were called *Estrus* by the ancients, although, like them, extremely troublesome to cattle. They are Dipterous (two-winged) (q.v.) insects, nearly allied to the Muscides (House-fly, Flesh-fly, Blow-fly, &c.).

The head is large, and as if blown out: the antennæ are short and spring from deep pits; the proboscis and palps are degenerate: the eyes are small, and there are three eye-spots; the posterior part of the body is rounded; the hindmost legs are often very long. The larvæ have toothed body-rings, and are parasitic in the nose, throat, stomach, or under the skin of mammals, and are unfortunately more familiar than the bee-like adults.

(1) The Horse-bot, or Gad-fly of the Horse (*Gasterophilus*, or *Gastrus* or *Estrus equi*), sometimes also called the *Breeze* and *Horse-bee*, is much less common in Britain than in some parts of the continent of Europe, and occurs chiefly in elevated heathy districts. It is not quite half an inch in length, woolly, with yellowish-gray head, rusty thorax and abdomen, and whitish wings, with brownish-gray spots. The abdomen of the female

Horse Bot-fly:

a, a horse-hair with eggs of bot-fly; b, one egg magnified; c, larva; d, pupa; e, perfect insect female, a little larger than life.

ends in a black horny egg-laying tube. In the later part of summer, the female hovers about horses, and deposits her eggs on their hairs, where they remain attached by a glutinous substance, until they, or the larvæ just emerging from them, are licked off by the tongue of the horse, their destined place being its stomach. It is believed that the fly deposits her eggs only on those parts which are accessible to the horse's tongue, seeming to prefer the back of the knee-joint, where they may sometimes be found in hundreds. The larva is yellowish, without feet, short, thick, soft, composed of rings which have a double row of short teeth surrounding them; it is somewhat sharply pointed at one end—the head; and the mouth is furnished with two hooks, one on each side, for taking hold of the inner coat of the horse's stomach, to which the bot attaches itself, and from which it derives its subsistence, hanging in clusters sometimes of three or four, sometimes of more than one hundred. Here it spends the winter, and in the following summer, when it is about an inch long, it disengages itself, and being carried through the horse's intestines, burrows in the ground, and changes into an oval black pupa with spiny rings, from which, in a few weeks, the perfect insect comes forth. Multitudes, of course, become the prey of birds before they can accomplish their burrowing. It has been disputed whether or not bots are very injurious to horses; and some have with apparent improbability main-

tained that, when not excessively numerous, their presence is rather beneficial.—The Red-tailed Horse-bot (*G. hemorrhoidalis*), also a British species, deposits its eggs upon the lips of the horse, distressing it very much by the annoyance which it gives in so doing. The larvæ attach themselves chiefly to the surface of the intestine and about the anus of the horse, and sometimes cause an annoying irritation. Linseed-oil is used for their removal. *G. nasalis* also finds its way into the stomach, more frequently the small intestine, of the horse.

(2) The Ox-bot, Ox Gad-fly, or Warble-fly (*Hy-poderma* or *Estrus bovis*), is more troublesome than any species of horse-bot. It is a beautiful insect, not unlike a humble-bee, not quite half an inch long, and thicker in proportion than the horse-bots; it has brown unspotted wings: the face whitish, the crown

Ox Bot-fly:

a, larva, full grown, natural size; b, pupa; c, perfect insect, a little larger than life.

of the head brown, the thorax black, the abdomen whitish, with a broad black band around the middle, and yellow hairs at the extremity, where also the female has an ovipositor, a remarkable organ, formed of a horny substance, and consisting of four tubes retractile within one another, like the pieces of a telescope; and the last of them terminating in five points, three of which are longer than the others, and hooked. By means of this organ, a small round hole is pierced in the hide of an ox's back, in which an egg is deposited. Egg-laying takes place during summer, especially in heat and sunshine: hence the importance of cattle having shade, and when possible water shelter. The fly is very quick in depositing her egg, not remaining upon the back of the animal more than a few seconds. Cattle exhibit great alarm and excitement at the presence of the warble-fly, and rush wildly about, with head stretched forward, and tail stuck out, to escape from their tormentor. The further injury done by this insect is often, however, very great; the larva—a little pearl-white maggot (*warble* or *worm*)—feeding upon the juices beneath the skin, causes a swelling, called a *warble*, forming a sort of sac, within which it lives and grows, amidst a kind of purulent matter suited to its appetite; and from which it finally emerges, leaving a small sore, and like the horse-bot, undergoes its further transformations in the ground. The warbles open in January or February, and a breathing chimney communicates with the surface; the larvæ should then be squeezed out, and smothered with any thick greasy matter, such as M'Donnell's dip, cart-grease and sulphur, &c. To prevent the panic and often fatal galloping, train-oil, preferably with some flowers of sulphur and spirits of tar, should be rubbed on spine, loins, and ribs. Warbles also occur, usually singly, under the skin of horses.

Ovipositor of Bot-fly: highly magnified.

(3) The Sheep-bot (*Estrus* or *Cephalomyia oris*) is a much more serious pest than any other British species, and is not unfrequently very destructive to

flocks. The insect is smaller than either the ox-bot or horse-bot, is of a yellowish-gray colour, with a large head and yellow face, and is most abundant in damp situations and woody districts. It is to be seen chiefly in the months of June and

Sheep Bot-fly (*Oestrus ovis*):

a, larva from above; b and c, the same seen from in front and from behind; d, adult insect.

July. Sheep exhibit great alarm when it approaches them, and seem to seek, by keeping their noses close to the ground, and by incessant motion of their feet, to keep it from entering their nostrils. It is in the nostrils of the sheep that this fly deposits its eggs, and the larvæ, when hatched, make their way into the maxillary and frontal sinuses, feeding upon the juices there, until they are ready to change into the pupa state, in April or May of the following year, when they find their way again through the nostrils to the ground. They seem to cause great irritation in their progress up the nostrils of the sheep, and the poor animals run hither and thither, snorting and in great excitement. 'The common saying, that a whimsical person is *maggoty*, or has got *maggots* in his head, perhaps arose from the freaks the sheep have been observed to exhibit when infested by their bots.' The bots cause considerable irritation in the cavities, where they usually fix themselves, and sometimes getting into the brain cause death.—These larvæ move with considerable quickness, holding on by the hooks with which their mouth is furnished, and contracting and elongating the body. It is said that flocks fed where broom is in flower are never infested with them; and when many cases arise in a flock, removal to a dry soil is found particularly advantageous.

These three genera, with their three modes of parasitism, do not complete the list of bot-flies; *Cephenomyia* and *Pharyngomyia* are two others with several species infesting, in their larval state, deer, goats, and other hoofed mammals. Elephants are also afflicted; and *Enterobra* deposits its eggs under the skin of hares and the like. The eggs of one of the species which attacks the fallow-deer are deposited in the nostrils, and the larvæ make their way in large numbers to a cavity near the pharynx. Reindeer are excessively tormented by these insects, one kind depositing its eggs in their nostrils, and another in their skin; and it is no unfrequent thing for a large part of a flock to be destroyed by them. When feeding where bot-flies are numerous, they are said to keep such watch against them, that they neglect to eat, become emaciated, and often actually perish in consequence. Even human beings are said to be sometimes afflicted by insects of this family. Humboldt saw Indians in South America having the abdomen covered with tumours produced by their larvæ. They touch human life more certainly and disastrously in an indirect way by the injuries they inflict upon stock. Dairy and sheep farmers, and stock-keepers generally, not to speak of leather manufacturers, know well the disastrous work of these bot larvæ. The attack of warbles (alone) is now grown to be one causing enormous annual national loss, estimated by practical men at sums from two

million to seven million pounds sterling per annum, at the least, and there is no reason why we should suffer it to go on' (Miss Ormerod, 1887). Those practically interested should consult Miss Ormerod's reports on the Warble-fly and other insect pests.

Botallack is the name of a famous mine on the west coast of Cornwall, 8 m. N. of Land's End. The works are on the edge of the cliff; part of the underground workings (abandoned in 1875) extended 2448 feet beneath the sea. The mine was worked as a tin mine in 1721, in 1841 was famous as a very rich copper mine, and has subsequently been wrought for both or for one of those metals.

Botanical Geography. See GEOGRAPHICAL DISTRIBUTION OF PLANTS.

Botanic Garden. While ordinary gardens are concerned with utility or beauty only, the botanic garden has for its primary aim the promotion of botanical science, and is thus necessarily of comparatively modern origin (see BOTANY). Like the science itself, the botanic garden owes its birth to the needs of pharmacy; thus at the earliest European school of medicine, that of Salerno, we find record in 1309 of the medical garden of *Matthæus Sylvaticus*; while in 1333 a similar garden was established by the Republic of Venice. These private and public examples seem to have been more or less widely followed, yet the botanic garden in the modern sense is usually dated from a private one founded at Padua (between 1525 and 1533), from the public one of Pisa, established by *Cosmo de' Medici* in 1544, or from that of Padua, which dates from the following year, and was greatly enriched by its founders, the Signiory of Venice. The other great Italian cities soon followed this example, and a botanic garden was also founded at the university of Leyden in 1577, and at the universities of Montpellier, Leipzig, Breslau, and Heidelberg before the end of the century. At Paris, too, a royal garden was founded in 1597, but at first, it is said, only with the petty aim of varying the bouquets worn at court: in 1626, however, its scientific purposes were defined: in 1635 chairs of Botany and Pharmacology were founded, and it soon became famous as the *Jardin des Plantes*. The establishment of physis or botanic gardens continued during the 17th century, and those of Oxford (1632) Chelsea (1677), and Edinburgh (1680) may be particularly noted. A further impetus was given by the popularisation of botany in the last century by Linnaeus, and by the consequently increased importance of the subject as a branch of academic education: most European universities, including all German ones, have now their botanic gardens, as well as many purely commercial cities. The leading American universities and cities have also followed suit, the gardens of Philadelphia, New York, and Cambridge being especially well known. Similar institutions, usually of more definite economic aim, have been founded by the principal governments in their colonial dominions; those of Buitenzorg in Java, of Calcutta, and of Paradenya in Ceylon, may be mentioned as of special importance. While almost every botanic garden boasts its own peculiar excellence, the comparatively modern establishment of Kew, founded in 1760, is reckoned the largest, richest, and most fully organised (except for teaching purposes) in the world; those of Paris, Berlin, Vienna, and Edinburgh may also be mentioned as each in certain respects claiming in the foremost rank.

The mode of arrangement of botanic gardens varies infinitely in detail, yet more or less faithfully reflects the state of scientific knowledge and of horticultural and general taste at the period

of its foundation or reconstruction; hence the advantage of the more modern gardens. The Linnean system of arrangement has of course now been replaced by the natural, but in their mode of expressing this no two gardens agree; in some the principle of arranging plants according to their geographical distribution is also largely followed, while economic or medical interests have had a very variable share. The primeval and convenient separation of plants as trees, shrubs, perennial herbs, and annuals has also to be largely attended to; while the very varied origin of the collection, from all countries and climates, necessitates their disposition as nearly as possible in corresponding artificial climates and soils; and thus not only the rockery and alpine garden, the bog garden, and the pond are required beside the ordinary garden beds, but a series of greenhouses and hot-houses of different temperatures and sizes; the latter culminating in the gigantic palm-house. The best garden may be taken as that which best combines all these advantages, and reconciles them with the respective claims of simplicity and beauty; yet no garden can be considered as complete without its accompanying *hortus siccus* or herbarium, its museum, and its library, as well as its laboratories for research, and its lecture-rooms for teaching. It is concerned with the introduction of new plants and the exportation of others to new countries, and thus requires a colonial and international organisation of exchanges and correspondence. It forms a natural centre for the preparation of scientific travellers and the training of gardeners, arboriculturists, nurserymen, and florists; while it owes services both to medical and general education.

While for the full performance of all these varied functions the resources of a great botanic garden are never too ample, it is important to note in conclusion that many of these purposes, and particularly the educational one, can be largely reached upon an incomparably smaller scale. A 'type botanic garden,' illustrating all the more important natural orders of temperate climates, and therefore containing examples of the majority of the plants most important from the point of view alike of botany and medicine, of history, literature, and economics, can be made at altogether trifling expense, and within the narrowest limits. The establishment of such small popular gardens has been followed by the most beneficial results, and their adoption by public and private schools and other institutions is happily in active progress (see BOTANY). For the literature of botanic gardens, see Jackson's *Guide to the Literature of Botany*, pp. 405-453. On Type Botanic Gardens, see *Trans. Bot. Soc. Edin.* (1884).

Botanomancy. See DIVINATION.

Botany is that sub-science of biology which has for its special province the phenomena of the vegetable world. Its general origin and rise, its place among the sciences, its progress in morphological and physiological analysis, and its broadest generalisations, have thus been already outlined under BIOLOGY (q.v.); here it remains to give a sketch of the history of the special study of plants, an account of its present state, and an indication of the most direct and profitable way of approaching the subject. From this brief account the reader may therefore pass on the one hand to the major article BIOLOGY, with its subordinate general articles like MORPHOLOGY, PHYSIOLOGY, &c., and on the other to any of the numerous minor articles concerned with the details of the subject.

1. *History of Botany.*—The special history of the science may be very briefly outlined. Aristotle's treatise *On Plants*, if indeed it was Aristotle's, is

lost, but the writings survive of his pupil Theophrastus, who not only describes about 500 plants, but discusses the vegetable world with something of his master's philosophic spirit. The 1st century produced the *Materia Medica* of Dioscorides—in which 600 plants are named, 400 with descriptions—as well as the writings of the elder Pliny, which, however, contain no original matter, but are simply a compilation of literary and popular knowledge, chiefly with reference to practical uses. Although some knowledge of botany must have been conserved in the medical traditions of the following centuries, we hear nothing of botany until the time of Charlemagne, who was a hearty patron of gardening as well as agriculture. The early Greek knowledge of the subject found its way through the Herbal of Avicenna into Western Europe, and it is probably to this transmission that we owe the 13th-century work of Albertus Magnus, although this is a mere worthless commentary upon the classical writers already mentioned. The merit of initiating the independent observation of plants themselves is usually ascribed to Otto Brunfels of Strasburg, whose *Kräuterbuch* was published in 1537, three years after his death. Similar descriptive efforts followed with increasing rapidity during the remainder of this and the following century, to which period belong many botanists of honourable memory. Among these may be especially named, in Germany, Bock, Fuchs, and the brothers Bauhin; in Switzerland, Gesner; in the Netherlands, Dodonæus, Lobel, and Clusius; in France, Ruellius and Delechamps; in England, Turner; and in Italy, Cesalpino; while the rate and reality of progress may be judged from the fact that while Brunfels describes only 240 species, Bock has 800, Lobel 2191, and Bauhin (in 1623) 6000 species. Botanical travellers also arose, among whom Clusius in Europe and Albin in the east are especially remembered. Botanic Gardens (q.v.) next were founded, classificatory attempts were made with more and more frequency, and the advent of Linnaeus was thus fully prepared for. The later portion of the 17th and beginning of the 18th century is also memorable for the fruitful application of the microscope to the study of plants by Malpighi (q.v.), whose discoveries were continued and extended by his English exponent Grew, as well as by the indefatigable enthusiasm and industry of Leeuwenhoek. The study of cryptogamic plants was thus rendered possible, and its initiation is ascribed to the labours of Micheli and Dillenius during the second quarter of the 18th century. The rise of Vegetable Physiology (q.v.) is also dated from the classic observations (1727) of Stephen Hales upon the movement and pressure of the sap.

The descriptive botanist still necessarily occupied by far the foremost place, especially as the progress of botanical travel was now passing the limits of Europe to bring home an indefinite variety of plant marvels from all the most distant countries. Many stately monographs thus date from the same pre-Linnaean period, while the replacement of the crude and empirical classifications due to Cesalpino and other writers of the 16th century became increasingly hopeful as well as urgent. The classifications proposed by Morison, Ray, and Tournefort were especially of service, and will be considered at VEGETABLE KINGDOM. Under this head must also be discussed the epoch-making *Systema Naturæ* of Linnaeus, as well as the various phases of that necessary replacement of his artificial method of larger grouping which has been in progress during the past hundred years. Although the foundation of the 'Natural System' is with

substantial justice assigned to the two De Jussieus (uncle and nephew), it must also be remembered that its essential principle—that affinities are to be determined not by any single character, but by the sum of all—had been more or less familiar to many of the earlier botanists, particularly to Ray, as certainly also to Linnaeus himself. He in fact proposed his artificial system avowedly as provisional; and the blame of its obstinate and bigoted retention for well-nigh two generations after Linnaeus and the elder De Jussieu had departed, must thus, as in so many other historic cases, be ascribed, not to the purpose of the master, but to the blind and indiscriminating reverence of his disciples in adhering to the letter of his writings at the expense of their general aim and spirit.

The story of this long and laborious indexing of the book of nature is an interesting tale. The wanderings of Clusius were repeated and outdone by the immediate scholars of Linnaeus, a generation later by Humboldt, and again by the younger Hooker, with whom the roll of great travellers fitly closes; and the story has in it an element of epic breadth, as becomes what is indeed the modern re-search after the golden apples. Nor should the patient complementary systematic toil, of which the colossal *Prodromus Systematis Naturalis*, the monument of three generations of De Candolle (Geneva, 20 vols. 1818-73), is only the central work, pass without recognition.

But it is a less favourable aspect of the progress of botany which forces itself on the student. From the petrifying predominance of letter over spirit, no science has indeed been wholly exempt. Yet happily, for the past century at least, no department of knowledge save botany has ever fallen into such utter intellectual torpor, lain in it so long, nay, indeed, even now escaped from it so incompletely. It was much certainly to have done with commentaries upon Dioscorides and Pliny, and again begun after an interregnum of fifty generations to gather fresh flowers and look at them in themselves; still, this return to nature was far less thorough than it seemed. For although the old herbalist's reference-book of dried simples gathered from the fields and woods around his town was growing into a vast herbarium of all the world, and although he had been suddenly raised into a position of high academic honour and influence, the unnoticed drawbacks of such apparently complete scientific success were neither few nor small. The best botanist was thus he who had described most plants and had accumulated the richest herbarium; but the art of describing plants, once clearly learned, became a mechanical routine, a mere Latin clerkship. The inventory done, the interest of the consignment of new plants was exhausted, or thereafter oscillated between the petty pride of priority and possession, and the exercise of the surviving commercial passions in incessant barter. In their new-won academic seats, the systematic botanists in fact speedily absorbed all the vices of the old-world pedantry around them. First, the simple descriptive language of Linnaeus was elaborated into a barbarous terminology which he would have been the first to denounce; and the concrete teaching of the facts of botany became more and more pushed aside. The whole course of degeneration was in fact a curiously perfect outcome and reflection of the established course of general education, in which the abstractions of grammar, at first admitted as a preliminary aid to the study of literature, had finally come to exclude that study for the majority of learners altogether. Nor did these vices by any means wholly end with the victory of the Natural System; some residue of them is inseparable from all study of the subject on a purely morphological

basis. Linnaeus and De Jussieu alike committed themselves to this, and that necessarily so far as their immediate problem was concerned (see BIOLOGY, § 3). They failed sufficiently to realise, or at anyrate to point out to their successors, what an abstraction from the realities of the living world is involved in looking at the plant from a primarily morphological point of view—in regarding it as a fixed and empirical phenomenon of pure form, which may be analysed and compared, named and classified, but admits of nothing more. Hence, while their followers rightly continued to avail themselves of this abstraction, which they found to yield a wealth of detailed results, they became unconsciously enslaved by it, and henceforth mistook for the sole method of botany what was really no more than the necessary artifice of its morphological department. They even unhappily lost sight of the only real problem of their subject, that of interpreting the plant as a changing manifestation of life. It was much indeed to pass from the counting of the reproductive organs only with the Linnean systematist to that comparison and scrutiny of all which was initiated by De Jussieu, and hence to extend our knowledge to the cryptogamic world; and much also to discern with Goethe and succeeding morphologists the deep unity of principle which underlies the widest apparent varieties of form, and which has enabled us to reduce all organs to the simple categories of root, stem, leaf, and trichome or hair, and even to analyse these into their component tissues—epidermic, fundamental, and fibro-vascular; and finally most of all with the embryologist to describe all these forms as the final phases of a process of continuous development from unicellular to multicellular, general to special, simple to complex. In this way we at length reach a morphological conception of even the evolution of organic beings, as a kind of phantasmagoria in which the empirically known forms undergo a broadly similar individual and racial development, and in which individuals and species alike are constantly replacing or being replaced by others. Yet so long as our original standpoint is unaltered, our botany is one-sided; nay, our knowledge is not yet truly biological at all, for we are forgetting that it is the phenomenon of life which is the *differentia* of the science.

Here, then, it is that the real understanding of the subject must begin; our essential problem is to understand the life of the plant, to comprehend the sum of its functions, to answer first of all the questions natural to every healthy mind, whether child's or beginner's, and inquire what is the use to the plant of its root, stem, and leaves, its flower and fruit. To answer these questions rightly involves indeed at once all the preceding morphological inquiries, yet now in a new spirit; for these parts are no longer to be thought of as forms to be discussed by themselves, but as the result of the adaptations in the past and the present of the living being to its surroundings, of organism to environment, inside to outside. Some of these adaptations are active, enabling the plant to utilise its favourable conditions; others passive, to resist its unfavourable ones. Hence, whether we seek rationally to comprehend the history of botany, or its present state, or profitably to undertake its study, the physiological standpoint is the essential one. While recognising the importance and legitimacy of morphological inquiries, of description of general form, or of the study of organs, tissues, cells, and protoplasm (see BIOLOGY, § 3), we have distinctly to correlate and subordinate this sub-science to the physiological interpretation the mind is primarily seeking. Our biological science is a concrete and

dynamic, not an abstract and static one; its highest ideal is a synthetic view of functions and forms, and to this the analysis must be subservient.

Yet in the pre-Linnean, Linnean, and even post-Linnean period, the morphologists predominated almost exclusively: the discovery of the sexes of plants had indeed been made, but lay almost unutilised. Kölreuter might indeed experiment on the fertilisation of plants, and Sprengel exultantly publish his *Secret of Nature Discovered*, but these admirable labours were absolutely ignored until their repetition a century later by Darwin. The physiological investigations of Hales were similarly left uncontinued until comparatively recent times; and the yet more important line of discovery as to the function of leaves and their relation to the atmosphere initiated by Bonnet, Ingenhousz, and Senebier a century ago, seems to have met with similar indifference so far as professed botanists were concerned, although their transcendent physiological, chemical, and agricultural interest secured their continuance after Priestley by chemists like T. de Saussure and Boussingault.

The tendency towards recovery from this dry-as-dust character of the science can of course be traced in the writings of many botanists, especially after the time of Goethe. From faults of this order the 'Naturphilosophie,' of which Oken (q.v.) was the leading representative, certainly escaped. The peculiar extravagances of his speculations can only be explained as the violent reaction of an original but inaccurate mind of strong physiological bias, and his conspicuous failure to make any substantial contribution to science, and the natural repugnance of all the more exact although narrower minds around him to his baseless hypotheses, had a most disastrous effect in discouraging and postponing any trespass beyond the conventional lines of labour, or any progress to a fresher and more vital point of view. The developmental and physiological attitude was, however, much more effectively reasserted by Schleiden, whose *Principles of Botany* (1846) is full of a trenchant and perverid criticism, in spirit and expression often curiously suggestive of Carlyle. His views gained great weight from his high histological and physiological position as the founder of the cell theory; and in no small measure through him progress in Germany henceforth became so rapid as soon to place that country in the van instead of the rear. Not only have the labours of cryptogamists like Hofmeister, Cohn, and De Bary been of wide influence, but great schools have arisen of vegetable physiology—e.g. those of Sachs and Schwendener. Since 1859, the commanding influence of Darwin has been steadily saturating botanical thought. It is to him (see BIOLOGY, p. 161) we owe the authoritative accomplishment of the change from the primarily analytic and static, or morphological view of the plant-world, to the dynamic or physiological one. Here, with the science centred no longer upon the herbarium specimen, but once more, as it were, upon the living dryad, this retrospective sketch of the progress of botany may fitly conclude, leaving further details to be sought for in the articles devoted to the lives of different botanists, and to special departments of the subject.

2. *Present State of the Science.*—While more and more influenced by the historic movement above outlined, the present state of botanical research presents many examples of work in all departments and aspects of the subject. Whole battalions of workers are busy upon each successively deepening plane of analysis (see BIOLOGY, § 3). Thus, although the age of great travellers is necessarily ended, the explorer still finds abundant gleanings in many parts of the world, and the

minor fungi and algae will also long furnish an especially fertile field of systematic labour. The essential problems of the morphology of the higher plants may be said to be mainly solved; and though those presented by cryptogamic plants are less understood, the splendid generalisation which unifies the cryptogamic and phanerogamic plants as members of a single series must always remain the backbone of the subject. As respects tissue and cell, the progress of microscopic investigation is still yielding results of the highest importance, while the study of protoplasm is also rewarding an increasing number of workers. Physiology, as we have seen, is steadily acquiring its due predominance; indeed, the abundance of workers and of results demands a separate discussion. Here we may merely note how these workers fall into two main schools, the one, represented by Sachs, studying protoplasm and cell, tissue and organ, by help of all the resources of chemistry and physics; the other, of which Darwin was the head, concerned with the detailed interpretation of the adaptation of the plant to its mode of life, and with the history of its evolution. In this relation the studies of the botanical geographer and the paleontologist are also of special importance; and it is naturally from this evolutionary school that the synthetic impulse chiefly emanates which is now beginning to be felt in all departments.

The voluminous literature embodying the results of all these labours is published sometimes as of old in separate volumes; more frequently in the proceedings of learned societies; but oftenest in special journals too numerous for mention, of which the weekly *Botanische Zeitung* may be said to occupy the foremost place. Of this copious outflow of new published matter a partial idea can be obtained from such abstracts of selected papers as are published in the *Journal of the Royal Microscopical Society*; while the entire literature of each year is indexed and summarised in the volume of the *Botanisches Jahresbericht*. The most ready and convenient method both of obtaining a general idea of the literature of the subject, and of threading one's way into any of its minor mazes, is by help of Jackson's *Guide to the Literature of Botany* (Index Society, 1880).

3. *Method of Botanical Study.*—While the professed student of botany cannot avoid embarking upon this sea of literature, he can now happily obtain such more or less adequate section charts as are afforded by the manuals of Vegetable Physiology, of the Vegetable Kingdom, or of such special groups as Fungi and Bacteria, which the rising synthetic spirit of recent years has fairly commenced to supply. The beginner, however, demands a single introductory text-book; and simple as his demand may seem, it is absolutely the most difficult to supply. At best, such manuals can never replace good practical oral teaching, or keep abreast of the most recent developments of knowledge. Many of the existing manuals are even positively mischievous. Survivals of one or other of the earlier phases of the science, they land the student at the very outset at some long-past stage of its progress, where he is only too likely permanently to remain. And when not altogether pre-physiological and pre-evolutionary, they are apt to introduce the student to evolution and physiology at the conclusion of his course of study, instead of training him from the outset to grasp and interpret everything by their aid.

The worst of these many introductory manuals are mere crowded morphological compilations, all more or less antiquated, if not inaccurate. Even when they do not confuse and repel the student from the outset, they are wont to reverse that fundamental principle of progress from the known

towards the unknown which underlies all effective research. To the beginner the cell and protoplasm are not the fundamental units that they are to the teacher; they are precisely the things which lie furthest from his experience, and are only intelligible as the ultimate results of a long process of analysis (cf. BIOLOGY, § 3). Most manuals still retain these grammarians' vices more or less completely; even Sachs's serviceable *Text-book* is no exception. A partial transition is afforded by the mode of teaching, and series of manuals, of which Huxley and Martin's well-known *Elementary Biology* is the type. Here, although the attractive but illusory simplicity of proceeding from the solitary cell towards the cell-complex presented by the higher plants is retained, the steps are worked out concretely in the laboratory by the student for himself. Yet this utter change of the field of experience, or at least its sudden narrowing and deepening to that of the microscope, is not found in practice to be widely satisfactory or attractive to the student; for it is with the changeable carpet of the woods and fields, and its world-summary in the botanic garden, that most of the problems of the science and of its general interest alike for ever lie. With child and herbalist the student must begin in the fields, must learn on the one hand to observe and delight in the varied life of plants, and on the other to collect and name and analyse its forms. His studies begin with the buttercup, not with the amoeba; hence should be mentioned Oliver's small manual of *Elementary Botany* (1st ed. 1863), in which we have some record of the village-school teaching of Henslow, the botanist to whom Darwin was wont gratefully to ascribe the first scientific impulse of his life. Even in the best of such books the morphological bias usually remains; and hence it is that the majority of beginners soon instinctively abandon the whole subject as 'dry,' while the minority tend to become, with too many field naturalists, mere unthinking herborisers, and as Schleiden was wont to bewail, become intellectually lost and smothered amid accumulations of mere unused 'hay.' When this tendency is guarded against, however, a *flora* is invaluable; while even the worst text-book may be helpful as a work of reference. Among relatively good manuals may be mentioned those of Gray, Van Tieghem, Sachs, Luerssen, &c.

Is there then no way of escape from this perpetual tendency to the desiccation alike of the matter and of the spirit of the science? Assuredly; it is simply that while we have indeed to collect, and name, and analyse in death, these are not ends in themselves, but simply means towards widening and deepening the continuance of that observant delight in the sum of living things with which our interest surely began. In a word, the highest modern botany neither harvests plants with the herbalist, nor picks them to pieces with the child, but finds alike its rise and climax in watching the blossoms open and the bees come and go. The pedigree of the science is only on one side from the herbals of Dioscorides and Brunfels to the system of Linnaeus or Jussieu: the other and nobler line rises in Virgil's song of living nature, runs through the keen yet simple records of naturalists like those of Selborne and Walden, and culminates in the monumental volumes of the greater naturalist of Down. It is in the school, or rather garden, of Darwin, viewed both as the last of the old-world naturalists and as the first of evolutionists and physiologists, that our modern 'introduction to botany' must begin; studies in the herbarium of the systematist and the special laboratories of the physiologist, anatomist, and microscopist may follow thereafter as occasion requires. For the age of mere analysis, guided only by the love

of incessant novelty, or even by that of unity amid details, is ending; the student may now approach the science in a new spirit, since he can interpret its literature as but the incipient record of that vast drama of the evolution of life, at which it is his rare good fortune to be an awakening spectator.

Avoiding at the outset all terminology, and even all anatomy as well, the beginner cannot do better than attempt some actual observation of plants in their living relations, as of flowers to insects, and the like, and read some of the abundant and popular literature of such subjects. Or if his curiosity need awakening, it cannot fail to be stimulated by such a tale of living wonders as Darwin's classic *Insectivorous Plants*. His introduction to the subject through such characteristically animal attributes as digestion, movement, and sensitiveness, has the peculiar advantage of soon leading him to see how these are only the more conspicuous developments of functions widely diffused throughout the whole vegetable world, and inherent in all living matter alike. When these apparent anomalies are once understood as illustrations of the thorough unity of organic nature, he may still follow the course of Darwin's own mind and work in his *Climbing Plants and Movement in Plants*, and see how the wonderful sensitive-plant shows only a development of the 'sleep movements' of every cabbage-seedling, or how climbing and twining have been generalised with all other plant-movements as mere developments of the gentle *circumnutation* of every growing point. This is indeed questioned in detail, yet the fundamental lesson will have been learned, and the conventional Linnean and utilitarian conception of the plant, as a mere specimen, useful or otherwise, will have been clearly replaced by the physiological one.

But plants not only move but grow: they have relations to soil and atmosphere; they thirstily absorb and copiously transpire. Here we have to inquire into the chemical composition of plants, to investigate their ash and their organic constituents, and to inquire how these were respectively obtained (see VEGETABLE CHEMISTRY, SOILS, &c.). The germinating plant and the blossom are manifestly breathing, sometimes as warmly as an animal (see ANIMAL HEAT); yet this, again, is no anomaly, for all living matter must oxidise and burn away. The functions of the leaf next engage us. We find that given green colouring matter (see CHLOROPHYLL), it can seize the energy of sunlight, reduce the carbonic anhydride of respiratory waste, and pour back oxygen into the atmosphere. Leaving for the present the problematical details of this process, but noting the perfect 'balance of nature' between vegetable and animal life, which is the general result, we must pass to the structure of leaves, and study this first in the light of these essential functions, thence working back to the structure of stem and root; and next, in so far as modified in relation to special functions and environment—e.g. floating or submerged, storing or protective from climate or enemies, insect-catching or attracting, and so on; while leaf-arrangement and bud-packing may here be appropriately considered.

But leaves are not merely vegetative, nor even confined to the purposes of the individual life; they became modified in relation to that of the species, and so we have ultimately *flowers*. This subordination of vegetative life powerfully affects the mode of branching, and gives us the phenomena of inflorescence, while in the individual flowers we have to note the forms and uses of all the separate parts—(1) accessory (sepals, petals), and (2) essential (stamens, carpels). We study the adaptation of all these (α) to the collective

and general function of (cross) fertilisation, and (b) to their respective special functions—(1) protection from climate and enemies, attractive, mechanical; (2) reproductive. The deep modification of floral types in relation to fertilisation by insects or by the wind, as of the lily type towards orchids on one hand, and grasses on the other, next demands notice; and the corresponding utility of floral details—e.g. position and shape of parts, colours, markings, and perfume—may be exquisitely traced.

In the same way, the mature ovary or *fruit* opens up a new wealth of interest; and its adaptations must be traced for (1) protecting the seed from climate and enemies; (2) dispersion of seed—(a) passive, by aid of wind, water, or animals; (b) active, by scattering or planting the seed. Finally, the mature ovule or *seed* rewards attention: its contained embryo has special protection from climate and enemies, its external 'albumen' or its internal store is an accumulated capital for its start in the struggle for existence; and this process of germination has again countless points of interest.

Having in this way gone through the general physiology of the plant, we must not only sum these up into a complete notion of our plants, which we are no longer in danger of thinking of as mere names or specimens, but as varied life-histories. Then, remembering that these are but the individuals of the larger drama, we learn to read some of the complex relations of living beings; to see their incessant individual and interspecific struggle for existence, yet also their increasingly important relations of interdependence.

But this wealth of interesting and varied knowledge, this complex lore of life, encourages us towards a wider and wider acquaintance with the flora, which now promises not merely new specimens for our collection, but an unknown wealth of new knowledge, we may almost say a multitude of strange individual biographies. Yet our observation, to be profitable, must be orderly and detailed; descriptions must be given; and these accurate and exhaustive, yet of tersest, as it were telegraphic brevity. As specimens and descriptions multiply, indexing and nomenclature become indispensable; and thus, at this point, we need help from, and are therefore ready to appreciate, the labours of Linnæus and the whole systematic school. The conceptions of species and genus, and the modes of arranging these into larger groups, are thus no longer the arid abstractions they necessarily seemed before the intellectual need had arisen, but are now indispensable aids; while classification is no longer viewed as an arbitrary jargon only to be learned by rote, but as a provisional attempt towards the rational statement of the actual likenesses and differences between kindred forms, and towards the estimation of their relative importance. See BIOLOGY, § 2.

But since our systematic studies have now brought us face to face with the quarter of a million or more species of the modern herbarium, we require a botanic garden to illustrate a selection of these, nay, a smaller 'type botanic garden' as a key to this again. The phanerogamic series, and in some measure also the cryptogamic orders also, thus commence to lie more clearly before us. Finally, some knowledge of the distribution of the vegetable kingdom in space and time is here seen to be reasonable, and therefore interesting.

Our attempts at classification—at discerning the degrees of likeness—compel a detailed comparison of stems and roots, of leaves and flowers, and this often leads to a difficulty which long perplexed the botanist as well as the zoologist. Obvious and superficial resemblances due to

similarity of environment and function are seen to overlie irreconcilable differences of internal structure or principle; while conversely, some given structural principle becomes modified in the most widely different ways for function and environment. This at first led to mere confusion, but the patient and critical researches of the past generation have clearly distinguished between physiological and morphological resemblance (see MORPHOLOGY); while, finally, the study of individual development and racial evolution enable us to interpret these apparently fundamental and often functionless morphological characters as the residual traces of what were once themselves physiological adaptations in their turn; thus finally demonstrating that ultimate subordination of morphology to physiology which has already been so frequently pointed out. Within its minor province, however, which we have now fairly reached, the study of pure morphology must be abstracted from physiological considerations, and thus yields a series of generalisations of an intellectual simplicity and beauty analogous to those of the crystallographer's. The utmost varieties of form in stem and root are generalised into the conceptions of ascending and descending *axes*; similarly, disregarding shapes and uses, we have bulb-scales, bud-scales, foliage-leaves, and bracts all generalised with sepals, petals, stamens and carpels as *appendages*. Conversely, the plant thus reduced to axis and appendages may be gradually modelled back into the essential types of the various natural orders.

Next, tissues and cells need consideration from the same strictly morphological standpoint, apart from use. Axis and appendages are thus reduced to their constituent systems of tissues—epidermic, fundamental, and fibro-vascular—and these may be either modelled in thought into the many varieties of tissue, of which these furnish the common materials, or traced back to the primeval embryonic tissue from which they are themselves differentiated. This, again, is found to have arisen from the multiplication and differentiation of a single embryonic cell, the (fertilised) plant-egg. And in this way the full magnitude and beauty of Schleiden's deep generalisation of ultimate unity of vegetable composition, which we call the cell theory, becomes manifest when we have similarly worked towards it, and, as it were, rediscovered it for ourselves (see CELL). From this to protoplasm, and thence to the attempt to return along that return wave of progress from simple cell to cell-aggregate and cell-complex, with which, as we have seen, so many manuals attempt to start, is an easy step. Such treatises may now profitably be employed; and we may, as it were, proceed to build up the living world afresh. We thus return once more to the actual living plant with which we started, yet rich in the results of our prolonged analysis. We know the process of development, the facts of structure, and their relation to function; hence the plant, as it were, is transparent to the intellectual eye, and our final mental image of it is something wholly different from the shrivelled index-mummy of an earlier but aberrant botanical school; it is a *working thought-model* which not only develops under the mental eye from unicellular simplicity to ultimate individual form and complexity, but in which all that is known of the details of structure and processes of life can be summoned up and watched at will, and of which the very incompleteness furnishes a perpetual suggestion and impulse to new research.

Although the processes of physiology and development have thus been kept in prominence from the outset, the cognate question of the origin of plants still remains for discussion. The history of the

conception of organic evolution, and the evidences of its actual occurrence, have yet to be set forth; while, if evolution has actually taken place, its rationale still demands explanation. The various hypotheses dealing with this, more especially the current one of natural selection, have thus to be considered; but the problem of variation demands a deeper treatment, of which the essential results have been already indicated under BIOLOGY (§ 6). In any case, so much is clear that our studies culminate in the perception of the vegetable kingdom as a genealogical tree. Our ultimate thought-model is thus 'the great tree of life, which fills with its dead and broken branches the crust of the earth, and covers the surface with its ever-branching and beautiful ramifications.' The problem of accounting for this incessant branching, of determining the law of this beautiful ramification, may therefore be postponed to EVOLUTION.

4. *Botany in Education*.—The place of botany in medical education is historically due to its fundamental relation to *materia medica*, and hence, since pharmacy is becoming completely distinguished from medicine, the teaching of botany is being abandoned in many medical schools. Yet its claims reappear in a far stronger way when it is considered as a preparation in elementary biology. For although the student of medicine may not unjustifiably care little for the collection or dissection of plants, viewed as an end in themselves, he can never dispense with that training in reading the processes of organic life which is afforded by these their simplest manifestations.

As a subject of general education, too, the importance of botany has long been recognised, and now that the dry-as-dust teaching of the subject is being superseded by a more living and interesting method, its re-adoption into the curriculum both of schools and colleges is in progress, and the botanic garden is becoming a familiar adjunct of the school. At anyrate so far as observing goes, the study of botany may more effectively be commenced in childhood than in later life, while initial discipline in drawing, in manipulation, and in the accurate use of language, may all be profitably associated with it. And if it be admitted that for the study of the social sciences preliminary biological studies are requisite, it is in obtaining some concrete acquaintance with the facts of botany that such preparation most conveniently begins.

Botany Bay, a shallow inlet in the coast of New South Wales, 5 miles S. of Sydney, discovered by Cook on his first voyage in 1770, and named by him from the great number of new plants in its vicinity. The spot where Cook landed, on the south shore, is now marked by a monument. In 1787 it received England's first penal colony in the east; and though it was supplanted next year by Port Jackson, a much better harbour to the north, yet it long continued to be the popular designation, not merely of this convict settlement, but of the Australian convict

settlements generally. The ground is still remarkable for the variety and beauty of the flowering shrubs and plants with which it is covered, but, unlike what might be expected, is a sandy and otherwise barren tract, for the most part unfit for cultivation. The village of Botany is connected with Sydney by tramway, and has several schools and a mechanics' institute.

Both, ANDREAS and JAN, two celebrated Dutch painters, brothers, were born at Utrecht in 1609 and 1610. After studying under Abraham Bloemaert, they went to Italy, where they won for themselves a high reputation, Jan painting landscapes in the style of Claude, while Andreas filled in the figures in so careful a manner that the pictures look like the work of a single hand. Andreas was accidentally drowned in a canal in Venice in 1650; Jan then returned to Utrecht, where he died apparently on the 9th August 1652—though a later date is sometimes given.

Bothie (perhaps from the Gaelic *bothag*) signified originally a humble cottage or hut, but for a considerable number of years the term has been more popularly applied to a barely furnished, generally uncomfortable habitation for farm-servants. Though bothies are principally confined to the eastern and north-eastern counties of Scotland, a few are scattered over a much wider area. The bothie, strictly speaking, of modern times is situated either under the same roof as the stable, or oftener at a short distance from the steading. While the cubic contents are invariably disproportionate to the number of inmates, the furnishings are of an uninviting, sometimes actually repulsive character. One long, roughly manufactured table, a few long stools, a chair or two, a number of victual bunks, a few wooden caps or bowls, and a pot or two, constitute the bulk of the fittings. The inhabitants are generally unmarried men, who frequently have their own food to prepare. Some of the larger farmers provide a woman for cooking and cleaning the bothie. The bothie system can only be defended as under present circumstances a necessary evil. With the increase of farm-cottages, and under the pressure of public opinion and the growing desire for social elevation, the evil is diminishing, and will, there is reason to hope, be entirely abolished.

Bothnia, the name formerly given to a country of Northern Europe, extending along the east and west shores of the Gulf of Bothnia, the eastern portion now being comprised in Finland, and the western forming part of the Swedish province of Norrland.

The GULF OF BOTHNIA is that part of the Baltic Sea (q.v.) which lies to the north of Åland Islands, having on its eastern shore Finland, on the western and northern Sweden and Lapland. It extends from 60° to 66° N. lat. and 17° to 25° 35' E. long., its greatest length being 415 miles, and its average breadth 100 miles. Its depth varies from 20 to 50 fathoms, but both along its shores and in the middle are many small islands, sand-banks, rocks, and cliffs, called *skäers*, which render the navigation difficult. It has many good harbours, and from Hudiksvall, Sundsvall, and other ports, timber is largely exported. The rivers which fall into this gulf, both from Sweden and Finland, are numerous; in the upper part of the gulf the alluvial deposits from these have caused the land to extend; in the extreme south-west, on the contrary, the land has apparently been sinking. The waters of the gulf are but slightly salt when the river-flow is greatest; but much more so in winter when the streams are frozen. In winter it is usually so hard frozen that it can be crossed by sledges.

Bothriocephalus (Gr. *bothrion*, 'a little pit,' and *cephalē*, 'the head'), a flat parasitic worm allied to the tapeworm (*Tenia*), in the class Cestoda. In its adult stage it is chiefly found in man and dogs,

Bothriocephalus.

and is common in some parts of Europe, such as Western Switzerland, Northern and North-western Russia, Sweden, &c. The adult form consists of a small 'head' without hooks, but with two spindle-shaped lateral suckers, and of a long chain of joints budded off from the attached region. The joints are at first very slender, but gradually increase in length and breadth (the latter always the greater), and become at a certain distance from the head sexually mature 'individuals.' The joints differ conspicuously from those of the common tapeworm in the position of the genital apertures on the flat surface, and also in this, that they are not liberated from the host individually, but in stretches of a few at a time. The total chain may attain the prodigious length of 5 to 10 yards.

The life-history of the common *Bothriocephalus* of man (*B. latus*) cannot yet be said to be fully known with certainty. The embryo which escapes from the eggs of the ripe expelled joints (*proglottides*) differs from that of the *Tenia* in being ciliated and devoid of hooks. It is free-swimming, and passes, according to Braum, into a fresh-water fish—Pike (*Esox*) or Burbot (*Lota vulgaris*). There it becomes the usual asexual bladder-worm, after it has passed from the gut into the muscle of the fish. When the fish is eaten raw or half-cooked by dog or man, the bladder-worm becomes the 'head' of the *Bothriocephalus*, and attaching itself to the intestine, buds off the long chain of sexual individuals or joints. These are liberated as they ripen, and so the vicious circle is complete. *B. cordatus* is another not uncommon species found in fish-eating animals and occasionally in man. There are numerous species, some of which occur, as we would expect, in birds. *Bothriocephalus* is not so firmly attached to its host as the *Tenia* usually is, and thus admits more readily of expulsion by purgatives and similar expedients. An obvious preventive precaution for man is to see that the fish (*Esox* and *Lota*) be well cooked. See CESTODES, PARASITISM, TAPEWORM; and Leuckart's *Parasites of Man*.

Bothwell, a village of Lanarkshire, on the right bank of the Clyde, 8 miles SE. of Glasgow. The parish church includes the choir of the old collegiate church (1398; restored 1898-99). The river is crossed here by Bothwell Brig, the scene of Monmouth's bloody defeat of the Covenanters in 1679. A mile from the village are the stately ruins of Bothwell Castle, at whose base the Clyde washes the fair scenery of 'Bothwell Bank,' famous for centuries in Scottish song. Held before that by Olifards and Murrays, Bothwell Castle was possessed by the Douglasses from 1365 till 1455; and to them it reverted in 1492, being now owned by their representative, the Earl of Home. Thus, contrary to Professor Schiern's statement, the infamous Earl of Bothwell had no personal connection with the castle, as neither had his nephew, Francis

Stewart (circa 1563-1624), who in 1576 was created Earl of Bothwell, and who figures in history through his daring attempts to obtain possession of the person of James VI. Bothwellhaugh, about 2 miles ESE., gave designation to James Hamilton, assassin of the Regent Moray. Joanna Baillie was a native of Bothwell. Pop. (1891) 2400. See Sir W. Fraser's *Douglas Book* (4 vols. 1885).

Bothwell, JAMES HEPBURN, EARL OF, born in 1536 or 1537, received an ill training at Spynie Castle under his grand-uncle, Bishop Patrick Hepburn of Moray, and in 1556 succeeded his father as fourth earl and as hereditary Lord High Admiral. One of the greatest nobles in Scotland, he professed adherence to the Reformation, but stood staunchly by Mary of Guise, the Queen-regent, who in 1558 made him Warden of the Border Marches, and in 1560 sent him on a mission to France. Then it was that he first saw Queen Mary, and then that Throckmorton described him to Elizabeth as 'a glorious, rash, and hazardous young man, one whom his adversaries should have an eye to.' In 1561, shortly after her landing at Leith, Mary made him a privy-councillor; but his own turbulence and Murray's jealousy made the next three years of his life a period of captivity or exile—captivity first at Edinburgh Castle, and then for more than a twelvemonth in England. Not till her marriage with Darnley did Mary recall him from France; but, on 20th September 1565, she restored him to all his dignities; and five months later he married at Holyrood, with Protestant rites, the Catholic sister of the Earl of Huntly. By hostile accounts, he had ere this had many mistresses, and was addicted to far fouler vices. The hurried events of the next sixteen months must be told in full in our life of Queen Mary—the murder of Rizzio by Darnley (9th March 1566), the birth of James VI. (19th June), Bothwell's appointment as keeper of Dunbar, Mary's visit to him at Hermitage Castle, where he was lying sore wounded by the outlaw Jock Elliot (16th October), Darnley's murder by Bothwell (9th February 1567), the mock trial and acquittal (12th April), Mary's abduction to Dunbar (23d April), Bothwell's divorce (3d and 7th May), his elevation to the dukedom of Orkney (12th May), his marriage to Mary (15th May), and the last parting at Carberry Hill (15th June). On the 27th he sailed from Dunbar, and after brief visits to the Earl of Huntly and to Spynie Castle, passed on to Orkney and Shetland. Narrowly escaping a squadron sent in pursuit, and driven by a storm over to Norway, on 2d September he was brought by a Danish warship into Bergen, and detained as having no passport. He never regained his freedom, but from January 1568 was imprisoned at Malmø, and from June 1573, more rigorously, at Dragsholm in Zealand, where he seems to have gone mad before his death, on 14th April 1578. His Declaration, or so-called 'Testament,' acquitting Mary of all share in Darnley's murder, must, if genuine, have been made before October 1569, but is probably a forgery. See his *Life* by Professor Schiern (Danish, 1863; 2d ed. 1875; Eng. trans. by the Rev. D. Berry, 1880).

Botocudos, the most barbarous of the Indian tribes of Brazil, inhabiting the East Coast range, between the Rio Pardo and the Rio Doce. They are of middle height, sturdily built, and have small hands and feet; their features are strongly marked, with broad cheek-bones, and repulsively thick lips and nose, redeemed by white, regular teeth, and sparkling black eyes. They are rather yellow than copper-coloured, and their hair, of which only a tuft is worn on the smooth-shaven head, is not quite black. Their name is derived from the

Portuguese *botoque*, 'bung-hole,' with reference to their under-lip pierced to hold a disc of wood, sometimes $3\frac{1}{2}$ inches in diameter. They generally go quite naked, and have no fixed settlements, but in their wanderings through the country keep the routes open by means of bridges of creepers woven into ropes. Their food includes anything not absolutely poisons that will stay their hunger; even soft earth is eaten. Their speech is entirely distinct from that of the other Indian nations; they have no religion, properly speaking, but are abjectly afraid of spirits, and pay a certain worship to the moon as creator of the world. Ungovernably passionate, they often commit outrageous cruelties; but through systematically cruel treatment they have been almost annihilated, and now number not more than 4000.

Botoshani, a town of Mollavia, on the Shiska, 62 miles NW. of Jassy, at the terminus of a branch railway, has an active trade in country produce. Pop. 39,941, 63 per cent. of whom are Jews.

Bo-tree, the name given in Ceylon to the PIPAL or PEEPUL (q.v.) of India (*Ficus religiosa*). It is held sacred by the Buddhists, and planted close by every temple. The Bo-tree of the sacred but ruined city Anuradhapura, 80 miles N. of Kandy, is in all probability the oldest tree in the world. It is said to have been planted in 288 B.C., as a branch of the tree under which Gautama sat when he became Buddha. Sir James Emerson Tennent believed that the tree was in 1859 really of the wonderful age of 2147 years. Its leaves are carried away as treasures by pilgrims. The main stem was broken off by a storm in October 1887, and the severed portion solemnly cremated with religious rites. See Ferguson, *Ceylon in 1884*.

Botrychium. See MOONWORT.

Botrytis, a genus of Hyphomycete Fungi (see FUNGI), containing many of the plants commonly called Mould and Mildew (q.v.). The silkworm disease known as Muscardine (q.v.) is caused by *B. Bassiana*. Some species have been identified as simply conidium-bearing forms of Ascomycetes, like *Peziza* and *Sclerotinia*.

Botta, CARLO GIUSEPPE GUGLIELMO, an Italian poet and historian, born in Piedmont in 1766, studied medicine in Turin, and in 1794 became a physician to the French army. In 1799 he was appointed a member of the provisional government of Piedmont. After the incorporation of Piedmont with France, he repaired to Paris, where, as a member of the *Corps Législatif*, he gave offence to Napoleon. After the Restoration he became rector of academies at Nancy and Rouen; and in 1830 he was allowed to return to his native town, and received a pension. He died in Paris, August 10, 1837. Early works are those on Corfu (1799), Dalmatia (1802), and the American Revolution (1809); and his epic poem, *Il Camillo* (1806). His most important works are the *Histoire des Peuples d'Italie* (1825); and *Storia d'Italia dal 1490 al 1814* (20 vols. 1832), which consists of Guicciardini's work (1490-1534), and his own continuation of it. See the Life of him by Pavesio (1874).

Botta, PAUL EMILE, a distinguished archaeologist and traveller, the son of the preceding, was born at Turin in 1802. After extensive travels in the New World and in Egypt, he became in 1833 French consul in Alexandria, and thence undertaking a journey to Arabia, published the results in his *Relation d'un Voyage dans l'Yémen* (1841). He was soon after appointed consular agent at Mosul, and commenced a series of discoveries which form an epoch in archaeological science. Early in the spring of 1843 Botta began his diggings in the heaps of ruins near the Tigris

for monuments of Assyrian antiquity; and the *Journal Asiatique* soon contained accounts of his enterprise, and disquisitions on the cuneiform writing, which afterwards appeared as a separate publication under the title, *Mémoires de l'Écriture Cuneiforme Assyrienne* (1848). The French government took up the matter warmly, and a commission of learned men was appointed to conduct the publication of the magnificent archaeological work, *Monuments de Ninive* (1847-50). In 1848 he published *Inscriptions découvertes à Khorsabad*. In 1846 Botta was appointed consul-general at Jerusalem, and in 1857 at Tripoli. He returned to France in 1868, and died at Acheres, near Poissy, 18th April 1870. See ASSYRIA, BABYLONIA.

Bottesini, GIOVANNI, contrabassist, born at Crema, in Lombardy, 24th December 1823. A concert tour, begun in 1840, and extending to America, established his fame as the greatest master of the double-bass fiddle. From 1846 he was director of Italian opera in Havana, Paris, Palermo, and Barcelona, and died 7th July 1889, director of the conservatory at Parma. His compositions included four operas and an oratorio; but his best work is his *Méthode de Complète de Contre-basse*.

Böttger, JOHANN FRIEDRICH, improver of the porcelain manufacture, was born 4th February 1682 in Reuss-Schleiz. He became an enthusiast in the search for the philosopher's stone, and found patrons at the court of Saxony. The king, dissatisfied with his gold-making, sought to avail himself of the skill which Böttger really possessed, and the latter was compelled to enter upon those experiments, of which the celebrated Meissen Porcelain was the result (see POTTERY). He died March 13, 1719.

Botticelli, SANDRO, originally Alessandro Filipepi, an eminent painter of the Tuscan school of the 15th century, was born at Florence in 1447. He was at first apprenticed to Botticello, a goldsmith, whose name he assumed; but as he showed evidence of his genius for painting, he was transferred to the school of Fra Lippo Lippi. In his youth and early manhood, Botticelli felt the spell of classical mythology, and produced many works on classical subjects—the finest his 'Birth of Venus,' in the Uffizi, and his 'Venus with the Graces,' in the Florence Academy. Two smaller examples of this style are in the National Gallery. He also executed numerous devotional pictures, marked by much imaginative refinement—the 'Coronation of the Virgin,' in the Florence Academy, and the large circular 'Madonna and Child,' in the Uffizi, being famous examples. The 'Assumption of the Virgin,' mentioned by Vasari, was painted, about 1470, for Matteo Palmieri, according to the scheme of the Heavenly Hierarchies adopted in his poem the *Città di Vita*. After Palmieri's death, the picture was condemned and concealed from view, as heretical in teaching the final restoration of the angels who had remained neutral in the strife with Lucifer. It was acquired for 4500 guineas at the Hamilton Palace sale, by the National Gallery, which also contains a lovely 'Nativity,' hinting at the same heresy, a work bearing a mystical inscription, and the date, apparently, of 1500, formerly the property of Mr Fuller-Maitland. Botticelli's colouring, often enriched by gold, is brilliant and fanciful, and the minutest care is shown in all the details of his compositions. His flowers, especially his roses, are painted with marvellous delicacy. In the countenances, whether of Madonnas and angels, or of Venuses and Graces, there is a fascinating expression of wistful melancholy. Among Botticelli's greatest works are his three frescoes, representing the 'Life of Moses,' the 'Destruction of Korah, Dathan, and Abiram,' and the 'Temptation of Christ,' executed before 1484, in the Sistine Chapel

at the Vatican. He was powerfully impressed by the teaching of Savonarola; and, according to Vasari, in his later years he 'occupied himself with commenting on a certain part of Dante, and made figures for the *Inferno*, and put them into print.' His great series of pen and silver-point drawings, illustrating the *Divina Commedia*, was acquired by the Berlin Museum at the Hamilton Palace sale. It has been admirably reproduced in phototype, with the addition of eight other drawings of the set which were discovered in the Vatican, and facsimiles of the engravings to the Dante of 1481, which are now believed to have been executed—perhaps by Baldini—under Botticelli's influence. In age Botticelli became lame, decrepit, and unfit for work, and he died in 1510, a pensioner of the Medici family. See the Monograph by H. Ullmann (Munich, 1894).

Böttiger. KARL AUGUST, a German archaeologist, born in 1760 at Reichenbach, in Saxony, was successively rector at Guben (1784) and Bautzen (1790), and director of the Gymnasium at Weimar (1791). His literary activity was prodigious, but his works, once held in high estimation, are now only valued for the mass of materials they contain. From 1804 he delivered lectures on special branches of classical antiquities and art at Dresden, where he died in 1835. Among his writings may be mentioned *Sabina* (1803), *Amalthea* (1820–25), and *Ideen zur Kunst-mythologie* (1826–36). His smaller works have been collected and edited by Sillig (1837).

Bottle (Fr. *bouteille*, which is the dim. of *botte* or *boute* [allied to Eng. *butt*], 'a vessel'), a vessel, generally of a round shape, with a narrow neck, for holding liquids. The first bottles were probably made of the skins of animals, mostly goats—of this kind were the bottles spoken of in Scripture. Skin bottles are still used in Southern Europe for the transport of wine, and by tribes of Africa and Asia for carrying water. The ancient Egyptians had bottles of alabaster, stone, gold, ivory, and other substances. Glass bottles, often of great beauty, were made by the Phenicians and Romans, and in the middle ages at Venice. Porous earthenware bottles have been long in use in the East to keep water cool in. The Chinese have beautiful small bottles of jade, rock-crystal, agate, and a peculiar glass of two coloured layers. Modern bottles are chiefly made of Glass (q.v.), and of stoneware (see POTTERY). In America, cheap, light, unbreakable bottles for most ordinary purposes have of late been made of paper, especially at Chicago. A long strip of paper is bent round a mandrel, and so made into a tube, which, after being covered with an outer glazed sheet of paper, is cut into lengths. These are fitted with bottoms and necks of paper or of wood, and the insides are lined with a composition intended to resist the action of acids, dyes, spirits, &c.

Bottle-brush Plants. a name applied to species of *Metrosideros*, *Callistemon*, and other genera of Myrtaceæ (q.v.), which agree in having sessile crowded flowers with reduced floral envelopes, but large conspicuous compound stamens; the whole inflorescence thus suggesting a red bottle-brush.

Bottle Chart is one which purports to show the track of sealed bottles thrown from ships into the sea. Lieutenant Becher, an English naval officer, constructed in 1843 a chart of bottle-voyages in the Atlantic, so as to illustrate the currents. The time which elapses between the launching of the bottle from the ship and the finding it on shore, or picking up by some other ship, has varied from a few days to sixteen years; while the straight-line distance between the two points has varied from a few miles to 5000 miles. The

Bottle Chart has been re-edited from time to time, and republished.

Bottle-glass. See GLASS.

Bottle-gourd (*Lagenaria*, from Lat. *lagena*, 'a bottle'), a sub-genus of *Cucurbita* (natural order Cucurbitaceæ, q.v.): The Common Bottle-gourd, or False Calabash (*C. lagenaria* or *L. vulgaris*), is a native of India, but is now common almost everywhere in warm climates. It is a climbing musky-scented annual, clothed with soft down, having its flowers in clusters, and a large fruit, from 1 to sometimes even 6 feet in length, which is usually shaped like a bottle, an urn, or a club. The fruit has a hard rind, and when the pulp is removed and the rind dried, it is used in many countries for holding water, and is generally called a *Calabash* (q.v.). In its wild state it is very bitter and poisonous, and even in cultivation some of its varieties exhibit not a little of the bitterness and purgative properties of *Colocynthis* (q.v.). Other varieties, particularly the more luxuriant, however, have a cooling edible pulp. The bottle-gourd appears to have been introduced into Europe about the close of the 16th century, but it requires for its advantageous cultivation a warmer climate than that of Britain. It is, however, much cultivated in warmer countries as an esculent, and its rind lends itself to many domestic uses, often furnishing, for instance, not only bottles and dishes, but spoons and hats. It is grown in some parts of the United States. Another species, *L. idololatriæ*, is a sacred plant of the Hindus, much employed in their religious ceremonies.

Bottlehead, or **BOTTLENOSE** (*Hyperoodon*), one of the toothed whales in the same family as the Sperm (*Physeteridae*). The most striking feature is the abrupt rise of the head from the small snout. The bones forming the front of the upper jaw rise suddenly behind the nostrils, expanding in crests as they ascend. The result is a rounded and prominent upper head. There is a small conical tooth hidden in the gum at the end of each lower jaw, and sometimes another behind this again. The blow-hole

Bottle head.

is crescent-shaped. The colour is blackish, verging to white below. Two species are certainly known, both from the North Atlantic, and sometimes found in the North Sea. *H. rostratus* (or *bidens*, or *butzkopf*), the common *Bottlenose*, measures about 24 feet in length, and is sometimes stranded on European shores. One described by Hunter in 1787 was caught above London Bridge. *H. latifrons* is somewhat larger, has a flatter forehead, and attains a length of 30 feet. The genus *Xiphius* is closely allied. The *Hyperoodon* must be distinguished from the Bottle-nosed Dolphin (*Delphinus tursio*) occasionally found on British coasts. See CETACEA, WHALE.

Bottling and Bottling Machines. Attention to bottling is of importance not only for the fluids we drink, but also for medical preparations, perfumes, and other liquid bodies, where a porous cork permitting volatile substances to escape, or air to enter, often leaves the contents of the bottle quite worthless. To clean bottles thoroughly they should be left in warm water, containing soda, long enough for any dry films to soften, and then everything adhering to the sides should be removed with a bottle brush. After several rinsings they

should be quite filled with clean water before being left to drain. Shaking up with vitriol removes petroleum and paraffin oil.

From many varieties of machines in use for bottling Aerated Waters (q.v.) we select one (Codd's) for description which is reported to be very serviceable, and which will be easily understood

Codd's Bottling Machine.

from the annexed cuts—one a front and the other a side view partly sectional. Its important parts are the valve, V, for controlling the admission of the aerated water (it does more than this), the lever, L, and slide, S, with their connecting link, which raise the bottle into position and lower it a little for removal when filled. As aerated waters require to be kept under pressure, there is a metal cap at C, supplied internally with an india-rubber ring or washer, against which the mouth of the bottle is pressed to prevent the escape of gas. This form of machine is only suitable for bottles with glass ball stoppers. The attendant has just to raise the bottle into position by the lever, and open the valve by the handle, when the aerated water rushes into the bottle, and, as it fills, lifts the glass stopper into its place. He then lowers the bottle, removes it, and repeats the operation with others. The valve, V, is so designed that while it admits aerated water from the pipe, W, it at the same time lets the displaced air in the bottle escape at the pipe, A.

When it is used for lemonade or any similar sweet drink, the proper quantity of sirup is put into the bottle before it is filled with the aerated water. Another form of this machine has a sirup pump attached to it, in which case the same handle works the valves to admit both sirup and aerated water.

A very simple and efficient kind of bottling apparatus for beer consists of a small wooden trough fed from a barrel, and of sufficient capacity to hold as much liquid as will keep a constant flow through six siphon tubes. The machine is set agoing by the operator sucking the air out of the siphon tubes. He removes a bottle from each of these as fast as it is filled.

For corking-machines, see CORK.

Bottomry, **BOND** OR **CONTRACT OF**, is a security by which a ship and tackle is expressly mortgaged or *hypothecated* by the owner or master, for repairs to the ship, or for money advanced for its outfit or some other necessary purpose abroad. It is called a security by *bottomry*, because the bottom or keel of the ship is figuratively used to express the whole of it. The loan or debt is repayable only in the event of the ship's safe arrival at the port of destination; and in consideration of this risk, the lender or creditor exacts a premium, the amount of which depends on the nature of the adventure. If the ship be totally lost, the lender loses his money; but if she returns safely, he recovers his principal,

together with interest at the rate agreed upon. These contracts are not treated as ordinary mortgages, and preferred according to the order of date; but inversely, the latest is preferred to the preceding, because it is presumed that the last loan saved the ship. Bottomry is sometimes granted in the form of a bill, sometimes as a bond, but it must always be in writing, and must state the sum advanced, with the marine interest agreed on (which often amounts to 25 per cent.), the voyage proposed, with the duration of the risk, and whether the security includes cargo as well as ship. The master's authority to grant such a bond arises only in foreign ports, and depends on the question whether the money is necessary to complete the enterprise. The owners of the ship are not personally liable for the advance, as the marine interest generally swallows up their profit, but the master is liable on his own obligation. Where the personal credit of the owner might be obtained by telegraph, the bottomry bond, granted without his authority, is void. The bottomry creditor is not subject to general or particular average. Bottomry was not known to the civil law; the law of the United States is based on that of England. Bottomry contracts, which are subjected to rigid scrutiny, are assignable and negotiable. See the works of Arnould, Parsons, Marshall, Abbott, Park, &c. on Marine Insurance; also **INSURANCE**, **MERCHANT SHIPPING ACT**, **RESPONDENTIA**.

Botzen, or **BOZEN** (Ital. *Bolzano*), an important trading town of the Austrian Tyrol, charmingly situated on the Eisach, 35 miles NNE. of Trent by the Brenner Railway. An Italian-looking place, it has several churches and monasteries—one of the former dating from the 13th century—a castle, and a gymnasium. It is protected from the inundations of a mountain-torrent in the vicinity by a strong wall about 2 miles in length. It has manufactures of silk, cotton, linen, hosiery, leather, flour, and vinegar. Wine and fruits in abundance are produced in the fertile valley of the Adige, protected by lofty mountains. Pop. 11,744.

Boucher, **FRANÇOIS**, a French painter, was born at Paris in 1703, studied at Rome, and became a member of the Academy (1734), and painter to Louis XV. (1765). He was an artist of much ability, and equally facile in the production of figure or landscape pictures. The number of his pictures and drawings is said to have exceeded 10,000; he also executed engravings. At his death, which occurred May 30, 1770, he was director of the French Academy.

Boucher de Crèvecœur de Perthes, **JACQUES**, anthropologist and writer, born at Rethel, 10th September 1788. Through his father, an active botanist, he came under the notice of Napoleon, and was employed in numerous missions to Italy, Germany, Austria, and Hungary. From the Restoration he lived at Abbeville, and there he died, 5th August 1868. He wrote travels, poems, and an early apology for free-trade; but only his works on the archaeology of man are of consequence now. The first, *De la Création* (5 vols. 1839-41), already brought him some reputation, but his long investigations on stone weapons and other remains of early human civilisation in the tertiary and older quaternary diluvial strata made him famous. His most striking discovery was that of a fossil human jawbone in the quarries of Moulin-Quignon, near Abbeville, in 1863. Other works of great value are *Antiquités Celtiques et Antédiluvienne* (3 vols. 1846-65), and *De l'Homme Antédiluvien et de ses Œuvres* (1860).

Bouches-du-Rhone ('mouths of the Rhone'), a department in the south-east of France, formerly a part of Provence, with an area of 1971 sq. m.

It is divided into the three arrondissements of Marseilles, Aix, and Arles. Through the northern and eastern districts the Maritime Alps slope gently down to the basin of the Rhone. Towards the seashore there are several plains of considerable extent; the western portion called the Camargue is very unhealthy. The amount of arable land is small; heaths, woods, wastes, and water occupy the rest. The Rhone—which between Arles and the sea separates into several branches, forming a delta, called *Ile de la Camargue*—and its affluent, the Durance, are the principal rivers. The department is intersected by several canals of importance, and by a great aqueduct conveying water from the Durance to Marseilles. The soil in some parts is strongly impregnated with salt. The great plain of Crau, to the east, is stony and arid. Besides the Etang de Berre, there are numerous salt-lakes communicating with the sea by natural or artificial channels. Marble, limestone, and gypsum are found, and from 1000 to 2000 men are engaged in coal-mining. Leather, hats, perfumes, soap, olive-oil, vinegar, and chemical products are manufactured; there are extensive brandy-distilleries and sugar-refineries; the produce of the salt-works is larger than that of any other part of France, and that of wine is large. Pop. (1872) 554,911; (1891) 630,622.

Boucicault, DION, dramatist and actor, was born at Dublin, 26th December 1822. He was educated at University College, London, and in 1841 produced his first drama, *London Assurance*, before he was nineteen years old. It was signally successful, and its success determined his career. Once embarked in the career of a playwright, Boucicault produced piece after piece in rapid succession, in comedy, farce, and melodrama. When he went upon the stage he secured a high reputation as an actor. From 1853 till 1860 he was in America. On his return to England in 1860, he produced *The Colleen Bawn*, the first of several popular Irish dramas which proved among the most successful of modern times. This was followed by *Arrah-na-Pogue* (1864), and *The Shaughraun* (1875). The popularity of another 'sensation' drama, *The Octoroon* (1861), was inferior only to that of *The Colleen Bawn*. For a time he was joint-manager of the Adelphi, and in 1862 opened a new theatre in London, the Westminster, but was ruined by the speculation. He afterwards re-established his fortunes by new plays, in some of which he and his wife took the leading parts. *The Streets of London*, *Flying Scud*, and *After Dark* were the most notable of his later works, all of which are of the 'sensation' school, with which, it may be said, he first familiarised the public. He wrote more than 140 original pieces and adaptations. In 1876 he went to live in New York, but in 1887 visited England, taking part in one of his own plays, *The Jilt*. He died at New York, 18th September 1890.

Bouc, AMI, geologist, was born at Hamburg, 16th March 1794; studied at Geneva, Paris, Edinburgh, and Berlin; lived at Paris, and then at Vienna, where he died, 22d November 1881. He travelled extensively, and wrote many geological works, one on the geology of Scotland (1820), and three on the geology of Turkey in Europe.

Boufarik, a town of Algeria, 23 miles S. of Algiers by rail. Pop. 4621.

Boufflers, LOUIS FRANÇOIS, DUC DE, peer and marshal of France, one of the most distinguished generals of his time, was born in 1644, of an ancient family of Picardy. He began his military career early, and served under the great Condé, Turenne, and Catinat in the wars of Louis XIV., with such distinction that he received the mar-

shal's baton in 1693. His famous defence of Namur against William III. in 1695, and of Lille against Prince Eugene in 1708, made him a duke and peer of France. After the defeat of Malplaquet in 1709, he conducted the French retreat with admirable skill and success. He died at Fontainebleau, 20th August 1711.—His son, JOSEPH MARIE, Duc de Boufflers (1706–47), was likewise a marshal of France.

Boufflers, STANISLAS, MARQUIS DE, commonly styled the Chevalier de Boufflers, was born at Lunéville in 1737. He was the son of the witty Marquise de Boufflers, who played a brilliant part at the court of Stanislaus, the exiled king of Poland. He rose to the rank of marshal, was a poet and literary man of some note, and much admired in the French salons of his time. He died in 1815. We have his *Œuvres Choisies* (4 vols. 1828), and a new edition of his *Contes en Vers et Prose* (1878).

Bougainville, LOUIS ANTOINE DE, navigator, was born at Paris, 11th November 1729, studied there, and attained great proficiency both in languages and science. In 1755 he went as secretary of the French embassy to London. In 1756 he acted as Montcalm's aide-de-camp in Canada, where he served with distinction, as also in the campaign of 1761 in Germany. After the peace he entered the naval service, in which he soon signalled himself. He undertook a voyage round the world (1766–69) with a frigate and a St Malo transport, the first voyage round the world which the French ever accomplished. He gave an account of it in his *Description d'un Voyage autour du Monde* (1771–72). Geography and other branches of science were enriched by it with many discoveries. In the North American war Bougainville commanded several ships of the line, and in 1779 was made *chef d'escadre*: in the following year he was made a field-marshal in the army. After the outbreak of the Revolution he retired from public service, and devoted himself entirely to scientific pursuits. By Napoleon I. he was made a senator, count of the empire, and member of the Legion of Honour. After him are named one of the Solomon Islands, a strait in the New Hebrides, and a bay on the north side of the Strait of Magellan. He died 31st August 1811.

Bougainvillea, a neotropical genus of Nyctag-

Bougainvillea, foliage and flowering branches:
a, two sets each of three flower-buds, with coloured bracts.

ginaceae, frequently trained over trellises or under

the roofs of greenhouses, on account of the beauty of its peculiar inflorescence, the small flowers, which grow in threes, being almost concealed by as many membranous bracts of splendid rosy or purple colour.—The same name is given to a genus of hydroid zoophytes.

Bough. SAMUEL, R.S.A., landscape-painter, was born 8th January 1822, at Carlisle, where for two years he was employed in the office of the town-clerk. He received hints from various painters, but never obtained any systematic art instruction. In 1845 he was a scene-painter in Manchester, and later in Glasgow, where Daniel Macnee, afterwards P.R.S.A., encouraged him to become a landscape-painter; and he shortly produced several sketches in Cadzow Forest, and 'Shipbuilding on the Clyde.' Among the more important of his oil-pictures are 'Edinburgh from the Canal' (1862); 'Holy Island' (1863); 'In the Trossachs' (1865); 'The Vale of Leith' (1866); 'Kirkwall Harbour' (1867); 'Borrowdale'; 'St Monance'; 'London from Shooter's Hill' (1872). His 'Royal Volunteer Review' (1860) is in the National Gallery of Scotland. His best oil-pictures are spirited and expressive in touch, and possess a fine sense of atmosphere; but he frequently painted carelessly and hurriedly, and produced much, especially during his later years, that was unworthy of his brush. His numerous water-colours are of more uniform excellence; they are strongly influenced by the example of David Cox, and are especially remarkable for the delicate gray tones of their skies. In 1857 Bough was elected A.R.S.A., and in 1875 R.S.A. He had settled in Edinburgh in 1855, where he died 19th November 1878. A collection of over 200 of his works was brought together in the Glasgow Institute in 1880.

Bought and Sold Notes. See CONTRACT NOTES.

Bougie, a port of Algeria, on the Bay of Bougie, 120 miles E. of Algiers. Bougie was the *Saldra* of the Romans, and in the 5th century was a chief seat of the Vandals; under the Arabs it was raised to such importance that it was called Little Mecca, and was the entrepôt of the trade between Christendom and North Africa; but after various vicissitudes, it had sunk to a small village in 1833, when the French captured the place. Their extensive works have since rendered it a strong fortress, and a commercial centre of some value. Pop. 6248.

Bougies are rods of metal or other substances, used for distending contracted mucous canals, as the gullet, bowels, or urethra (see STRICTURE). For the urethra, they are frequently of German silver or pewter, and vary from $\frac{1}{16}$ th to $\frac{1}{4}$ th of an inch in diameter. Still larger sizes are used by many surgeons. For the other canals, they are usually made of plaited thread, like an ordinary riding-whip, impregnated with a substance called *gum-elastic*, of which the chief constituent is india-rubber. This combination of materials possesses a degree of firmness united with flexibility, and a smoothness of surface very suitable for the end to be attained. In form they are cylindrical, with either a slightly tapered round extremity, or a somewhat acorn-shaped dilatation at or near the point. The name is also applied to rods of similar shape made of gelatin, cacao-butter, or some such substance, which melts at the temperature of the body, and charged with medicaments, which it is desired to apply to the mucous membrane of the urethra or the nasal cavities.

Bouguer. PIERRE, a great French physicist, born at Croisic, in Brittany, 16th February 1698. In 1735 he was sent with Godin, La Condamine, and

Jussien to South America to measure a degree of the meridian at the equator. During their seven years' absence Bouguer and his companions made valuable observations on the length of the seconds pendulum at great elevations, the deviation of the plumb-line from a vertical position through the attraction of a neighbouring mountain, the limit of perpetual snow, the obliquity of the ecliptic, &c. He published an account of his labours in the *Théorie de la Figure de la Terre* (1749). His investigations concerning the intensity of light laid the foundation of photometry; their results were fully embodied in his *Traité d'Optique* (1760). In 1748 Bouguer invented the heliometer, afterwards brought to greater perfection by Fraunhofer. He died at Paris, August 15, 1758.

Bouguereau. WILLIAM ADOLPHE, born at La Rochelle, 30th November 1825. While engaged in business at Bordeaux he was instructed in art; and proceeding to Paris, he worked under Picot, and in the Ecole des Beaux Arts, where in 1850 he gained the *Grand Prix de Rome*, which entitled him to study in Italy, whence he returned in 1855. In 1849 he produced his dignified and austere 'Angel of Death,' but he first made a distinct mark in 1854 by 'The Body of St Cecilia borne to the Catacombs,' which, along with his 'Philomela and Procne' (1861), is now in the Luxembourg, and his 'Maria Consolatrix' (1877) was also a government commission. Among his other works may be named 'The Bather' and 'Vow of St Anne' (1870); 'Harvest-time' and 'The Mower' (1872); 'Nymphs and Satyrs' (1873); 'Homer and his Guide' (1874); 'Holy Family' (1875); 'Youth and Love' (1877); 'Triumph of Venus' (1879); and 'Alma Parens' (1883). His productions are distinguished by a kind of cultured academic grace, finished and balanced design, and careful execution with a smooth surface. He is seen at his best in classical subjects, and in softly idealised scenes from rural life. Occasionally he has painted portraits; and among his decorative works are subjects in the Hôtel Péreire, Paris, a ceiling in the theatre, Bordeaux, and paintings in the churches of St Clotilde and St Augustin, Paris.

Bouillé. FRANÇOIS CLAUDE AMOUR, MARQUIS DE, a distinguished French general, was born in 1739 at the castle of Chuzel, in Auvergne, entered the army at the age of fourteen, and served with distinction in Germany during the Seven Years' War. In 1768 he was appointed governor of the island of Guadeloupe, and afterwards commander-in-chief of all the French forces in the West Indies. When war broke out in 1778, he successively took from the British, Dominica, Tobago, St Eustache, Saba, St Martin, St Christopher's, and Nevis. Louis XVI, nominated him a member of the Assembly of Notables in 1787-88; in 1790 he was made commander-in-chief of the army of the Meuse, the Saar, and the Moselle. His decision of character prevented the dissolution of the army and the outbreak of civil war. For his share in the attempted escape of Louis XVI, he had to flee from France. In 1791 he entered into the service of Gustavus III. of Sweden, and afterwards served in the corps of the Prince of Condé. He rejected a proposal made in 1793 that he should take the chief command in La Vendée; and went to England, where his advice in West Indian affairs was useful to the government, and where he wrote his *Mémoires sur la Révolution Française*. He died in London, 14th November 1800. See Gabriel's *Louis XVI., Bouillé, et Varennes* (1874).

Bouillon. a duchy, originally German, in the Belgian part of the grand-duchy of Luxemburg, consisting of a woody and hilly district in the Ardennes, about 145 sq. m. in extent. This duchy

was the possession of the famous crusader, Godfrey of Bouillon, who, in order to raise money for his crusade, pledged it in 1095 to the Bishop of Liège. It was conquered by France in the war of 1672. By the peace of 1814, the greater part of it was included in the grand-duchy of Luxemburg, and the sovereignty of it passed to the king of the Netherlands. By the revolution of 1830, Bouillon, along with Luxemburg, was separated from the Netherlands, and in 1837 united to Belgium.—The principal town is Bonillon, situated between steep hills on the Semoy, 9 miles NNE. of Sedan, and near the French frontier. Pop. 2765. For the crusader, see GODFREY.

Bouilly, JEAN NICOLAS, a prolific French dramatist, born at La Condraye, near Tours, 24th January 1763. During the fever of the Revolution he filled with rare prudence several important public offices. He died at Paris, 14th April 1842. In his writings, Bouilly reveals a character of rare elevation and sincerity, but the effect is somewhat marred by his prolixity and by an over-sentimentality that earned him the name of the 'poète lacrymal.' Of his plays the following deserve mention: the comic opera *Pierre le Grand* (1790), *L'Abbé de l'Épée* (1795), *Les deux Journées* (1800) for Cherubini's music, *Fanchon* (1803), *Une Folie* (1803), *Madame de Sévigné* (1805). He wrote many popular books for the young, including *Contes à ma Fille* (1809).

Boulak, or BULAK, the port of Cairo, on the Nile, opposite an island of the same name, about one mile NW. from that city, of which it forms a suburb. It is a close-built town of poor houses, extremely dirty, with very narrow and irregular unpaved streets. It contains the custom-house and warehouses of Cairo, a school of engineering, cotton, paper, and sugar factories, and the government printing-press. Here was formed by Mariette Pasha the national museum of Egyptian antiquities (removed in 1889-90 to Gizel) which contained the results of systematic excavation, including many of the relics brought to light through the Egyptian Exploration Fund. Pop. 20,000.

Boulainvilliers, HENRY, COUNT, an eminent French author, descended from an ancient family in Picardy, was born 11th October 1658, at St Saire, in Normandy. He resigned the military profession, and devoted himself to the investigation of the genealogy of the ancient families of France. His writings, which are pervaded by extreme aristocratic sentiments, were first published after his death, which took place on 23d January 1722. The most valuable of them are his *Histoire de l'Ancien Gouvernement de France* (3 vols. 1727), his *Histoire de la Pairie de France et du Parlement de Paris* (2 vols. 1753), and his *Abbrégé Chronologique de l'Histoire de France* (3 vols. 1733).

Boulanger, GEORGE ERNEST JEAN MARIE, a French general, was born at Rennes in 1837, and was educated at St Cyr. He served in Algeria, Italy, and Cochín-China; was with Bazaine at Metz, but escaped to Paris, and held a lieutenant-colonelcy under the Government of National Defence; in 1876 headed the deputation of French officers at the celebration of the centenary of American Independence; became brigadier-general in 1880, by the influence of the Duc d'Annamale; and in 1884-85 commanded the army of occupation in Tunis, till an arbitrary attempt to exalt the military over the civil authority led to his recall. He was wounded in action in Italy and during the Commune. He was minister of war from January 1886 to May 1887, urged forward the expulsion of the Duc d'Annamale and the other princes from France, and through the introduction of some desirable army reforms and the appearance of a

fortunate music-hall song in his praise, was adopted as the embodiment of the 'revenge' policy by the Parisians, who for some months suffered from what was termed the Boulanger fever. In 1887, while commanding an army corps at Clermont-Ferrand, he was, for his remarks on the then war minister, ordered under arrest for thirty days. In March 1888, for disobedience to orders, he was deprived of his command; but was immediately elected deputy for Dordogne, and shortly thereafter for Nord. He was wounded in a duel with M. Floquet, the minister-president, in the same year. Boulangerism became still more formidable in 1889, and was supported with large sums of money by leading Royalists for their own ends. But when the government prosecuted Boulanger for intrigues against the republic and malversation of funds, he fled (1889) the country. He was condemned in absence; his schemes wholly collapsed, and on 30th September 1891 he shot himself on his mistress's grave in a cemetery in Brussels.

Boulay de la Meurthe, ANTOINE, COUNT, a French statesman, born at Chammonzey, in the Vosges, in 1761. He espoused the cause of the Revolution, but became known as the opponent both of Jacobinism and the despotism of the Directory. Under the Empire he had an important part in the preparation of the *Code Civil*. Returning in 1819 from Germany, he lived in retirement at Paris, where he died 2d February 1840. He published an essay on the *Commonwealth in England* (1799), and *Bourrienne et ses Erreurs* (1830).

Boulder-clay is a stony clay which has a very wide geographical distribution. It occurs in the British Islands, as far south as the Bristol Channel and the valley of the Thames. It overspreads extensive areas in Scandinavia, Holland, Northern Germany, and Central and Northern Russia. In the lower valleys of the Alps, and many other mountain districts of Central and Southern Europe it is also well known. It has likewise been traced over vast regions in British America and the northern states of the Union. Boulder-clay varies in thickness from a few feet up to 20 or 30 yards—being generally thickest upon low-lying regions, and thinning away as it is followed up towards the mountains. It is unstratified, and contains stones scattered confusedly through its mass without any reference to their relative size and weight. These stones are of all shapes and dimensions, from mere grit up to great blocks several tons in weight. Many of them are blunted and subangular, and show on one or more sides that smoothed, abraded, and striated appearance which is characteristic of glacial action. The clay itself is generally more or less tough and hard, and has apparently been subjected to intense pressure, as is further shown by the presence now and again of a kind of 'pseudo-lamination' or 'pseudo-bedding,' often marked by differences of colour, and sometimes by lines of stones. These structures appear to be due to the shearing and yielding of the clay under pressure. Here and there lenticular patches of water-worn stones, and gravel, sand, and clay occur completely inclosed in the tumultuous stony clay—being confused, contorted, and involved with the latter in such a way as to show that they and the stony clay had been rolled forward upon each other. The included stones are more or less local in character—that is to say, the great majority in any individual sheet of boulder-clay have been detached from rocks belonging to the drainage area within which that particular sheet of boulder-clay occurs; while those fragments which have come from a greater distance can be shown to have travelled in one and the same direction as the locally derived stones and boulders. In like manner, the colour of

the clay is more or less local. Thus, in regions composed largely of red-coloured rocks, the boulder-clay is red; while it may be yellow, gray, or blue in other regions, according to the prevailing colours of the rocks upon or near to which it lies. Fossils have been met with at rare intervals in boulder-clay, but these are always derivative, and not unfrequently they are smoothed and striated in the same manner as the stones; in other words, they are boulders just as are the stones amongst which they lie. In many places, where the boulder-clay has been stripped off the underlying rocks, these are found to present a highly smoothed and abraded surface, streaked with rectilinear grooves and scratches, the trend or direction of which corresponds with that followed by the stones and boulders in the boulder-clay. Not unfrequently, however, the underlying rocks present a very shattered and confused appearance under the clay—larger and smaller masses being inclosed in the lower part of the boulder-clay—the bottom portion of which, indeed, is often entirely composed of the debris of underlying rock-masses, which have all the appearance of having been torn out of their places and dragged forward in the direction followed by the further-travelled blocks and boulders of the boulder-clay. In the lower reaches of mountain valleys, as in those of Britain, the Alps, the Pyrenees, &c., boulder-clay tends to form gently undulating or approximately level sheets or layers, which being cut through by streams or rivers, form more or less bold bluffs and scurs. In some low-lying tracts, however, it is often arranged in long parallel banks or ‘drums,’ and ‘sowbacks’—the general trend of which corresponds with that of the stria or scratches on the underlying rocks, and with the direction followed by the boulders in the boulder-clay. Excellent examples of *drums* occur in Nithsdale and in the lower valleys of the Teviot and the Tweed. In these and many other regions the boulder-clay is frequently found heaped up on one side of prominent rocky knolls and hills, the steep faces of which *front* the direction in which the boulders of the clay have travelled. This is the appearance called ‘crag and tail’—the tail being composed largely of boulder-clay. As examples may be cited Eilinburgh Castle, Dalmahoy Crag, and other isolated hills near Edinburgh. The origin of boulder-clay, which has been the subject of much discussion, is now hardly in dispute. Boulder-clay is unquestionably the product of glaciation, and the phenomena mentioned above lead to the belief that this stony clay is simply the bottom-moraine or ground-moraine of extinct glaciers, which formerly had a most extensive development in the northern and temperate latitudes of the globe (see GLACIAL PERIOD, KAMES, MORAINES). Boulder-clay must not be confounded with the *marne* clays, which contain the remains of marine shells, &c. of arctic and northern species. These clays are usually more or less well bedded, and the stones contained by them have evidently been dropped from floating ice. Boulder-clay is known in Scotland as *Till*—a term which many geologists prefer, inasmuch as boulder-clay is often rather a stony earth than a clay. Formerly the terms *Diluvian* and *Drift* were used to designate boulder-clay and certain gravelly and arenaceous deposits frequently associated with that accumulation; but they are now seldom or never used. In the Alpine regions boulder-clay is known under the names of *Grand-moraine*, *Moraine profonde*, or *Moraine de fond*; in Germany it is called *Geschiebemergel*, *Geschiebelehm*, or *Blocklehm*; and *Krosstenslera* in Sweden.

Boulders, ERRATIC, are large masses of rock found at a distance from the formations to which they belong. The term is generally applied when they are found lying detached on the surface.

Large blocks of Scandinavian rocks are scattered over the plains of Denmark, Prussia, and Northern Germany. From their magnitude and number they frequently form a striking feature in the landscape. Some of these have been washed out of the Boulder-clay (q.v.), but the larger number are dotted over the surface of the terminal moraines of the great northern ice-sheet (see GLACIAL PERIOD). They abound on the shores of the Firth of Forth. Such boulders are simply the residue of the boulder-clay which has been denuded and washed away by the action of the sea. The pedestal of the statue of Peter the Great, in St Petersburg, was hewn out of a large erratic boulder, 1500 tons in weight, that lay on a marshy plain near that city. The boulder called *Pierre de Marmettes* at Monthey, in the canton of Valais, contains 70,630 cubic feet, and is

Erratic Boulder at Monthey.

large enough to have a chalet built on it. From the nature of the stone, it is believed to have been carried by glacier action a distance of 35 miles down the valley. On the other hand, the well-known ‘Boulder Stone’ of Borrowdale (q.v.) is simply a detached block, which has fallen from the adjacent crags.

Boulevard (Fr., also spelt *boulevard*; apparently a corruption of a Teutonic word = Ger. *bollewerk*; cf. Span. *buluarte*, Ital. *buluardo*, ‘bulwark’), the name given in France to a broad street or promenade planted with rows of trees. Originally it was applied to the bulwark portion of a rampart, then to the promenade laid out on a demolished fortification. The boulevards of Paris are the most famous. The line from the Madeleine to the Bastille became a walk in the days of Louis XIV., and then a street. The so-called outer boulevards date from 1786, and were also old fortifications, levelled and planted. But many so-called recent boulevards in Paris and elsewhere are simply new and handsome streets, planted with trees, and have no relation to old fortifications at all. Some parts of them present a very dazzling spectacle; and, as a whole, they afford a striking exhibition of the life and character of the French capital in all the different classes of society. The *Boulevards de la Madeleine*, *des Capucines*, and *Montmartre* are the most notable. The Thames Embankment is a boulevard in the usual sense of the term.

Boulogne, a town of France, in the department of the Seine, on the right bank of the river of that name, about 5 miles SW. of Paris, from which it is separated by the Bois de Boulogne. It has numerous villas, and over 400 wash-houses on the river, which is here crossed by a line stone bridge of twelve arches. Pop. (1891) 32,569. The Bois de Boulogne is traversed by many walks,

through the broadest of which the fashionable world of Paris travels in Easter-week to the Abbey of Longchamp. At the entrance of the wood lies Anteuil (q.v.). During the Revolution, the trees of the older walks were mostly cut down; but when Napoleon chose St Cloud, in the immediate neighbourhood, for his summer residence, new walks were planted and laid off, and the inclosing walls were restored. All traces of the injuries inflicted during the siege of 1870-71 have now disappeared, and the Parisian can again enjoy his favourite place of recreation.

Boulogne-sur-Mer, a fortified seaport in the French department of Pas-de-Calais, situated at the mouth of the Liane, in the English Channel, 27 miles SW. of Calais, and 158 N. by W. of Paris by rail. The town consists of two parts—Upper and Lower Boulogne. The upper town was in former times strongly fortified; but its ramparts have been converted into beautiful promenades, from which, in clear weather, Dover Castle can be seen. The upper town contains the hôtel-de-ville, on the site of the castle where Godfrey de Bouillon was born in 1061, and the former cathedral, rebuilt (1827-66) in the Italian style, with a dome 300 feet high, and with a miraculous image of the Virgin. The lower town, the seaport proper, is newer, more populous, and more lively, inhabited chiefly by merchants, mariners, and fishermen. It contains the barracks, the great hospital, the theatre, the museum and gallery of art, and many elegant residences. Boulogne has a college, several schools, English as well as French, and a public library of 55,000 volumes; there are extensive and excellent salt-water baths; and, on account of its fine sands, it is a favourite, though somewhat expensive resort for sea-bathing. The English residents have recently become much less numerous. Pop. (1872) 39,700; (1891) 45,205, actively engaged in the manufacture of linen, cordage, iron, steel pens and buttons, oil, soap, and chemical products. Boulogne is the chief station in France of the North Sea fisheries. It has an active coasting trade, and ranks with Calais as one of the nearest and most frequented places of passage between France and England, steamers plying daily to London, which they reach in from 9 to 16 hours, and twice a day to Folkestone, which they reach in about 2 hours. Paris is reached by railway in 4½ hours. About 5000 vessels, most of them English, of over 1,000,000 tons burden, enter or clear the port annually, their cargoes representing a value of some £20,000,000. The principal imports are woollen, cotton, and silk material; the exports are manufactured fabrics, leather, and wine. The harbour of Boulogne is too shallow for large ships of war, although it has been repeatedly enlarged and improved. A large wet-dock was completed in 1872; and a new deep and extensive outer harbour was constructed in 1878-95, at a total cost of little less than £1,000,000. The blue clay cliffs have been cut away, and a solid sea-wall built of the stone and soil; and the works, which have been steadily pushed forward, include outer moles or breakwaters with a length of over 4400 yards, and an inner mole or traverse, 1200 yards long and 200 wide, alongside which steamships may lie at all states of the tide. The whole French navy could find a haven in this harbour, where the largest ships will be able to lie at anchor even at low-water, an advantage hitherto enjoyed by only the military ports of Brest and Cherbourg. Boulogne was known to the Romans as *Portus Gesoriacus*, but after the time of Constantine the Great, it was called *Bononia*, and after that of the Carolingians, *Bolonia*. In 1435 it came into the possession of the Duke of Burgundy, and was

united with the crown of France by Louis XI. in 1477. The town was taken by the English in 1544, and restored to the French in 1550. From this point has been contemplated every invasion of England since the days of Caligula; and here Napoleon encamped 180,000 men and collected 2400 transports, ready at any favourable moment to swoop down on the shores of Britain: but after months' watching, the war with Austria created other employment for them. As a memorial of this great camp, a tall marble column was erected on the higher grounds, and in 1841 surmounted by a colossal statue of Napoleon. In 1840 Boulogne was the scene of one of the adventurous expeditions of Louis Napoleon, who was imprisoned in the citadel. The poets Churchill and Campbell, and Le Sage, the author of *Gil Blas*, died here. Of late years, from its accessibility to English tourists, and rapid railway transit to Paris, Boulogne has greatly superseded Calais as a place of debarkation. See Merriew's *Boulogne-sur-Mer* (Lond. 1882).

Boulton, MATTHEW, a celebrated English engineer, was born 3d September 1728, at Birmingham, where his father had made a considerable fortune as a silver stamper and piercer. On his death in 1759, Matthew carried on the business of the manufactory with great energy, and extended it by the purchase of a piece of land, then a barren heath, at Soho, near his native town, his works there being opened in 1762. Here he improved not only the workmanship, but the artistic merit of his work. One of his first inventions was a new mode of inlaying steel. He entered into partnership with James Watt (q.v.), who had obtained a patent for the great improvements in the steam-engine which have immortalised his name, and they established a manufactory of steam-engines in 1769. After eighteen years of anxious labour, this department of the business began to be remunerative. They jointly contributed also to the improvement of coining machinery, and so to the perfection of the coinage itself. It was only in 1882 that a Boulton press, at the Mint, Tower Hill, was finally discarded. Boulton obtained a patent in 1797 for his method of raising water by impulse. Boulton died at Soho, 18th August 1809. His long life was devoted to the promotion of the useful arts and of the commercial interests of his native country. He was a Fellow of the Royal Society, and member of the Lunar Society, and was on terms of friendship with the chief scientific and literary men of his time; he was a man of extremely pleasing conversation, and of a most generous disposition. See Smiles's *Lives of Boulton and Watt* (1865).

Bound, or BOUNDARY, the utmost limits of land by which the same is known and can be described. These are recognised in various ways—e.g. by a line of march stones, a hedge, a ditch; by reference to possession of tenants; by reference to a plan; by measurement. The plan is the safest, because least ambiguous, boundary. A boundary-fence generally belongs equally to the two neighbours. A boundary by the sea gives property in the fore-shore (see BOUNDING CHARTER). The boundaries of towns depend in many cases on those of a grant of lands or jurisdiction anciently made to the town. The Reform Acts of 1832-33, 1867-68, and 1884-85, or commissions acting under them, defined political boundaries, but these are in many cases different from the municipal boundaries. In Scotland, statutes passed in 1857 and 1861 provide a simple mode of extending boundaries of burghs, provided the inhabitants in the outside districts substantially assent. Where a police-burgh in Scotland, or a local-board district in England is formed, the presiding authority defines a boundary, which

is publicly recorded. There is no survey of Scotland for administrative purposes, hence the boundaries of parishes and counties are nowhere laid down and recorded by public authority, except in the case of parishes erected under Graham's Act for church purposes. The boundaries of a parish are ascertained by the private boundaries of the estates lying within it. It is often doubtful, however, to which parish lands really belong. To avoid poor-law disputes on this point, it has been suggested that the Ordnance Survey (which was based on hearsay information) should be made conclusive evidence of parochial boundaries.

Bounding Charter, in the Scots law, is a charter which describes the lands by their boundaries. It gives right to everything within the bounds, but it prevents the acquisition by possession of any piece of property outside the bounds, even although the charter contains a clause of parts and pertinents. This rule, however, does not apply to servitudes, which can be acquired beyond the limits of a bounding charter, nor to such an incorporeal right as salmon-fishing. If the boundary be the sea or the seashore, the right is extended or limited as the sea permanently recedes or advances. If, again, it be a stream, the property may be subject to alteration, either extended by Alluvion (q.v.), or the gradual and imperceptible variation of the channel; or the stream may cease to be the boundary, in consequence of some violent change. But if the property described in the charter is bounded by walls, the walls, as a general rule, will not be held as included in the grant; and where it is intended that a wall is to be mutual, this must be expressed. When the grant is described both by boundaries and by measurement, the boundaries determine its extent, although containing a larger quantity of ground than the measurement. See CHARTER, CONVEYANCE, GRANT, and TITLE.

Bounds, BEATING OF THE, or *Perambulation*, the popular expression in England for those periodical surveys or perambulations by which the ancient boundaries of parishes used to be preserved, and which in many respects resembled the old Roman *terminalia*, celebrated every year on February 23, the last month of the year. On Holy Thursday or Ascension-day, the clergyman of the parish, with the parochial officers and other parishioners, followed by the boys of the parish school, headed by their masters, used to go in procession to the different parish boundaries, which boundaries the boys struck with peeled willow-wands that they carried in their hands. Sometimes the boys were whipped at important points 'to make them remember.' At Shrewsbury the bounds-beating was called Banner-ing, and was kept up annually till the middle of the 19th century. At Ludlow it still retained its religious character in 1822. For an account of the ceremonies, see Brand's *Popular Antiquities*, under 'Rogation Week and Ascension Day.' The custom is not confined to England. See Mackenzie Wallace's *Russia*.

Bounty, a term applied to any sum granted by the legislature towards creating or encouraging some kind of undertaking believed to be of national importance. At one time the system of granting such bounties was very prevalent, and it still continues in some countries. There were bounties on the tonnage of vessels employed in the herring and whale fisheries; on the importation of materials of manufactures; on the importation of indigo from the colonies; on the exportation of Irish and Scotch linen. That this system was a costly and factitious process for fostering commerce, manufactures, and agriculture was ably contended by Adam Smith in his *Wealth of Nations* (1776). With regard to the herring-fishery in particular, the drift of his

remarks is to show that in consequence of the bounty the herrings cost more to the government than the price they fetched in the market. The bounty on linen, which was not abolished till 1830, had before that time averaged £150,000 a year. The bounty on the exportation of grain from England, abolished in 1814, had for some years averaged £160,000. The French still give bounties to encourage their cod-fishery on the Banks of Newfoundland, and to stimulate the building and running of ships, both of iron and wood. In 1881 the French bounties on shipping amounted to £400,000. In 1888 the Argentine Republic granted a bounty on the export of live cattle and preserved meat. The most important form of the existing bounty system, however, is that on sugar, which prevails in Germany, France, Austria, Holland, and Belgium. The bounty on sugar is not a direct one, but is paid on the principle of returning on exportation the sum charged as inland duty. In consequence of mechanical improvements, the quantity of sugar actually extracted from the beetroot is greater than the estimated yield on which duty is paid. Thus the government paid as drawback a sum greater than what it received as revenue, and, accordingly, spends a considerable amount in artificially encouraging the production of sugar. The annual average of sugar bounties in 1887 was in France about £600,000, in Belgium £170,000, in Holland £150,000. This state of things having been found unsatisfactory, a conference of European powers on the bounty system was held in London in 1887-88; and the governments represented accepted the view that the bounty system ought to be abolished by levying duty on sugar as it goes into consumption. The bounty designed to stimulate exportation must be distinguished from the Drawback (q.v.), meant to put in a fair position for exportation those commodities more heavily taxed at home than abroad. See FREE TRADE.

An annual grant of £2000 to the Church of Scotland for mission purposes is called the Royal Bounty. Another annual grant called the Royal Bounty has long been given in Britain for improving the breed of horses. It has been generally expended in prizes at race meetings; but a Royal Commission in 1887 recommended that it should be given in prizes for thoroughbred stallions at horse-shows. The name Queen's Bounty is popularly given to a charitable donation bestowed on the mother of triplets. For Queen Anne's Bounty, see that article.

Bounty is also the familiar name for the sum of money given to induce men to enter the army or navy. In time of peace, when there is little or no need to augment the forces, the bounty sinks to a minimum; but in cases of exigency, it is raised according to the difficulty and urgency of the circumstances. In the British army, no bounty was paid to recruits until the nineteenth century; the temptations offered to them, if any, were of some other character. The highest bounty ever paid during the great wars against Napoleon was in 1812, when it amounted to £18, 12s. 6d. for limited service, and £23, 17s. 6d. for life; but these sums were subject to many unfair and absurd deductions; and even so late as 1849, when the bounty to an infantry recruit was nominally £4, he received little more than one-eighth of that amount. In 1855 the bounty was £7 per head (for line infantry); in 1856, only £2; in 1858, £3; and it afterwards underwent further changes. It was always higher in the cavalry and artillery than in the infantry, and higher in Highland than other line regiments, on account of matters connected with dress and personal ornaments. It was supposed that recruits were tempted more by immediate bounty than by prospective pay and

pensions; so that while the rate of bounty varied frequently, that of pay and pensions underwent little change. For some time it was customary to offer a bounty to men belonging to a regiment ordered home from abroad in order to induce them to continue there; and in 1887 a bounty of £2 was offered to men who prolonged their service with the colours. The name is now in use in the militia for the £2 a year given to each efficient man who enters what is called the 'Militia Reserve,' and thereby renders himself liable to service in the ranks of the regular army if required. The term bounty is also used in the navy to signify the distribution of money made to the officers and crews on particular occasions of active service. See BOOTY, PRIZE, SALVAGE.

Bounty, in the United States, is a term for grants of land to soldiers and sailors, their widows and children, for services in the army and navy. It is also applied to sums of money paid by government to owners of fishing-vessels, by Act of Congress of July 29, 1813, for the encouragement of that industry, and to sums of money appropriated by different state legislatures for the destruction of wild beasts and destructive birds, when the country was comparatively new and sparsely settled. The amounts now paid to companies and corporations which carry the mails by land and water have been called bounties, but are more properly termed appropriations for carrying the mails. See PENSIONS.

Bounty, MUTINY OF THE. See PITCAIRN'S ISLAND.

Bouquetin. See IBEX.

Bourbaki, CHARLES DENIS SAUTER, French general, born at Pau, 22d April 1816, entered the army in 1836, and fought in the Crimea and Italy. In 1870 he commanded the Imperial Guard at Metz, from whence he was sent to England, on a secret mission to the empress. Under Gambetta he organised the Army of the North, and commanded the Army of the Loire. His attempt to break the Prussian line at Belfort, though ably conceived, ended in disastrous failure; in a series of desultory attacks on a much inferior force, January 15-17, 1871, he lost 10,000 men. In the wretched retreat to Switzerland that followed on the 27th, reduced to despair by the ill-success of his plans, he attempted to commit suicide. From 1873 to 1879 he commanded the 14th Army Corps at Lyons, and in 1881 he retired from active service.

Bourbon, a French family which for several generations occupied the thrones of France and Naples, and still rules in Spain. It derived its name from the castle and seigniorship of Bourbon, in the former province of Bourbonnais, in the centre of France. The first member of the family recorded in history was Adhèmar, sire or lord of Bourbon, at the beginning of the 10th century, who traced his descent from the illustrious Charles Martel. After several changes the seigniorship of Bourbon devolved upon an heiress, who in 1272 married Robert, the sixth son of Louis IX. of France, and the name and possessions of the house thus passed to a branch of the royal family of the Capets, under whom it was converted into a duchy. From this Robert sprang two lines, an elder and a younger. The elder line had many eminent representatives among the nobles of France, but ended with the famous Constable of Bourbon, who in 1523 was deprived of his possessions and dignities for allying himself with Charles V. against his own country.

A representative of the younger line inherited the possessions of the Constable, and was raised to the dukedom of Vendôme. His son, Antoine, obtained by marriage the throne of Navarre, and Antoine's son was the famous Henry of Navarre, who in 1589, on the extinction of the male line of

the House of Valois, fell heir to the crown of France. Among the many collateral and less eminent branches of the Bourbon house among the French nobility may be mentioned those of Montpensier, Condé, Conti, and Soissons. Only a few members of the collateral lines, however, have actually borne the name of Bourbon; for example, the Cardinal Charles de Bourbon, Duke of Vendôme, who, under the name of Charles X., was set up by the Catholic League as a rival king to Henry IV. The ducal dignity was revived by Louis XIV. in the House of Condé, so that the eldest son of that house should bear the title of Duke of Bourbon.

Main Line of the House of Bourbon.—As we have seen, the male line of the Valois branch of the French royal family died out in 1589, and Henry of Navarre of the Bourbon line became king of France as Henry IV. On his assassination in 1610 he left, by his second wife, Mary de' Medici, five legitimate children: (1) Louis XIII. (q.v.), his successor on the throne; (2) J. B. Gaston, Duke of Orleans (q.v.), who died in 1660, and left no male heirs; (3) Elizabeth, married to Philip IV. of Spain; (4) Christina, married to Victor Amadeus, afterwards Duke of Savoy; (5) Henrietta, married to Charles I. of England.—Louis XIII., on his death in 1643, left two sons by his queen, Anne of Austria: (1) Louis XIV. (q.v.), his successor; and (2) Philip, who received from his elder brother the title of Duke of Orleans, and was the founder of the family which has become the younger Bourbon dynasty.—The Dauphin Louis, styled Monsieur, the son of Louis XIV. by his marriage with Maria Theresa of Austria, died in 1711, and left three sons by his marriage with Maria Anna of Bavaria: (1) Louis, Duke of Burgundy; (2) Philip, Duke of Anjou, who afterwards became king of Spain, as Philip V.; (3) Charles, Duke of Berri, who died in 1714.—Louis, Duke of Burgundy, died in 1712. By his wife, Maria Adelaide of Savoy, he had three sons, of whom two died in early youth, the only one who survived being Louis XV., who succeeded his great-grandfather, Louis XIV., in 1715.—Louis XV. having married Maria Leszcynska, daughter of the dethroned king Stanislaus of Poland, had by her a son, the Dauphin Louis, who married Maria Josepha of Saxony, and died in 1765, leaving three sons: (1) Louis XVI. (q.v.), who succeeded his grandfather, Louis XV., in 1774; (2) Louis Stanislaus Xavier, Count of Provence, afterwards Louis XVIII.; (3) Charles Philippe, Count of Artois, afterwards Charles X.—Louis XVI. had three children by his queen, Marie Antoinette of Austria: (1) The Dauphin Louis, who died in 1789; (2) Louis, called Louis XVII. (q.v.), who died in 1795; (3) Maria Therese Charlotte, styled Madame Royale, afterwards Duchesse d'Angoulême (q.v.).—Louis XVIII. had no children; but Charles X. had two sons: (1) Louis Antoine de Bourbon, Duke of Angoulême (q.v.), who was dauphin prior to the Revolution of 1830, and died without issue in 1844; (2) Charles Ferdinand, Duke of Berri (q.v.), who was assassinated in 1820. The Duke of Berri left two children: (1) Marie Louise Therese, styled Mademoiselle d'Artois, married to the Duke of Parma; (2) Henry Charles Ferdinand Marie Diendonné, Duke of Bordeaux, styled Count de Chambord (q.v.); he died childless in 1883, when the Legitimists of France accepted in his room the Orléanist Comte de Paris as head of the House of Bourbon.

Orleans Branch.—As already stated, the founder of the Orleans or younger branch of the Bourbon royal family of France, was Philip, Duke of Orleans (q.v.), the only brother of Louis XIV. He died in 1701, leaving, by his second marriage with Elizabeth Charlotte of the Palatinate, a son of his

own name as his heir, who was Regent of France during the minority of Louis XV. His son, Louis-Philippe, Duke of Orleans (born 1703), married a princess of Baden, and died in 1752, leaving an only son of his own name, whose son and heir was that Louis Joseph Philippe, Duke of Orleans (q.v.), so notable in the French Revolution, who in 1792 renounced his rank, taking the name of Citizen Egalité, and died by the guillotine in 1793. He left four children: (1) Louis-Philippe, who, before the Revolution, was styled Duke of Chartres—that being the ordinary title of the eldest son of the Orleans family—became afterwards Duke of Orleans, was king of the French from 1830 to 1848, and died in England, 1850; (2) the Duke de Montpensier, who died in England in 1807; (3) the Count de Beaujolais, who died at Malta in 1808; (4) Adelaide, styled Mademoiselle d'Orleans, born 1777, died 1847.—Louis-Philippe left a numerous family by his queen, Amelia of Naples; but his eldest son, Ferdinand, Duke of Orleans, lost his life by an accident in 1842, leaving by his wife, the Princess Helen of Mecklenburg-Schwerin, two sons, the eldest of whom, Louis-Philippe, styled Count of Paris, was at his death (1894) the representative of the Orleans family, and head of the House of Bourbon. His son Louis-Philippe Robert was already known as Duke of Orleans. As pretenders to the throne, the chiefs of the Orleans family were expelled from France in 1887. See the article LOUIS-PHILIPPE, the articles on the kings of this family, the works quoted at FRANCE, and the family history by Coillier de Moret (2 vols. 1824).

Spanish Branch.—The Spanish branch of the House of Bourbon was founded by Philip, Duke of Anjou, grandson of Louis XIV. He ascended the Spanish throne in 1700 as Philip V. Philip V. was succeeded on the Spanish throne by his son, Ferdinand VI., who died without issue in 1759, and the crown fell to his brother, Charles III., whose son and successor, Charles IV., was compelled to resign it in 1808 in favour of a successor nominated by Napoleon, and died at Naples in 1819. The two eldest sons of Charles IV. by his marriage with Maria Louisa of Parma were—(1)

Don Fernando, Prince of Asturias, who, after the overthrow of Napoleon, reigned as Ferdinand VII. (q.v.), whose eldest daughter was Isabella II., the mother of Alfonso XII.; (2) Don Carlos, who, on the death of his elder brother in 1833, became pretender to the Spanish throne (see CARLOS). Isabella II., who succeeded in 1833, was expelled in 1868; but the Bourbon line was in 1874 restored to the throne of Spain in the person of Alfonso XII. On his death in 1885 his daughter Maria reigned till the birth of a posthumous son, Alfonso XIII., in 1886. See SPAIN.

Neapolitan Branch.—On the elevation of Philip of Anjou to the throne of Spain, Naples and Sicily, which till that time had been Spanish possessions, were transferred to Austria. By the Peace of Vienna in 1738, however, a younger son of Philip V. became king of Naples and Sicily, under the name of Charles III. Upon his accession to the throne of Spain in 1759, he gave up that of Sicily to his third son, Don Fernando, called Ferdinand IV., with the express stipulation that it should never again be occupied by a king of Spain. Ferdinand IV. was compelled to yield to the French arms in 1806; but after the overthrow of Napoleon he became king of the Two Sicilies as Ferdinand I. (q.v.). His son, Francis I., left the throne in 1830 to his son, Ferdinand II. (q.v.), whose son, Francis II., was expelled in 1860, when Naples was incorporated with the new kingdom of Italy. See NAPLES.

Parmaese Branch.—By the peace of Aix-la-Chapelle in 1748, Austria made over the duchies of Parma and Piacenza to Don Philip, the youngest son of Philip V. of Spain. Except during the interval 1814–47, when the duchies were assigned to Marie Louise of Austria, second wife of the first Napoleon, Parma and Piacenza were under Bourbon rulers till 1859. In that year they were incorporated with the new kingdom of Italy. See ITALY and PARMA; and see Coillier de Moret, *Histoire du Bourbonnais* (1828); Achaintre, *Histoire de la Maison de Bourbon* (1825); Bingham, *The Marriages of the Bourbons* (1889); also histories by Mure (Paris, 1860–68) and Dussieux (1869).

THE HOUSE OF BOURBON.

Henry IV., died 1610.

Louis XIII., died 1643.

Louis XIV., died 1715.

Louis, Grand-dauphin, died 1711.

Louis, Duke of Burgundy, died 1712.

Louis XV., died 1774.

Louis, Dauphin, died 1765.

Louis XVI., died 1793.

Louis XVIII., died 1824.

Charles X. (Comte d'Artois), died 1836.

Charles Louis (Louis XVII.), died 1795.

Louis Antoine, Duc d'Angoulême, died 1844.

Bourbon, CHARLES, DUC DU BOURBONNAIS, styled CONSTABLE DE BOURBON, born 1490, was the son of the Count of Montpensier. Through the death of his elder brother, and his marriage with the only daughter of the Duke of Bourbon, he united in his own hands the vast estates of both

Philip, Duke of Orleans, died 1701.

Philip, regent, died 1723.

Louis, died 1752.

Louis-Philippe, died 1785.

Louis-Philippe (Egalité), executed 1793.

Louis-Philippe, king 1830–48; died 1850.

Philip, Duke of Anjou, died 1746.

Charles III. of Spain, died 1788.

Charles IV., died 1819.

Ferdinand I., died 1825.

Infante Gabriel, died 1788.

Elder Spanish Branch.

Branch of the Two Sicilies.

Junior Spanish Branch.

Ferdinand, died 1842.

Louis-Philippe, Comte de Paris, died 1894.

Robert, Duc de Chartres.

Philippe, died 1765.

Parma Branch.

Louis, Duc de Nemours.

François, Prince de Joinville.

Henri, Duc d'Aumale.

Antoine, Duc de Montpensier.

Louis, Comte d'Eu.

these branches of the Bourbon family. His great ability, bravery, and large possessions soon made him the first subject of France. For his exploits at the battle of Marignano in 1515 he was raised to the rank of Constable of France and governor of Milan. But at the French court there was a strong

party that sought to undermine him in the favour of the king, Francis I. It is said that they were assisted in their intrigues by the widowed mother of Francis, because Bourbon, himself then a widower, had refused her hand. In this way Bourbon was threatened with the loss of the lands brought him by his wife, and of many of his other dignities. Deeply injured, he renounced the service of France, and concluded a private alliance with the Emperor Charles V., and with Henry VIII. of England. The former agreed to give him in marriage his sister, Eleonora, who had Portugal as her jointure, and to make an independent kingdom for him of Provence and Dauphiné, with his own possessions of the Bourbonnais and Auvergne. The king, who was engaged in an expedition to Italy, received intelligence of this conspiracy, and proceeding in person to the Constable, offered him restoration to favour and also of his estates. The Constable, however, did not trust him, but fled in disguise from France in 1523. In order not to appear as a fugitive to the Spanish army, which awaited him in Lombardy, he drew around him a force of German mercenaries, and soon contrived to gain their entire attachment. He took the field in 1524 against his own country, and invaded France, but failed at the siege of Marseilles. In the following year, however, he contributed to the great victory of Pavia, in which Francis I. was taken prisoner by the Spaniards. But the victory did nothing to restore Bourbon to his old position. Charles V. distrusted him, and his interests were not considered in the treaty of peace between France and Spain in 1526. He was, however, made Duke of Milan by Charles, and appointed Spanish commander in Northern Italy. Along with George of Frundsberg he led the mixed army of Spanish and German mercenaries that stormed and plundered Rome in 1527. Bourbon fell in the fierce struggle by which the fortifications were carried. Resolved to conquer or die, he led his troops in the most impetuous manner, and with his own hands eagerly seized a scaling-ladder, in order to make his way over a weak place of the walls, when he was mortally wounded by a bullet, which Benvenuto Cellini afterwards asserted that he had shot. For a time his death was kept secret from the storming army under his command. When the army departed from Rome two months after, his corpse, which the soldiers would not part with, was taken with them, and buried at Gaeta, under a magnificent monument, which, however, was afterwards destroyed.

Bourbon, ISLE DE. See RÉUNION.

Bourbonnais, a gently undulating, terraced-formed district in the centre of France, northward of the high lands of Auvergne, abounding in grain, fruits, wine, iron, marble, and mineral springs. From 1327 to 1523 it formed the duchy of Bourbon, and afterwards, becoming a domain of the crown, it formed a separate province of France. It now constitutes the department of Allier and part of the department of Cher. The capital was Moulins.

Bourbonne-les-Bains, a town in the French department of Haute-Marne, 29 miles ENE. of Langres. From June to October it is much visited for its saline springs, which reach a temperature of over 130° F., and are efficacious for rheumatism, wounds, scrofulous affections, and digestive ailments. Pop. 3766.

Bourboule, a bathing resort in the French department of Puy de Dome, on the Dordogne, with springs of 88°-129° F., recommended in scrofulous, nervous, and rheumatic affections. Pop. 1127.

Bourdalone, LOUIS, one of the greatest pulpit orators of France, was born at Bourges, 20th August 1632. At sixteen he entered the

order of the Jesuits, and afterwards filled in succession the chairs of Rhetoric, Philosophy, and Moral Theology in the Jesuit College of his native place. But his remarkable powers of eloquence determined his superiors to employ him as a preacher. Disdaining the inflated and theatrical style prevalent among the pulpit orators of his time, he assailed with fearless vigour and simple earnestness the passions, weaknesses, and errors of men. The dignity of his manner and the fire of his eloquence made him famous even when the public mind was occupied with the festivities of Versailles, the victories of Turenne, and the literary masterpieces of Corneille and Racine. At the court of Louis XIV. he was remarkably well received. The year after the revocation of the Edict of Nantes, he was sent to Montpellier to bring back the Protestants to the Roman Catholic Church. The orator understood how to accommodate his eloquence to the minds of those whom he addressed. Simple among the simple, a dialectician among ecclesiastics, he was equally a favourite with the common people and with the learned and the great. He was also much esteemed and beloved as a man, and bore throughout his life a high reputation for candour and honesty. In the later years of his life he relinquished the pulpit, and devoted his time to hospitals, prisons, and pious institutions. He died at Paris, 13th May 1704. The best edition of his sermons was edited by Bretonneau (16 vols. 1704-37). A recent edition is that published in 6 vols. at Lille in 1882. See *Lives* by Lauras (1881) and Feugère (1888).

Bourdon de l'oise, FRANÇOIS LOUIS, was born in the middle of last century at Saint Remy, near Compiègne. He was a fanatical revolutionist, took an active part in the storming of the Tuileries on 10th August 1792, and under a false name obtained a seat in the Convention. Bourdon contributed to bring about the execution of Louis XVI. and the destruction of the Girondists. In La Vendée, however, he objected to the cruelties of the extreme party, and thus became suspected by the followers of Robespierre, whom he helped to overthrow in 1794. From that time he inclined more and more to the moderate or even royalist party, till in 1797 the Directory had him proscribed and transported to Cayenne, where he died soon afterwards.

Bourgas. See BURGAS.

Bourgelat, CLAUDE, veterinary surgeon, was born in Lyons in 1712, and died there in 1799. An ex-cavalry officer, he in 1761 founded (at Lyons) the first veterinary school, and students flocked to it from all parts of Europe. Its success induced the government to establish similar institutions, and Bourgelat was chosen to superintend that at Alfort, near Paris, which became the most celebrated school in France. Bourgelat wrote with authority on farriery.

Bourg-en-Bresse, the chief town of the French department of Ain, on the Reyssouze, at the junction of five railways, 23 miles SE. of Mâcon, and 37 miles NE. of Lyons. The church of Notre-dame de Brou here was built by Margaret of Austria in 1505-36, and contains a superb monument to Philibert of Savoy. Bourg manufactures artificial mineral waters and pottery, and has a brisk trade in corn, wine, poultry, and horned cattle. Here were born Lalande and Edgar Quinet, and in the Place de Grenette stands a statue to Bichat. Pop. (1872) 12,912; (1891) 17,716.

Bourgeoisie, a French term, originally denoting the citizens of towns as a rank or class of society as opposed to the nobility and the working-classes proper. The French communists and socialists (especially since Saint-Simon) have

widened its significance to express the more or less comfortable middle-class as opposed to the working-class and the proletariat; and, moreover, invariably read into the name a one-sided, narrow-hearted, and selfish devotion to the interest of capital as against labour.

Bourges, the capital of the French department of Cher, situated in a fertile plain at the confluence of the Auron and the Yèvre, 144 miles S. of Paris, and 69 SSE. of Orleans. Bourges is divided into an old and new town, the latter being built round the former. Its houses are of antique architecture, and its streets crooked and dirty. It was formerly surrounded by ramparts flanked with high towers, some of which still remain; but the ramparts have been converted into promenades. The cathedral (1220-1538) is a splendid Gothic edifice, the interior one of the noblest in France, being 405 feet long and 117 high. The sculptures of the west façade are admirable, and there is some very good stained glass. A university (1465) was suppressed at the Revolution. The hôtel-de-ville, begun by Jacques Cœur in 1443, is in the florid style of that century. Bourges has prospered since the era of railway communication, and has some trade in hemp, grain, cloth, leather, wool, and cattle. Brewing is carried on, and there are nurseries in the suburbs. Chosen in 1861 to be one of the military arsenals of France, Bourges has a cannon foundry, and has greatly increased in strategical importance since the loss of Metz. Pop. (1872) 27,377; (1891) 41,224. Bourges is of great antiquity, being the *Avaricum* of the Gauls, in the country of the *Bituriges Cubi*. Taken by Caesar in 52 B.C., it became the capital of the Roman province of *Aquitania Prima*, and in the middle ages, of the province of Berri. Charles VII. had his residence at Bourges, when almost all France had been taken from him by the English. Louis XI. was a native, as was also the great preacher Bourdaloue. Several important ecclesiastical synods were held at Bourges.

Bourget, LE, a village 6½ miles NE. of Paris by rail, during the siege of the capital in 1870 the scene of a series of bloody struggles disastrous to the French, of which the most important were those of 30th October and 21st December.—The Lac du Bourget, the largest wholly French lake, in the department of Savoie and the basin of the Rhone, lies 780 feet above sea-level, and measuring 7½ by 3 miles, has an area of 16 sq. m.

Bourget, PAUL, an eminent French novelist, was born at Amiens, September 2, 1852. After a brilliant course at the Lyceum of Clermont-Ferrand, where his father was professor of Mathematics, and the college of Sainte Barbe, he graduated with the highest honours in 1872. His early distinctions pointed to an academical career, but the spell of literature proved too strong. He began to write in 1873, but it was ten years ere he found his true work, though he contributed the while numerous articles to the magazines, and published as many as three volumes of striking verse: *La Vie Inquiete* (1875), *Edel* (1878), and *Les Arcs* (1881). His *Essais* (1883) was the first indication of his strength. The second series, *Nouveaux Essais de Psychologie contemporaine* (1886), was a singularly subtle and searching inquiry into the causes of pessimism in contemporary France. Bourget's first novel, *L'Irreparable* (1884), was followed by *Cruelle Énigme* (1885), *Un Crime d'Amour* (1886), *André Cornelis* (1887), and *Mensonges* (1887). The keen insight into the hidden springs of human motive, and the marvellous subtlety of psychological analysis in these stories, together with their clearness and refinement of style, have lifted Bourget into the front rank of contemporary French novelists. His intimate knowledge of English and

Italian life, and his travels in Spain and Morocco, gave him the materials for *Sensations d'Italie* (1891) and *Cosmopolis* (1892); and he recorded his impressions (1894) of travel in the United States. Other novels are *Le Disciple*, *Notre Cœur*, *La Terre Promise*, and *Un Saint*. Their author was admitted to the *Académie* in 1894.

Bourignon, ANTOINETTE, a celebrated religious visionary, born at Lille, 13th January 1616. Her intellect was very acute, and its powers were early developed; and soon she fancied she saw visions, conversed with God, received special revelations, and was called to restore the pure spirit of the gospel. At the age of twenty she fled from home in male disguise, fell into the hands of a soldier from whom she was rescued, and by the good offices of the Archbishop of Cambrai obtained admission into a convent, where she won over some of the nuns to her opinions. She afterwards had charge of a hospital at Lille, but from this position she was driven to Ghent (1662) in consequence of her extravagant fancies. She now travelled to gain proselytes, and for a time was head of a hospital in East Friesland. She died at Franeker, 30th October 1680. According to Madame Bourignon, religion consists in internal emotion, and not in either knowledge or practice. Her own character exhibited a strange combination of pride and avarice, with a sort of mystic piety. Among the chief expounders of Bourignonism, as this form of mysticism was called, was Peter Poiret, a Calvinistic minister. It spread to a remarkable extent, and about the beginning of the 18th century prevailed so much in Scotland that a solemn renunciation of it was demanded from every entrant on the ministry at his ordination. The works of Madame Bourignon were edited by Poiret (25 vols. Amsterdam, 1676-84; 2d ed. 1717). There are English translations of her *Light of the World* (1786), *Treatise of Solid Virtue* (1699), and *Restoration of the Gospel Spirit* (1707). They exhibit not a little fiery eloquence.

Bourmont, LOUIS DE GHAISSNES, COMTE DE, a French marshal, the conqueror of Algiers, was born in 1773 at his paternal castle of Bourmont, in Anjou. He went into exile at the Revolution, and from 1793 to 1799 was actively engaged in the anti-revolutionary struggle in La Vendée. Subsequently, he obtained the favour of Napoleon, and for his brilliant services in the campaigns of 1813-14 was promoted to the rank of general. In March 1814 he declared for the Bourbons; yet, on Napoleon's return from Elba, he went over to him, only once more to desert on the eve of the battle of Ligny, and to betake himself to Louis XVIII. at Ghent. His evidence went far to bring about Ney's execution. He was appointed minister of war in 1829, and in 1830 received the command of the expedition against Algiers, whose rapid success was ascribed to his prudence and energy. For this he received the marshal's baton, but on the July revolution he was superseded, and went to England to share the exile of Charles X. Refusing to take the legal oath, he was struck off the lists of the French army and peerage in 1832. In 1833 Dom Miguel of Portugal placed him at the head of his troops, but the campaign was brief and unsuccessful. Bourmont finally settled on his estate in Anjou, and died there 27th October 1846.

Bourne, HUGH, the founder of the sect of Primitive Methodists (q.v.), was born 3d April 1772, at Fordhays, parish of Stoke-upon-Trent, Staffordshire, and died at Bemersley, 11th October 1852. At first an assistant to his father, who was a farmer and wheelwright, and to an uncle, he became a preacher among the Wesleyan Methodists. His zeal for large open-air meetings, carried on on

one occasion from six in the morning till eight at night, received no countenance from the leaders of the denomination to which he belonged; and in 1808 Bourne was cut off from the Wesleyan connection for continuing to hold camp meetings in defiance of the repeatedly and strongly expressed disapproval of the Wesleyan Conference. But his preaching was wonderfully acceptable, and he quickly gathered round him many devoted adherents. In March 1810 a committee of ten members was formed at Standley, near Bemersley. This may be regarded as the first official organisation of the body which adopted the name Primitive Methodist in 1812; by the people they were sometimes called Ranters. Bourne and his brother founded the first chapel of the body at Tunstall in 1811. For the greater part of his life he worked as a carpenter and builder, but found time to visit Scotland, Ireland, and the United States. Amongst his writings was a *History of the Primitive Methodists* (1823).

Bourne, VINCENT, Latin poet, was born in 1695, from Westminster passed in 1714 to Trinity College, Cambridge, and after obtaining a fellowship in 1720, became a master in his old school. Such he remained till his death on 2d December 1747. Cowper, one of his pupils, expressed his 'love for the memory of Vinny Bourne,' and actually thought him 'a better Latin poet than Tibullus, Propertius, Ausonius, or any of the writers in his way except Ovid, and not at all inferior to him.' And Lamb, more happily, remarks: 'What a sweet, unpretending, pretty-mannered, matterful creature! Sucking from every flower, making a flower of everything. His diction all Latin, and his thoughts all English!' The best edition of his *Poemata* (1734) is that with a memoir by Mitford (1840).

Bournemouth, a town in Hampshire, a favourite health resort, on Poole Bay, 37 miles SW. of Southampton, and 116 of London. It is included within the parliamentary borough of Christchurch, from which it is 4 miles distant. Its rise has been rapid; until 1838 it consisted of but a few fishermen's huts and a coastguard station. It is situated for the most part in the pine-clad valley of the Bourne Brook, the banks of which are laid out as public gardens. The sands extend for about 3 miles from east to west. The climate is fine, the air soft without being relaxing, and the country around is beautiful. Two piers, one 800, the other 840 feet long, were erected in 1861 and 1879. Of several churches the finest is St Peter's (1864), by Street, with memorial windows to Keble, and the graves, in its churchyard, of Godwin, Mary Wollstonecraft, and Mary Shelley. Other buildings are a town-hall, a national sanatorium (1866), the Herbert Home for consumptives (1867), besides a home for incurables, a hip hospital, an aquarium and winter-garden, golf-course (1894), &c. Pop. (1861) 1940; (1871) 5906; (1881) 16,858; (1891) 37,650. The town was made a municipal borough in 1890. See works by Dobell (2d ed. 1886), Morgan (1889), and Bright (new ed. 1891).

Bouroudjird, a town of Persia, 190 miles NW. of Isfahan. Pop. 12,000.

Bourrienne, LOUIS ANTOINE FAUVELET DE, the secretary and early friend of Napoleon I., was born at Sens in 1769, and received his education in the military school at Brienne, where he formed the closest intimacy with the future emperor. In 1792 he became secretary to the embassy at Stuttgart. Deprived of this office through the breaking out of the revolutionary wars, he lived a retired life for some time, until in 1797 his former schoolfellow appointed him his secretary. He accompanied him to Italy and to Egypt, and in 1801 was nominated a councillor of state. In 1802

he was dismissed from his office for being implicated in the dishonourable bankruptcy of the house of Conlon, army contractors; but in 1804 he was appointed to a post at Hamburg. He was recalled on a charge of peculation, and had to refund 1,000,000 francs into the public treasury. He now decidedly joined the party which sought the overthrow of the emperor and the restoration of the Bourbons. After the return of the Bourbons in 1815, he sat for several years in the Chamber of Representatives, where he figured as an opponent of Liberalism. He was also for a short time minister of state. The revolution of 1830 and the loss of his fortune (occasioned by extravagance) caused his reason to give way, and he died in a lunatic asylum at Caen in 1834. His venomous memoirs on Napoleon, the Directory, the Consulate, the Empire, and the Restoration (10 vols. Paris, 1829; new ed. 1895 *et seq.*) are at best of doubtful authority. An *Histoire de Napoléon, Manuscrit de St Hélène*, &c., attributed to him are certainly spurious.

Bourse. See EXCHANGE.

Boussa, or BUSSA, a town of Central Africa, on an island in the Niger, in 10° 20' N. lat., is hemmed in by rocks and surrounded by walls. Pop. 10,000. Mungo Park (q.v.) perished here.

Boussingault, JEAN BAPTISTE, a French agricultural chemist, was born at Paris in 1802, and after a visit to South America, where he served as a colonel under Bolivar, became professor of Chemistry at Lyons, in 1839 was admitted into the Institute, and in 1857 was made commander of the Legion of Honour. His *Économie Rurale* (1844; Eng. trans. 1845) embodies the investigations which made him famous. Of four or five other works the most important is *Agronomie, Chimie agricole, et Physiologie* (7 vols. 1860-84). He died 12th May 1887.

Boustroph'edon. See ALPHABET, vol. i. p. 189.

Buterwek, FRIEDRICH, born in 1765 at Oker, near Goslar, was educated at Brunswick and Göttingen, where he held a chair of Philosophy from 1797, and died 9th August 1828. A poet first and romancist, he attached himself in philosophy to the system of Kant, but exchanged it presently for Jacobi's. But the work on which his reputation really depends is his *Geschichte der neuern Poesie und Beredsamkeit* (12 vols. 1801-19). The part relating to Spanish literature was translated into Spanish (1828) and English (1823).

Bouts-rimés (Fr., 'rhymed endings') are a kind of verse, the making of which forms a social amusement. Some one of the party gives out the rhymes or endings of a stanza, and the others have to fill up the lines as they best may. Suppose the rhymes prescribed are *wave, lie; brave, die*; the following are two of the ways in which the lines might be completed:

Dark are the secrets of the gulph	wave,
Where, wrapped in death, so many heroes	lie;
Yet glorious death's the guerdon of the	brave,
And those who bravely live can bravely	die.
Whenever I sail on the	wave,
O'ercome with sea-sickness I	lie;
I can sing of the sea, and look	brave;
When I feel it, I feel like to	die.

These were once very popular, especially in France, and endless ingenuity was wasted on 'this foolish kind of wit.' See No. 60 of the *Spectator*.

Boutwell, GEORGE SEWALL, an American statesman, born at Brookline, Massachusetts, 28th January 1818, was a member of the state legislature (1842-51), and governor of Massachusetts (1851 and 1852). Having joined the Republican party, in 1862 he organised the new department of internal revenue, and sat in congress from 1862 to 1869,

taking a leading part in the impeachment of President Johnson (1868). He was secretary of the treasury, 1869-73, and for two years after represented Massachusetts in the senate. Besides speeches, he has published *Educational Topics and Institutions* (1858), and works on United States Taxes (1863 and 1865).

Bouvardia, a Mexican genus of Rubiaceæ, sub-order Cinchonaceæ. *Bouvardia triphylla*, with oblong ternate leaves and beautiful corymbs of scarlet flowers produced from June to November, has obtained a place among the favourite ornaments of flower-borders in Britain, but requires careful protection from frost. To preserve it, the roots are generally taken up.

Bouvines, a village in the French department of Nord, 8 miles S.E. of Lille, the scene of the victory of Philip Augustus of France over the Emperor Otto IV. in 1214—commemorated by a monument (1863)—and of a series of struggles in 1794 between the Austrians under Kinsky and the victorious French army of the north.

Bovate (Lat. *bos*, 'ox') or OXGANG, an old English land-measure; as much as an ox can plough in a season—an area varying according to circumstances from 8 to 18, or sometimes even 24 acres. It was the eighth of a *carucate*.

Bovey Coal is a form of wood-coal or lignite, which derives its name from being found at Bovey, in Devonshire.

Bovidae, a family of even-toed, hollow-horned, ruminant, hoofed mammals (*Artiodactyla ruminantia*, *Cavicornia*). The sheep and antelope types form the other division of the same series. The Bovidae include the various varieties of ox (*Bos*), the buffalo (*Bubalus*), the Tibet ox (*Poephagus*), the bison, and perhaps also the more widely separated musk-ox (*Ovibos*). The limits or relative value of the different genera are somewhat doubtful, but there is no doubt that the distinctions between *Bos* and *Ovibos* are greater than those between *Bos* and any of the other genera or sub-genera. The term is sometimes used as equivalent to hollow-horned ruminants, but is here used (as equivalent to Bovine) to include those that remain after subtracting the sheep and antelope types (*Ovina* and *Antelopina*). The large compact hairy body, the short strong legs, the usually smooth and round curved horns, the broad snout and naked nostrils, the undivided upper lip, the absence of tear-pits and hoof-glands, the frequent dewlap, the four teats, and the more general characters of the replacement of upper front teeth by a fibrous elastic pad, of characteristic canon-bones (fused metacarpals and metatarsals), of complex stomach and cud-chewing ruminant habit, are familiar to most. In their wild state they are gregarious nomadic animals, swift of foot, eating hurriedly, masticating and digesting at leisure. They feed on grass and herbage, which seem to be collected by the tongue, held by the lower teeth, upper lip, and fibrous pad, and half bitten, half torn away by a quick movement. The hollow horns, occurring on both sexes, are formed from the skin, and simply based on a process of the forehead (frontal) bone; they obviously serve as weapons both against foes and rival fellows. The ancient and ancestral *Bos primigenius*, the numerous wild species such as Banteng and Gaur, the abundant varieties of domesticated cattle, the Asiatic Buffalo (*Bubalus buffelus*), the giant Arni (*Bubalus arni*), the wild and also domesticated Tibetan Yak (*Poephagus grunniens*), the ancient and still extant European Bison (*B. europæus*), the American Buffalo or Bison (*B. americanus*), are important forms in no way widely separated from the *Bos* type. But in

the Musk Ox (*Ovibos moschatus*) the very small naked portion of the snout and the short hair-covered tail are marked, though hardly important, differences. It is often included among the sheep and goats (*Ovina*). Altogether there are about thirteen modern species, widely distributed in Europe, Asia, Africa, and North America. Numerous fossil forms are known from the Pliocene upwards. The utility of these forms to man, both in their wild and in their domesticated states, is too well known to require statement. The flesh, the fat, the milk, the hair, the skin, the viscera, bones, horns, dung, &c. are in common use, and the animals themselves have in many cases become beasts of burden. See CATTLE, and other separate articles.

Bovino, a cathedral city of South Italy, 20 miles SSW. of the town of Foggia. Pop. 7388. The Imperialists defeated the Spaniards here in 1734.

Bow of a ship is the general name for the stem and fore-part, or that which cuts the water. The word is often used in the plural, the ship being considered to have starboard and port bows, meeting at the stem. Starboard is applied to the right-hand side, and port to the left-hand side, looking forward. A line or lean bow, and a full or broad bow, are seamen's phrases for different types; and the 'V form,' or 'U form,' is a nomenclature adopted by the naval architect to denote the character of a section of the bow. See SHIPBUILDING.

Bow and Arrow. See ARCHERY.

Bowdich, THOMAS EDWARD, African traveller, was born at Bristol 20th June 1791, for a year was a hatter in his native city, but in 1814 received a writership in the service of the African Company. Selected in 1816 to conduct a mission to the king of Ashanti, he succeeded in his difficult negotiation, and thus paved the way for commerce and the exploration of the interior. On his return to Europe (1818) he resided for some time in Paris, where he studied mathematics and other subjects to such purpose as to gain a valuable Cambridge prize. Aggrieved at his treatment by the African Company, he exposed their management in a volume which led the government to take over their possessions. In 1822 he sailed for Africa, and began a trigonometrical survey of the Gambia, where he died of fever, 16th January 1824. See his *Mission from Cape Coast Castle to Ashanti* (1819), and the narrative of his last voyage, edited by his wife (1825).

Bowditch, NATHANIEL, an American mathematician and astronomer, born 26th March 1773, at Salem, Massachusetts. He showed at a very early age a great inclination for mathematics, in which he afterwards made great proficiency without ever attending a university. He was at first bred to his father's trade of a cooper, and afterwards apprenticed to a ship-chandler. He acquired Latin that he might study Newton's *Principia*, and at a later period studied French, Spanish, Italian, and German. He particularly devoted himself to the study of the practical applications of science. Between 1795 and 1803 he acted in turn as clerk, supercargo, and master of a merchant-ship in five long voyages, and added a thorough practical acquaintance with navigation to a theoretical knowledge of it. His *New American Practical Navigator* (1802) was received with great favour. He published also an admirable translation of Laplace's *Mécanique Céleste* (1829-38), to which he added valuable annotations, and upon this achievement his fame chiefly rests. These works obtained for him marks of honour from scientific societies in Europe, and led to offers, which he declined, of the professorship of Mathematics and Astronomy in Harvard College (1808), the university of Virginia (1818), and

West Point (1820). In 1823 he became actuary of the Massachusetts Life Insurance Company, and was afterwards president of the Academy of Arts and Sciences in Boston, and a member of the corporation of Harvard College, from which he received the degree of LL.D. He died at Boston, 16th March 1838. See *Memoir* by his son (1839).

Bowdler, THOMAS, who has immortalised himself unhappily as the editor of the 'Family Shakespeare,' was born of wealthy parents at Ashley, near Bath, July 11, 1754. At sixteen, he went to St Andrews to study medicine, but graduated M.D. of Edinburgh in 1776, and after some years of travel, settled in London, devoting himself mainly to charitable work. He lived for ten years at St Boniface, Isle of Wight, and for the last fifteen years of his life at Rhyddings, near Swansea, where he died February 24, 1825. In 1818 Bowdler published 'The Family Shakespeare, in 10 vols.; in which nothing is added to the original text; but those words and expressions are omitted which cannot with propriety be read aloud in a family.' The work had a large sale, and was long popular, spite of the ridicule it brought down upon the head of its over-prudish editor, who has had the happiness or unhappiness to add permanently to the English tongue the word *bawdlerism* as a synonym for senseless expurgation. The last years of Bowdler's life were given to the task of preparing a purified edition of Gibbon's History, which was published in 6 vols. the year after his death, edited by his nephew, under the title: 'Gibbon's History of the Decline and Fall of the Roman Empire, for the use of Families and Young Persons, reprinted from the original text, with the careful omissions of all passages of an irreligious or immoral tendency.' In a note, the editor says that 'it was the peculiar happiness of the writer' to have so purged Shakespeare and Gibbon, that they could no longer 'raise a blush on the cheek of modest innocence, nor plant a pang in the heart of the devout Christian.'

Bowdoin, JAMES, an American statesman, of Huguenot descent, born in Boston in 1727, graduated at Harvard in 1745, was elected to the Continental Congress in 1774, but was unable to attend, and in 1785-86 was governor of Massachusetts. He published scientific papers, poems, &c.; referred, in a letter to Benjamin Franklin, the phosphorescence of the sea to animalcules; was F.R.S., LL.D., and in his honour Bowdoin College, at Brunswick (q.v.) in Maine, was named. He died in 1790.

Bowels. See ABDOMEN, COLIC, CONSTIPATION, DIARRHOEA, DIGESTION, DYSENTERY, ENTERITIS, HERNIA, INTUS-SUSCEPTION, PERITONITIS, TAPEWORMS, &c.

Bower, or BOWMAKER, WALTER, frequently spoken of as 'the continuator of Fordun,' completed the history of Scotland which is known as the *Scotichronicon*, and which was begun by Fordun. Not much is known of Bower's personal history. We know from his own statement that he was born in 1385; and in the British Museum MS. of the *Scotichronicon*—which MS. is known as *The Black Book of Paisley*—he is spoken of as 'the venerable father in Christ, Walter Bower, Abbot of the Monastery of St Columba.' This monastery was situated on the island of Inchcolm in the Firth of Forth. He died in 1449. Bower has been too much overlooked as one of the authors of the *Scotichronicon*, which is frequently quoted as if Fordun wrote the whole of it, whereas his share of the work, with the exception of certain further materials which he had collected, ends at the close of Book V. with the death of David I. (1153). Bower continued the history to the death of James I. (1437),

and as he was contemporary with the later events which he describes, he is for this period entitled to be regarded as an independent historian. Like Fordun, he wrote in Latin. The only edition of his history is that printed by Walter Goodall, Edinburgh, in 1759, and no complete translation of it has yet appeared.

Bowerbankia, a common genus in the class of Bryozoa or Polyzoa. These are colonies of minute but highly organised animals, which used to be included among the hydroids or zoophytes, but are now unanimously placed at a much higher level. *B. imbricata* is one of the commonest British coast forms. It grows on seaweeds, corallines, stones, &c., between high and low water mark, or in no great depth of water, and forms branching tufts sometimes $\frac{1}{2}$ inch in height. The branches are smooth and transparent, and bear numerous individual animals of microscopic size. The genus is named after James Scott Bowerbank (1797-1877), who wrote a famous monograph on the British Spongiadae (1864). See POLYZOA.

Bower-bird, a name given to certain Australian birds, probably in the great family of Timelineæ, or babbling thrushes, remarkable for their habit of making bower-like erections, called *runs* by the colonists of New South Wales, and for adorning them with gay feathers, rags, bones,

The Spotted Bower-bird (from Brehm).

shells, and such other white or brightly coloured objects as they can pick up. These bowers are not used as nests, but they appear to be places of much resort at the breeding-season in particular. Their structure has been carefully examined, and fine specimens of them, transported with no little difficulty, were deposited in the British Museum by Mr Gould, in whose magnificent work on the *Birds of Australia* (1848) a full account of them was first given to the world. The bowers of the Satin Bower-bird (*Ptilonorhynchus holosericeus*) are built among the low branches of some tree, and appear to be repaired and frequented from year to year. The base consists of an extensive and rather convex platform of sticks, firmly interwoven, on the centre of which the bower itself is built of more flexible twigs. It is chiefly at and near the entrance that the shells, feathers, &c. employed for decoration are placed. The bowers of the Spotted Bower-bird (*Chlamydochroa maculata*) are longer and more avenue-like than those of the satin bower-bird; they are placed upon the ground, are outwardly built of twigs, and beautifully lined with tall grasses so disposed that their heads nearly meet. The decorative propensity appears in the highest degree in this species. 'In some of the larger

bowers, which had evidently been resorted to for many years,' Mr Gould says, 'I have seen nearly half a bushel of bones, shells, &c. at each of the entrances.' These are arranged in much the same way at both entrances. Small pebbles are often transported by the birds from considerable distances.

The satin bower-bird is particularly abundant in the mountainous districts of the west of New South Wales, and is found in all the 'brushes' from the mountains to the coast. The adult male has the whole plumage of a deep, shining black. The colours of the female are grayish green and brown, curiously mingled.—The Spotted Bower-bird, which is rather smaller than the satin bower-bird, or about the size of a starling, has a general colour of rich brown, beautifully marked with black and buff; a band of elongated feathers of light rose-pink crosses the back of the neck, and forms a broad, fan-like, occipital crest. It is restricted exclusively to the interior of Australia.—The Regent-bird (*Sericulus melurus*) has also been shown to form bowers. Mr Coxen, an Australian ornithologist, to whom many interesting observations on bower-birds are due, has described the love-tent of the regent-bird. It is less dome-shaped and smaller than that of the satin bower-bird, and appears to be wholly adorned with snail-shells. The use of such elaborate contrivances in the process of courtship, and the possession of such obvious æsthetic tastes, are circumstances of great interest in estimating the height of development reached by birds.

Bowie-knife, an American hunting dagger, named after its inventor, Colonel Jim Bowie, who, born about 1790, fell at Fort Alamo in the Texan war (1836). In a great *mêlée* near Natchez (1827), in which six men were killed and fifteen wounded, the colonel despatched an opponent with a knife made out of a blacksmith's rasp or big file; and this knife he afterwards had fashioned at Philadelphia into the weapon with which his name is associated. Its curved, double-edged blade is 10 to 15 inches long, and above an inch wide.

Bowles, CAROLINE. See SOUTHEY.

Bowles, WILLIAM LISLE, D.D., poet, was born 24th September 1762, at King's Sutton, in Northamptonshire, where his father was vicar. Educated at Winchester School and at Trinity College, Oxford, in 1804 he became a prebendary of Salisbury Cathedral and rector of Breamhill, in Wiltshire. Here he spent in easy circumstances the rest of his long life, dying at Salisbury, 7th April 1850. His earliest publication, *Fourteen Sonnets, written chiefly on Picturesque Spots during a Journey* (1789), was received with extraordinary favour: the contents of the little volume were fresh and natural, all the more charming because of the contrast they offered to the style of poetry which had long been in vogue. Coleridge, Wordsworth, and Southey were among their enthusiastic admirers; and through his influence over them, Bowles may be looked on as the founder of a school of English poetry in which his own name was soon eclipsed by theirs. Of his subsequent poetical works (14 vols. 1789-1837) the longest is *The Spirit of Discovery*, and the best, perhaps, *The Missionary*. As a poet Bowles shows a fine appreciation of the beauties of nature, and pleases by the expression of pure and generous sentiment, as well as by the playfulness of fancy and perfect scholarly correctness; but he is deficient in vigour and depth. In 1807 he published an edition of Pope, and an opinion which he expressed on Pope's poetical merits led to a rather memorable controversy (1809-25) in which Campbell and Byron were his antagonists, and which turned chiefly upon the comparative

value in poetry of images derived from nature and those derived from art. Of his prose writings may be mentioned a rather dry *Life of Bishop Ken* (2 vols. 1830). See the Memoir by Gilliland prefixed to his collected poems (Edin. 1855).

Bowling, a Dumbartonshire village, on the Clyde, 3½ miles ESE. of Dumbarton. Pop. 803.

Bowling Green, a town of Kentucky, capital of Warren county, on the Barren River, 114 miles S. by W. of Louisville by rail. It has a woollen factory and several mills, and some river traffic. Pop. 7803.

Bowls, or BOWLING, is an English pastime of undoubted antiquity. Strutt in his *Sports and Pastimes* reproduces a picture of two men playing a game with bowls from a MS. of the 13th century (Royal Library), and another from a MS. of the 14th century, representing three men bowling at a 'jack,' very much as the game is now practised, except that the players have only one bowl apiece.

It seems to be a doubtful point whether the ancient game was played in the open air or in closed alleys, or both; or whether, perhaps, there may not have always been two varieties of the game, one the outdoor game as we now know it, and an undercover game of bowling at pins. There is no doubt that, in the 15th and 16th centuries, *bowling-alleys* were not only very numerous, especially in the city and suburbs of London, but also became public nuisances on account of the gambling and dissipation carried on in connection with them. In the reign of Edward IV. a stringent act was passed forbidding any one to play at, among other games, *half-bowl*, either in 'house, tenement, garden, or other place,' on account of players being induced to play 'till they be utterly undone and impoverished of their goods.' This game of half-bowl is described by Strutt as still being played in Hertfordshire in his day (1801); fifteen small pins were bowled at with half of a sphere of wood, hence the name.

The name *bowls* first occurs in several acts passed by Henry VIII., who prohibited any person or persons, 'for his or their gain, lucre, or living, to keep, have, hold, occupy, exercise, or maintain any common house, alley, or place of bowling.' In spite of these acts, however, the game continued to exist, as it was not till the reign of George II. that the gambling *alley* game, against which the denunciations of the law seem to have been directed, became, more or less, actually suppressed. From about the same time, however, the outdoor game spread with such rapidity, that before the close of the century it was almost universal all over England and Scotland.

Bowling as now played is a delightful summer-evening game, and affords pleasant recreation to thousands who are past the age at which the more violent exertions of cricket or football have charms. Every village has its club and 'green,' and larger towns have them in every district. Its great drawback as a popular game is the expense of preparing the necessary smooth, fine turf-green, this being, according to circumstances, from £100 to £300, or even more. So much, however, is it acknowledged to be a healthful and innocent recreation, that the civic authorities of many towns have prepared public greens, where, for a small charge, players may enjoy the game who are not able to indulge in the luxury of private ground.

The game itself is a very simple one. The requirements are a piece of fine *level* turf 40 to 60 yards square, surrounded by a shallow ditch, a pair of bowls for each player, and a small white ball or 'jack.' The green is usually sunk below the level of the surrounding ground. The bowls are

made of lignum-vitæ, 6 to 7 inches in diameter, turned more or less oval, with one side a little rounder than the other. This gives a *bias* to the bowl, which rolls in a curved direction instead of straight.

The players are usually arranged into opposing sides of four each, although any number can play. The jack having been thrown by one of the players to a distance of not less than 20 yards from one end of the green, the object of the combatants is to roll their bowls so as to lie as near the jack as possible. The bias gives scope for considerable skill in playing the bowl, as it may be made to curve in, either from the right or from the left, as may seem best in order to dodge round other bowls which may be in the way. When all the sixteen bowls have been played, a point is counted for every bowl belonging to one side which is nearer the jack than the nearest bowl of the other side. The jack is then thrown by the winning side to the other end of the green, another 'end' played as before, and so on till one side or the other becomes game; which may be any number mutually agreed on—usually 21 or 31. The game may also consist of so many ends to be played, the side counting most at the conclusion to be the winner. Each side appoints one of their number 'skip,' who has full authority to direct the play of the others of his side. The game is identical in principle with 'Curling' (q.v.), with the difference, that the distance is always fixed in the latter, while in bowling it is uncertain. There are regularly appointed rules for playing the game, providing for such points as the jack being moved by a bowl, or being thrown into the ditch, and many other details which are beyond our province.

Bowling is also the name applied to a game of ten pins introduced from the United States. It is evidently either an improved variety of the English Skittles (q.v.), or a revival of a game called *long-bowling* or Dutch rubbers, which was played in England about the middle of the 18th century, and was exactly like the American game, except that nine pins were used. This game of long-bowls again was obviously either a development of the ancient half-bowl or similar game of bowls and pins, or a bodily introduction of the Dutch game of ninepins as played by 'Rip Van Winkle.' The game is becoming common in this country, where, in the suburbs of almost every large town, the 'American Bowling Alley' is a popular resort of the youth of the district. It is played in a covered alley on a prepared board 60 feet long by 4 feet wide. In America the board is slightly convex in the centre, and bevelled to the sides. The ten pins, usually of ash, and about 1 foot high,

are arranged as in the figure. Each player in turn rolls three bowls from the other end of the board, trying to knock over as many pins as possible. If he knocks all the ten down before he exhausts his three throws, he is entitled to get them set up again to complete his turn. He may even knock all the pins down with each of his three bowls, in which case he scores the maximum for his turn, 30, being one for each pin down. The other players then have their turn. A game consists of three or more such turns of three bowls for each player; he who knocks over most pins being the winner. The bowls are usually made of lignum-vitæ, are round, and of unlimited size, generally varying from $\frac{1}{2}$ a lb. to 5 or 6 lb. in weight. Such is the principle of the game, but in practice a complicated method of scoring exists. When a player knocks all the pins down with one or two bowls, he has what

is called a 'spare' or a 'double spare'—i.e. he has one shot or two shots, as the case may be, to spare. To save time he does not get the pins put up again immediately, but waits for his next turn, when, in the case of a 'spare,' his first shot, and of a 'double,' his first two shots are counted double—viz. once for the spares of the turn before, and once for the current turn. He may even have another double or single spare, when the scoring is carried over into the third turn, and so on. In the last turn of the game, however, the spares must be played off at once. This game is undoubtedly good exercise, but it has the drawback of not being played in the open air, and it is also too often associated with the public-house to be an altogether desirable game for young men. For bowling in cricket, see CRICKET.

Bowman, SIR WILLIAM, oculist, was born in Nantwich, 20th July 1816, studied chiefly in London, where he commenced practice as a surgeon, and became curator of the Anatomical Museum. In conjunction with Todd he published the *Anatomy and Physiology of Man* (5 vols. 1845-56), and gained reputation as an oculist by his *Lectures on Operations on the Eye* (1849). He was professor of Physiology at King's College, London (1845-55), F.R.S., LL.D., and a baronet (1884). He died 29th March 1892, and his *Collected Papers* (2 vols.) were published the same year.

Bowness, a town of Westmorland, on the east side of Windermere, 8 miles NW. of Kendal. Pop. 2062.

Bowring, SIR JOHN, born in Exeter in 1792, on leaving school entered a merchant's office, and there pursued that course of polyglot study whereby, as he afterwards boasted, he knew two hundred, and could speak a hundred, languages. The national poetry of different peoples had special attractions for him, and he rendered great service to literature by translating both the more ancient and the more modern popular poems of almost all the countries of Europe. In 1821 he formed a close friendship with Jeremy Bentham, and in 1824 became the first editor of his radical *Westminster Review*, to which, as becomed the descendant of an old Puritan stock, he contributed many articles on freedom in religion and politics, as well as on literary subjects. In 1828 he visited Holland; and his *Sketch of the Language and Literature of Holland* (1829) procured for him the degree of Doctor of Laws from the university of Groningen. Subsequent travels were undertaken by him, on a commission from the British government, to inquire into the commercial relations of certain states. He visited Switzerland, Italy, Egypt, Syria, and finally the countries of the German Zollverein, and everywhere found materials for valuable reports. He sat in parliament for Kilmarnock from 1835 to 1837, for Bolton from 1841 to 1849, and actively promoted the adoption of free trade. In 1849 he was appointed British consul at Hong-Kong, and superintendent of trade in China. He returned in 1853, and in the following year was knighted and made governor of Hong-Kong. In 1856, an insult having been offered to a Chinese pirate bearing the British flag (the 'affair of the *lorcha Arrow*'), Bowring, without consulting the home government, ordered the bombardment of Canton, a proceeding which excited grave dissatisfaction at home, and nearly upset the Palmerston ministry. In 1855 he concluded a commercial treaty with Siam, in 1858 made a tour through the Philippine Islands; and his accounts of those two visits are about the most readable of his thirty-six works. He retired with a pension in 1859, and died at Claremont, Exeter, 23d November 1872. See his *Autobiographical Reminiscences* (1877).

Bowsprit is a strong boom or spar projecting over the stemhead or bows of a sailing-ship, and also of a steamship when the stem of the latter is of the curved or cut-water description. Its use is to support the jib-boom, a longer and lighter spar, forming a continuation of the bowsprit, which receives the lower ends of the foremast stay-ropes, on which sails are carried.

Bowstring, the string of a bow, is a name specifically used for an old Turkish mode of execution, the offender being strangled by means of a bowstring.

Bowstring Hemp, or *MOORVA*, is the fibre of a species of *Sansevieria* (especially *S. Zeylanica*), a plant of the natural order Liliaceæ (q.v.), tribe Hemerocallææ, used for making bowstrings in the East Indies. The fibre is hair-like and silky, elastic, and in strength apparently about equal to hemp. It does not rot in water so soon as hemp.—A very similar species (*S. guineensis*) is found in abundance on the west coast of Africa, and its fibre has been imported as African Bowstring Hemp.

Bow-window. See BAY-WINDOW.

Bowyer. SIR GEORGE, born in 1811 at Radley, near Oxford, in 1839 was called to the bar. Converted to Catholicism in 1850, he represented Dundalk 1852-68, and the county of Wexford 1874-80, when his Home Rule principles estranged him from the Liberal party, and in 1876 led to his expulsion from the Reform Club. He succeeded his father as seventh baronet in 1860, and died suddenly in London, 7th June 1883. He was author of several able works on constitutional law and Catholic subjects.

Bowyer. WILLIAM, an eminent English printer and classical scholar, born in London, 19th December 1699, was educated at Cambridge, and in 1722 joined his father, William Bowyer (1663-1737), in trade. Appointed in 1729 printer of the votes of the House of Commons, he subsequently became printer to the Society of Antiquaries and to the Royal Society. In 1767 he was nominated printer of the Rolls of the House of Lords and the Journals of the House of Commons. He died 18th November 1777. Bowyer published several philological tracts, edited several volumes of Swift's works, translated Rousseau's famous but paradoxical *Discourse* (1751), and wrote two essays on the *Origin of Printing* (1774); but his chief production was an edition of the New Testament in Greek with critical and emendatory notes.

Box (*Buxus*), a genus usually reckoned to belong to the Euphorbiaceæ; evergreen shrubs or small trees, with greenish inconspicuous monocious flowers in little axillary spikes or fascicles. The Common Box (*B. sempervirens*) grows wild through South Europe, North Africa, North Asia to Japan, West Asia to West Himalaya. It is generally regarded as a true native of Surrey and the south of England, where it grows on dry chalky hills. In Britain, it seldom attains a height of more than 12 or 14 feet, though in warmer countries it is often twice that height, and though the three classic box-trees in Queen Mary's 'child-garden' at Inchmahome, in the Lake of Menteith, are 20½ feet high. The box is remarkable for its compact habit of growth and densely crowded branches and leaves, presenting a very solid mass of foliage, hence it bears clipping remarkably well; and in the old 'topiary' style of ornamental gardening it occupied an important place, being cut into architectural and fantastic figures. A dwarf variety is used for edging garden-plots, and different kinds are grown in our shrubberies. The bitter and purgative leaves are no longer officinal. The wood of the box is heavier than that of any other European

tree, and is the only European wood that sinks in water. It is of a beautiful pale-yellow colour, remarkably hard and strong, of a fine regular and compact texture, capable of a beautiful polish,

Branch of the Common Box (*Buxus sempervirens*).

and not liable to be worm-eaten. It is much valued for the purposes of the turner and the wood-carver; is preferred to every other kind of wood for the manufacture of flutes, flageolets, and other wind-instruments, as well as of mathematical instruments; and is unrivalled for wood-engraving, admitting of a finish as sharp and fine as metal, whilst it takes the ink much better (see ENGRAVING). The box of commerce comes mainly from Caucasia, parts of Turkey in Asia, and Persia; but the reckless destruction of the box-trees has rendered the supplies scarce and dear. In 1815 as many box-trees were cut down at Box Hill, in Surrey, as brought upwards of £10,000; but the tree is of so very slow growth that it is seldom planted in Britain except for ornament.—The Minorea Box, or Balearic Box (*B. balearica*), a native of the Mediterranean countries, &c., is a larger tree than the common box. The wood is of a bright yellow, and inferior to the true box-wood, but is brought in large quantities from Constantinople under that name.

Box-days. These are days appointed by the Court of Session in Scotland, in the vacations and Christmas recess, on which pleadings or other law-papers may be lodged or filed, the object being to expedite the procedure, notwithstanding the vacation or recess. The name is derived from the fact that all printed papers in the Court of Session must be placed in boxes, one for each judge, for each legal society, and for the reporters. These boxes were introduced in 1690 to avoid the evil of private solicitation of judges.

Box-hauling is a mode of turning a ship, when the swell of the sea renders tacking impossible, or when the ship is too near the shore to allow room for veering. The operation is effected by hauling the head-sheets to windward, bracing the head-yards aback, and squaring the after-yards, the helm at the same time being put alee. *Boxing-off* is a very similar operation.

Boxing. See PUGILISM.

Boxing-day, the day after Christmas, and so called in England from being the day on which *Christmas-boxes*, or presents, are given to servants and others. See CHRISTMAS.

Boxtel, a town in the Dutch province of North Brabant, 38 miles S. by E. of Utrecht. An Anglo-Dutch army, under the Duke of York, was here defeated with great loss by the French in 1794. Pop. 6082.

Box-thorn (*Lycium*), a genus of Solanaceæ, having funnel-shaped or tubular flowers, and

2-celled berries. Several species are natives of the south of Europe, thorny shrubs, with long slender shoots and simple lanceolate leaves. *L. europæum* may be trained to a height of 30 or 40 feet, and is often planted—as are also other species—to cover walls, &c. *L. vulgare* has been sparingly naturalised in the United States. *L. fuchsoides*, although destitute of spines, is used as a hedge-plant in the Andes of Quito.

Boyacá, a department of Colombia, touching Venezuela. In the west it is mountainous; in the east it has vast prairies, and is watered by the Meta and its tributaries. The Muzo emerald mine is the richest in the world, and the department is rich in salt springs, coal, iron, plumbago, and copper ore. Area, 33,351 square miles; pop. 483,874. Capital, Tunja, with 6000 inhabitants.

Boyar, an order in old Russia, next to the knjazes or knjeses (ruling princes). They had their own partisans, and gave their services to a prince of their own choice, whom they left again at their pleasure. They held the highest military and civil offices, and were so universally looked up to by the mass of the people, that the most powerful rulers considered it prudent to use this form in their ukases: 'The emperor has ordered it; the Boyars have approved it.' Their rank was always proportioned to length of state-service. In their housekeeping the Boyars were excessively fond of splendour, and their contempt for the serfs or 'lower orders' was immeasurable. Their power acted as a wholesome check upon the authority of the princes, in consequence of which the latter became their bitter enemies. Peter the Great finally abolished the order by giving them a place among the Russian nobility, but at the same time stripping them of their peculiar privileges.—The higher nobility of Roumania are also called Boyars.

Boyaux (Fr., 'bowels') are the zigzag approaches used in siege operations to connect the parallels. See SIEGE.

Boy-bishop. The custom of electing a boy-bishop on St Nicholas's Day dates from a very early period. It spread over most Catholic countries, and in England seems to have prevailed in almost every parish. Although the election took place on St Nicholas's Day (6th December), the authority lasted to Holy Innocents' Day (28th December). The boy-bishop was chosen from the children of the church or cathedral choir, or from the pupils at the grammar-school. He was arrayed in episcopal vestments, and, attended by a crowd of subordinates in priestly dress, went about with songs and dances from house to house, blessing the people, who, as Bishop Hall says, 'stood grinning in the way to expect that ridiculous benediction.' The mock prelate exacted implicit obedience from his fellows, who, along with their superior, took possession of the church, and performed all the ceremonies and offices except mass. The custom found countenance not among the populace only. In 1299 Edward I., on his way to Scotland, permitted a boy-bishop to say vespers before him at Heaton, near Newcastle-on-Tyne. At Salisbury the boy-bishop, it is said, had the power of disposing of such prebends as happened to fall vacant during the days of his episcopacy; and if he died during his office, the funeral honours of a bishop, with a monument, were granted him. The genuineness of the effigy in Salisbury Cathedral known as 'the boy-bishop's monument' has, however, been seriously questioned. In England, the custom was abolished by a proclamation of Henry VIII., dated July 22, 1542; restored by Queen Mary in 1554; and again abolished during the reign of Elizabeth, though it seems to have lingered

here and there in villages till about the close of her reign. On the Continent it was the subject of a formal interdict at the Council of Basel (1431); and at Zug, in Switzerland, a similar usage was suppressed so recently as 1797.

Boyce, WILLIAM, composer, born in London, 1710, was a chorister at St Paul's, and was appointed composer to the Chapel-royal in 1736, and organist in 1758. He received the degree of Doctor of Music from Cambridge in 1749, and was master of the king's band from 1755. He died at Kensington, 7th February 1779. Boyce holds a high rank as a composer of church music, his two services and several of his anthems being still frequently performed. His songs include 'Hearts of Oak,' written for one of Garrick's pantomimes; and a miscellaneous collection of his songs and cantatas extended to 6 volumes. His best work is the serenata of *Solomon* (1743); his most valuable publication is a collection of the *Cathedral Music* of the two preceding centuries (3 vols. 1760).

Boycotting, the system of combining to hold no relations, social or commercial, with a neighbour, in order to punish him for differences in political opinion—a kind of social excommunication. It was first formulated by Mr Parnell, the Irish leader, at Ennis on 19th September 1880, and derived its name from one of the first victims, Captain Boycott, a Mayo factor and farmer, who has had for his sufferings the consolation of giving a new word to most European languages. The term 'exclusive dealing' has been applied by its apologists to boycotting, which was brought within the law by the Crimes Act of 1887.

Boyd, REV. ANDREW KENNEDY HUTCHISON, D.D., son of the parish minister of Auchinleck, Ayrshire, where he was born November 1825, was educated at King's College, London, and Glasgow University, where he took the highest honours in philosophy and theology. He was in succession minister in three Scottish parishes before his settlement at St Andrews. He first became known in literature by his familiar essays contributed to *Fraser's Magazine* under the now well-known initials A. K. H. B., most of which have been reprinted—some of these, in three series of them as *The Recreations of a Country Parson* (1859-61). Three volumes of reminiscences—*Twenty-five Years of St Andrews* (2 vols. 1892) and *St Andrews and Elsewhere* (1895)—were his last considerable work. He died 1st March 1899.

Boyd, ZACHARY, born in Ayrshire about 1585, and educated at Glasgow and St Andrews, became a professor in the college of Saumur (q.v.). The persecution of the Huguenots having caused him to return to Scotland in 1621, he was two years later appointed minister of the Barony parish, Glasgow, and was thrice elected rector of the university. His principal prose work, *The Last Battell of the Soule in Death* (1629), was reprinted, with a life of the author, by Gabriel Neil, in 1831; of the quaint *Zion's Flowers* (1644)—mostly metrical versions of Scripture history, and commonly called 'Boyd's Bible'—a selection was reprinted in 1855; and the *Four Letters of Comfort* (1640) were reprinted in 1878. He died in 1653 or 1654, leaving numerous MSS. and his library, with a considerable legacy, to Glasgow University.

Boydell, JOHN, engraver and publisher of prints, was born at Dorrington, Shropshire, in 1719, and in 1741 trudged up to London, where he learned engraving, and presently started a print-shop. English engraving was then at a low ebb, but under Boydell's liberal patronage of native artists, the importation of foreign prints not only almost ceased, but English prints were exported to the Continent. Boydell now determined to do for

English painting what he had done for engraving. He accordingly selected Shakespeare's works for illustration, and secured the most eminent painters in the kingdom, including Opie, Reynolds, Northcote, and West. The result was the 'Shakespeare Gallery,' from which was engraved a superb volume of plates (1803) to accompany a splendid edition of Shakespeare's works in 9 vols. fol. (1792-1801). The immense sums of money he spent on these illustrations, and the commercial depression consequent on the French Revolution, brought him into difficulties, from which he was not wholly extricated at his death, 12th December 1804. In 1790 he had been Lord Mayor.

Boyer. ALEXIS, BARON DE, a great French surgeon, was born in 1757 at Uzereches in Limousin. A tailor's son, he in 1805 was appointed first surgeon to the Emperor Napoleon, who raised him to the rank of baron, and whom he accompanied on his campaigns and journeys. After the Restoration he became professor of Practical Surgery in the university of Paris, and first surgeon at the Hôpital de la Charité. In 1825 he was admitted a member of the Institute. He died 25th November 1833. His greatest works are his *Traité Complet d'Anatomie* (4 vols. 1797-99), and *Traité des Maladies Chirurgicales* (11 vols. 1814-26; 5th ed. 1853).

Boyer. JEAN PIERRE, president of the republic of Hayti, was born of a mulatto family, 28th February 1776, at Port-au-Prince. Sent to France at a very early age, he received a European education, and in 1792 entered the military service. He soon distinguished himself by his conduct against the British on their invasion of his native isle, and afterwards joined the party which aimed at the complete emancipation of the colony. He aided Pétion in overthrowing the bloody tyrant Dessalines in 1806, and establishing an independent republic in the western part of the island. His wisdom and courage saved the struggling state, and his loyal support of Pétion caused the latter on his deathbed to recommend him to the people as his successor in the president's chair. After the death of Christophe, he united the negro district with the mulatto in 1820, next year added also the eastern district, hitherto Spanish, and in 1825, upon payment of 150 millions of francs, obtained recognition of independence from France. He governed the republic of Hayti well for fifteen years, but at length his partiality to the mulattoes made him so unpopular with the pure negroes that they rose in insurrection in 1843. Boyer fled to Jamaica, and subsequently went to Paris, where he died 9th July 1850.

Boyle, a town in County Roscommon, Ireland, on the river Boyle, above its expansion into Lough Key, 108 miles NW. of Dublin by rail. It has a thriving trade in corn, flax, butter, and provisions. An abbey, built here in the 12th century, was reduced to its present ruined state in 1595 by the Earl of Tyrone. Pop. 2464.

Boyle. CHARLES, fourth Earl of Orrery, was born in 1676, succeeded to the title in 1703, in 1721 was imprisoned in the Tower as a Jacobite, and died in 1731. In the *Battle of the Books* (1695-98), the great controversy on the *Letters of Phalaris*, he was Atterbury's stalking-horse against Bentley (q.v.); and in his honour the name 'Orrery' was given to the scientific apparatus of that name by its inventor, Graham, to whom he had been kind. Of his poems, even Sir Richard Blackmore said:

After his foolish rhymes, both friends and foes
Conclude they know who did not write his prose.

Boyle. JOHN, born in 1707, succeeded as fifth Earl of Orrery in 1731, and of Cork in 1753. In spite of his father's statement in his will that his

son had no taste for letters as a reason for bequeathing his library to Christ-Church, he made for himself a place in literature by *Remarks on Swift* (1751), a book marred by grudging praise and manifest malice, as well as an incapacity to comprehend the genius of his subject; as also by a translation of the *Letters of Pliny* (1751), which is still considered excellent. He died in 1762. He was long the intimate friend of Pope and Swift; the latter, indeed, writes to Pope that next himself he loves 'no man so well.' It is now impossible to determine why this much-loved friend tried to stab Swift when laid in the quiet safety of the grave. Berkeley said of Boyle that he 'would have been a man of genius had he known how to set about it,' and Johnson says he 'would have been a liberal patron if he had been rich.'

Boyle. RICHARD, the founder of the house of Cork and Orrery, and fitly styled the Great Earl of Cork, was born 13th October 1566, at Canterbury, of a good but not wealthy family, originally from Herefordshire. After having studied at Cambridge and the Middle Temple, he went over to Ireland with a few pounds in his pocket to hew his way to fortune. His energy, prudence, and signal capacity for government received their reward. He married at Limerick, Joan, daughter and co-heiress of William Ansley, at whose premature death he became possessed of £500 a year in lands. He purchased estates and improved them, for £1000 buying 12,000 acres of fertile land in Cork, Waterford, and Tipperary; he promoted the immigration of English Protestants, and triumphed over the envy of his enemies, making good his cause with Queen Elizabeth, and winning her favour. Cromwell is said to have remarked regarding his improved estates, that had there been one like him in every province rebellion would have been impossible. He profited by the introduction of manufactures and mechanical arts, reaping, it is said, from his ironworks £100,000. He built bridges, founded harbours and towns, and thirteen strong castles for their defence. About 4000 persons found employment on his vast plantations. For his services in connection with English rule in the south of Ireland honours flowed in upon him; he was knighted in 1603; and in 1620 he became Viscount Dungarvan and Earl of Cork. In 1631 he was made lord high-treasurer, an office which remained hereditary in his family. On the appointment of Wentworth, afterwards Earl of Strafford, as lord-deputy, he suffered to the extent of £40,000 by charges preferred against him by the latter. In his old age the Munster rebels compelled him to gird on armour, and turn his castle into a fortress. He soon raised a little army of his servants and tenants, and with an auxiliary force commanded by his four sons (and paid, when his money was spent, out of his plate-chest), the noble old earl took castles, smote the rebels, and quenched rebellion in his borders. He died 15th September 1643, and was buried at Youghal.

Boyle. THE HON. ROBERT, the most celebrated natural philosopher of his time, seventh son and fourteenth child of Richard Boyle, first Earl of Cork, was born at Lismore Castle, province of Munster, Ireland, January 25, 1627. As a child, he was distinguished by precocity of intellect, a rare love of truth, and a serious disposition. After studying at Eton, and under the rector of Stalbridge, Dorset, he went to the Continent, where he stayed for six years. On his return in 1644, he found himself in possession, by his father's death, of the manor of Stalbridge, where he took up his abode, and resided till 1650. He took no part in political strife, but devoted himself to the cultivation of science, and particularly of chemistry

and natural philosophy. He was one of the first members of that association of scientific men which about that time (1645) held private meetings at Oxford and London, and some years after became better known as the Royal Society. After several visits to his Irish estates, in 1654 he settled at Oxford. Here he experimented extensively in pneumatics, and improved the air-pump. At the same time, he devoted earnest attention to the study of theology. After the Restoration, he was urgently advised by Lord Clarendon to enter the church, but he thought that he could do better service to religion as a layman. Among the proofs which he gave of this, besides his own theological writings and eminent example, were his exertions as a director of the East India Company (for which he had procured the Charter) for the propagation of Christianity in the East, as well as procuring and circulating at his own expense translations of the Scriptures, and his bequest for the foundation of the 'Boyle Lectures' (q.v.) in defence of Christianity. In 1668 he took up his residence permanently in London with his sister, Lady Ranelagh, in Pall Mall, and was thenceforth able to devote much of his time to the business of the Royal Society. In 1680 he was chosen president, but declined the honour. A peerage had repeatedly been offered to him, and declined. In 1688, finding his health decline, he shut himself up against all interruption, in order to husband his remaining time for the labour of repairing the loss caused by the accidental destruction of his MSS. In 1691 his health finally gave way, and on the 30th of December 1691 he died, seven days after his beloved sister, Lady Ranelagh. Boyle, who was never married, was tall and emaciated in person, and extremely temperate in his habits, often subject to low spirits, but naturally lively and of rare conversational powers. He was on terms of intercourse with royalty. He believed in the possibility of some of the alchemistic transmutations; but by the number of facts and observations which he patiently collected, and erroneous notions which he cleared away, he has been termed the true precursor of the modern chemist. He invented a compressed-air pump, and the first English hermetically sealed thermometer was made under his directions. He is known to have discovered the law commonly called 'Mariotte's law' seven years before Mariotte (q.v.), and to have established it independently. His piety, benevolence, and charity would have made him remarkable, apart from his scientific attainments and reputation. His complete works (including his very interesting correspondence), with a Life by Dr Birch, and an index, were published in 5 vols. fol. (Lond. 1744).

Boyle, ROGER, soldier and statesman, was born in 1621. The third son of the Earl of Cork, he was made for his father's services Baron Broghill in 1627. He was educated at Trinity College, Dublin, and on the outbreak of the Civil War naturally took the royalist side; but after the death of the king, came under the personal influence of Cromwell, and distinguished himself by his conduct in the Irish campaign, especially under the eye of his chief in the desperate struggle at Clonmel. In Cromwell's (1654) parliament he sat for Cork, and in 1656 was named for both that city and Edinburgh, where he had been lord president of the council for a year, and 'gained more,' says Robert Baillie, 'on the affections of the people than all the English that ever were among us.' He became one of Cromwell's special council, and a member of his House of Lords. It was chiefly at his instance that the parliament urged the Protector to assume the title of king, and it was he who proposed a marriage between Cromwell's daughter Frances and Charles II. After Cromwell's death, he tried to support

Richard, but foreseeing that his cause was hopeless, crossed to Ireland, and secured it for the king. Indeed, his letter inviting Charles to land at Cork actually reached the prince before the first message from Monk. Four months after the Restoration, Broghill was made Earl of Orrery. He continued to enjoy the favour of the king, who put a stop to an attempt at his impeachment by the House of Commons in 1668. He died in 1679. He wrote poems, six tragedies, two comedies, a romance entitled *Parthenissa* (1654), and a *Treatise of the Art of War* (1677); and enjoyed the friendship of Davenant, Dryden, and Cowley.

Boyle Lectures, so called from the founder, the Hon. Robert Boyle (q.v.), who, by his will dated July 28, 1691, settled £50 a year for 'some preaching minister,' who shall preach eight sermons in the year for proving the Christian religion against Atheists, Theists (i.e. Deists), Pagans, Jews, and Mohammedans, not descending to any controversies among Christians themselves. The office is tenable for three years. They are now preached in the Chapel-royal, Whitehall, in the afternoon of some of the Sundays following Easter-day. The first series of eight lectures, *A Confutation of Atheism*, was preached in 1692 by Richard Bentley. In 1704 Dr Samuel Clarke preached on the *Being and Attributes of God*, in answer to the arguments of Hobbes, Spinoza, and their followers. All the lectures preached up to 1732 were collected into a fine folio edition, in 3 vols. (1739); from that period down to 1802 few of the lectures were published. In 1846 the course by the Rev. F. D. Maurice was published under the title, *The Religions of the World*. The most eminent lecturers of recent years whose courses have been published are Merivale, the historian (1864-65), on *The Conversion of the Roman Empire and Northern Nations*; Professor Plumptre (1866); Professor Stanley Leathes (1868-70); Dr Hessey (1871-73); Henry Wace (1874-75); Alfred Barry (1876-78); Dr Maclear (1879-80); and G. H. Curteis (1884).

Boyle's Fuming Liquor is the term applied to a solution of sulphide of ammonium obtained by distilling a mixture of slaked lime, sal-ammoniac, and sulphur. The same substance is produced by passing sulphuretted hydrogen into a solution of ammonia. It is a straw-coloured liquid, possessing the odour of rotten eggs, and liberating sulphuretted hydrogen on addition of an acid or exposure to the air.

Boyne, a river in the east of Ireland, rises in the Bog of Allen, and flows through Kildare, King's county, Meath, and Louth. It passes Trim, Navan, and Slane, and enters the Irish Sea 4 miles below Drogheda, after a course of about 80 miles in a carboniferous limestone basin, its total descent being 336 feet. On its estuary near Drogheda there is a lighthouse with fixed light, there are three at the entrance to the harbour, and a viaduct 95 feet in height conducts the Great Northern Railway across the river. Its chief tributaries are the Mattock and Blackwater. It is navigable for vessels of 250 tons to Drogheda, and for barges of 70 tons to Navan, 19 miles up. Its banks are studded with many ruins of monasteries and castles. In 838 Turgesins the Dane sailed up the Boyne and plundered Meath. But this river is chiefly famous for the battle of the Boyne, which was fought on its banks, 3 miles W. of Drogheda, on 12th July 1690, and in which William III. defeated James II. William's loss was 500, James's three times that number. An obelisk, 150 feet high, marks the scene of the battle.

Bozen. See BOTZEN.

Bozrah (modern *cl-Busairah*), a strong town of Edom, in the mountain district to the south-east

of the Dead Sea, about 300 B.C. capital of the Nabateans, but now an unimportant village.

Bozzaris, MARCOS, Greek patriot, was born about 1788 at Suli, in the mountains of Epirus. His youth was spent amid the din of arms. In 1803 he was forced to retreat to the Ionian Isles by Ali Pasha (q.v.), who had nearly exterminated the Suliotes. In 1820 Ypsilanti summoned the Greeks to insurrection, and war broke out between Ali Pasha and the sultan. On learning the news, Bozzaris put himself at the head of some 800 expatriated Suliotes, and passed over into Epirus. Ali found means to secure their services against the common enemy, and Bozzaris gained several victories, and on Ali's death continued the war successfully. Shortly after, Prince Mavrocordato landed at Missolonghi with a body of disciplined troops, and being joined by Bozzaris, he engaged the Turks at Petta, 16th July 1822, but was compelled to retire to Missolonghi, which place Bozzaris skilfully defended. In 1823 a Tureo-Albanian army of 13,000 men descended from the north of Epirus. Bozzaris advanced swiftly at the head of 1200 men, and on 20th August reached Karpenisi, where the van of the Turkish army, 4000 strong, was encamped. At night, 350 Suliotes burst in upon their startled foes, who were routed with great slaughter; but Bozzaris fell while leading on his men to the final attack.

Bozzolo, a town of North Italy, 14 miles WSW. of Mantua. Pop. 4154.

Bra, a town of North Italy, 31 miles SSE. of Turin by rail. Pop. 9856.

Brabançonne, the patriotic song of the Belgians, originally sung by the insurgents during the revolution of September 1830. The words were written by Jenneval, a young French actor, then at Brussels, the music by Campenhout.

Brabant was the name formerly given to an important province of the Low Countries, extending from the left bank of the Waul to the sources of the Dyle, and from the Maas and the plain of Limburg to the Lower Scheldt. In the time of Cesar, Brabant was inhabited by a mixed race of Germans and Celts; it afterwards came into possession of the Franks; and in the middle ages it formed a duchy by itself, dependent upon Lower Lorraine, with which in 1107 the county of Antwerp was incorporated, and in 1347, for a time, the lordship of Mechlin or Malines, formerly connected with Liège. After many changes, Brabant was made a part of the kingdom of Holland, at the Congress of Vienna; but since the revolution of 1830, the three provinces of Brabant have been divided as follows: (1) North or Dutch Brabant, containing 1980 sq. m. and (1892) 519,022 inhabitants; (2) the Belgian province of Antwerp, which contains 1094 sq. m. and (1892) 726,233 inhabitants; and (3) South Brabant, also Belgian, containing 1268 sq. m. and an extremely dense population of (1892) 1,136,827. The country consists of a plain gently sloping to the north-west, and rising in the south into low hills, which are offsets of those of the Ardennes. In the level northern part are many heathy and fenny tracts; one of them, a morass called the Peel, is over 20 miles in length, and from 2 to 6 broad. In the hilly district of the south is the Forest of Soignies. The Maas and the Scheldt are the principal rivers; but some of their tributaries are also very useful for internal commerce, which is further promoted by canals and railways. The soil is fertile, and grain, vegetables, and hay are extensively grown; also hops, tobacco, and chicory. Farm stock is large. The making of salt, beet-sugar, cigars, thread, woollen cloths, leather, earthenware, and soap, with printing, distilling, and turkey-red dyeing, are the chief industries.

Brabant lace has a certain celebrity. The principal towns are Brussels, the former capital of Brabant, Bois-le-Duc (Hertogenbosch), Tilburg, Breda, and Bergen-op-Zoom. Most of the inhabitants are Catholics; those in the north are Dutch; in the middle district, Flemish; and in the south, of Walloon race. The main boundary between the languages is a few leagues to the south of Brussels, the Walloon French being spoken to the south, and Flemish and Dutch to the north of this line.

Braccio, FORTEBRACCI, COUNT OF MONTONE, a celebrated Italian free-lance, born at Perugia, of an old patrician family, in 1368. From his early youth he was engaged in warfare, and had already given his sword to very various causes, when in 1416 he obtained the sovereignty of his native city. The year after he held Rome for a time. Next he accepted from Queen Joanna of Naples the command of her land-forces, and soon for his services was created Count of Foggia and Prince of Capua. In 1423, by the queen's command, he was crowned at Perugia, as Prince of Aquila and Capua. His ambition now soared to the throne of Naples itself. He overran Campania and Apulia, and advanced into Calabria, but in a battle before Aquila, was wounded and taken prisoner. Three days later he died, June 5, 1424.

Brace, in Carpentry, an oblique piece of wood used to bind together the principal timbers of a roof or other wooden structure. The name is also used of the curved iron tool (holding a *bit*) used by carpenters for boring. See ROOF, BORING.

Brace, CHARLES LORING, an American author and philanthropist, born at Litchfield, Connecticut, 19th June 1826, studied theology in New York, where he took up the question of the education and housing of the poor. He founded the Children's Aid Society in 1853, and subsequently acted as its secretary; its annual income is about a quarter of a million dollars, and it has provided homes for over 60,000 children. He published notes of visits to Hungary (1852), Germany (1853), Norway (1857), and California (1869), besides *The Races of the Old World* (1863), *Gesta Christi* (1882), and other works. He died in the Engadine, 11th August 1890.

Bracelet (through Fr. from Lat. *brachium*, 'the arm'), a personal ornament, of different materials, worn on the arm, generally at the wrist. Bracelets and armlets (Lat. *armilla*) have been used by almost every nation, both savage and civilised, from the earliest periods to our own. In the text of the Old Testament there are three different words rendered by 'bracelet' in our authorised version. One of these probably means an armlet worn by men (Num. xxxi. 50, 2 Sam. i. 10); the second was a bracelet worn by women, and sometimes by men (Gen. xxiv. 22, Ezek. xvi. 11); the third a peculiar bracelet of chain-work, worn only by women (Isa. iiii. 19). That referred to in 2 Sam. i. 10 was an ornament that belonged to the king, like those famous armlets with their splendid diamonds which now form part of the regalia of the kings of Persia, and which are said once to have belonged to the Mogul emperors of India. The ancient Medes and Persians were remarkable, even amongst Asiatics, for their love of ornaments of this kind; and they were worn in Europe by the Gauls and Sabines. They do not seem to have been worn by men among the ancient Greeks, but Greek ladies wore both armlets and bracelets of the most various materials and forms. Some of these went round the arm twice or thrice, and a favourite form was that of a serpent. Many examples of this kind occur on painted vases. Amongst the Romans, armlets were not usually worn by men, but were frequently conferred upon soldiers for deeds of

valour (Livy, x. 44). Roman ladies wore bracelets, not only for ornament, but also for the purpose of containing amulets, as it is said that Nero wore on his right arm the skin of a serpent, inclosed in a golden armilla. Some of the early armlets of Scandinavia and Germany were evidently worn more for defence than ornament.

Braces, on shipboard, are ropes attached to the yard-arms, and employed to turn or swing the yards round.

Brach, or BRACHE, is an old name (originally French) for a scenting hound or other hunting dog.

Brachial Artery is the great arterial trunk supplying the upper extremity between the armpit and the elbow; in other words, it is the direct continuation of the axillary artery. It runs down the front and inner side of the upper arm, giving off several named branches as it proceeds, and at a point about an inch below the bend of the elbow it terminates by dividing into radial and ulnar arteries. In cases of arterial bleeding from wounds of the hand or forearm, the brachial artery may be compressed against the middle of the shaft of the humerus, just behind the inner margin of the biceps muscle. See ARM, ARTERY, CIRCULATION.

Brachiopoda, a class of shelled animals having certain affinities with worms and with Polyzoa, but less with molluscs, though often included within the limits of the last-named group. The presence of two shells gives them a superficial resemblance to true bivalves (Lamellibranchs), but the shells lie dorsally and ventrally instead of right and left, and the anatomy of the inclosed organism is quite different.

History.—Naturalists were for long content with placing Brachiopods beside *Anomia* or among Lamellibranchs. Forbes and others have shown that this is impossible, and the growing tendency, due to better acquaintance with their structure and to the researches of Morse, Kovalevsky, and others on their embryology, has been to regard them as specialised and passive Annelid types. Other suggestions have not been wanting, but there is now a general consensus of opinion in defining them as one of the many offshoots from the 'worm' branch of the genealogical tree. The Tunicata have been removed from any close alliance with Brachiopods, while the Polyzoa have come to be regarded as very closely allied.

Structure.—The external form of the animal certainly suggests that of an ordinary bivalve, but, as above noted, the position of the two valves is quite different. The size varies from considerably

Fig. 1.—*Rhynchonella psittacca* seen from the dorsal aspect (a) and from the side (b).

under half an inch to an inch, or rarely two inches in length. The shell consists of two distinct valves, the ventral usually larger than the dorsal, and each divisible into symmetrical halves. Where the valves unite, a perforated beak is often present. Through the hole of the beak a muscular bundle passes, serving in some cases for mooring the animal. The shell may be horny (among Discinidae and Lin-

gulidae), glassy, or massively limy. Its structure is very much simpler than that of ordinary bivalves, and often consists of a single layer, which, in the majority, is penetrated by skin processes, which possibly have a respiratory significance. These are absent in Rhynchonellidae and a few others, where the shell is therefore described as non-porous. The outer surface may be sculptured and coloured. The dorsal valve bears internally a limy ribbon of very varied shape, which forms the supporting organ of the respiratory apparatus. The ventral valve is in many cases provided with hinge teeth, which fit into depressions in the upper valve and lock the two halves firmly together.

The shell is secreted and lined by a delicate double membrane or mantle. Between the two layers there is a rich distribution of blood-vessels (the arterial system according to Huxley) which are connected with the body proper by two or four contractile heart-like organs. They communicate with the mantle-cavity, and with a chamber which occupies most of the body-cavity proper. The outer layer of the mantle next the shell often sends blind processes into canals which traverse the valves. The mantle is often strengthened by microscopic limy plates, and the margin very generally bears stiff bristles. The internal surface of the inner layer is ciliated. The body proper lies towards

Fig. 2.—Interior of the smaller (dorsal) valve of a Brachiopod shell (*Waldheimia*), showing the limy framework which supports the arms.

the hinge, and the large space between the two mantles is occupied by two large and exceedingly characteristic organs, which are probably respiratory, and certainly serve to waft little food-particles to the mouth. They consist of long tubes, bearing on one side movable cirri, and varying greatly in their degree of freedom and manner of twisting. In some cases these can be protruded through the open valves, in other cases they return upon themselves and are supported throughout by the limy ribbon above mentioned. They are tentacular, or labial organs, and arise from the outpulled margins of the mouth; in a few cases they are absent. The three or more pairs of muscles working the valves of Brachiopods are more complex than those of Lamellibranchs, and vary considerably in the two main divisions. The nervous system consists of a ring round the gullet, with superior and larger inferior pairs of ganglia, and of nerves regularly distributed to the various organs. Sense organs seem to degenerate in the very passive adults, but the young may possess eyespots, and sometimes also ear-sacs. The alimentary system consists of the inconspicuous mouth at the base of the long tentacles, of an ascending gullet widening into the stomach, of an associated digestive gland, and of an intestine which bends downwards, and either ends blindly or in an anus on the right side anteriorly. The respiratory system, as already noticed, probably consists of the processes from the mantle and of the tentacular arms, but further researches are necessary to make this certain. The vascular system between the mantle-layers has been already noted. The heart is usually described as a pear-shaped organ above the stomach, supplied by a main vein, and giving off

two arteries. The *excretory system* consists of a pair of tubes (compare segmental organs of other Invertebrates) to the right and left of the gut, opening internally into the body-cavity, and externally into the space between the two mantle-flaps. In *Rhynchonella psittacca* a second pair is present. These tubes serve also for genital ducts. The *reproductive system* is usually represented in one division by two pairs of glands, situated in sacs from the body-cavity into the mantle-cavity, and in the other division by glands near the coils of the gut. In the former the sexes are separate, in the latter the glands are hermaphrodite.

Mode of Life.—The adult Brachiopods are excessively passive organisms. Some are fixed by whole or part of their ventral valves, others seem to have been anchored in the mud by long spines, while a few are stalked either for life or in their earlier stages. The lamp-shell *Lingula*, with the longest stalk, is at the same time, as one would expect, one of the least limy, and has in fact a horny shell. *L. pyramidata* has been shown by Morse to have the power of moving along the sand, and *Terebratulina caput serpentis* has also considerable power of moving on its stalk. The nadir of passivity as expressed in enormously thick limy shells is well illustrated by the very large and massive fossil *Productida*. The food seems largely to consist of diatoms, but the *Lingulidae* are also known to sweep in small crustaceans and abundance of mud. They are all marine, and attach themselves to rocks, corals, molluscs, &c.

Development.—The eggs may be laid externally, or develop within the ducts, or in *Thecidium* in a special brood-chamber. The segmented larvæ, which in some cases show marked affinities with Chætopod worms, are free-swimming and very unlike the adults. They fix themselves by their posterior portion, lose their anterior sensory region, and form the body out of the rest.

Distribution in Space.—The Brachiopods are widely distributed, but are at the same time much localised. In favourite haunts they occur in great numbers. *Lingula* abounds at above half-tide mark, while the more abundant limy forms go down to very great depths—as far as 2600 fathoms. The horny forms are fonder of warm and tropical, the limy of cold and temperate waters.

Distribution in Time.—The Brachiopods furnish a striking illustration of a moribund class. In former periods they were vastly more numerous. The hingeless forms appear first, soon accompanied by hinged types, in the Cambrian strata; in Silurian times they were exceedingly numerous; in the Devonian was their golden age. In the Carboniferous strata they are much rarer, and still more so in the Dyas. They increase again in the Jurassic, and reach another climax, sinking again in the Chalk, and gradually dwindling to the presently existing residue. Of the 125 genera and 2600 species, 17 genera and 110 species are still extant—a striking instance of decadence, which may in part be due to their extreme passivity, and also to the number of relatively trivial characters so often connected with this state. *Lingula* and some others have persisted from the earliest times.

Classification.—The Brachiopods are often divided into two orders of Testicardines and Ecardines, respectively with and without hinges. In the former it may be further noted that the shell is always limy, the mantle-flaps are united posteriorly, the gut ends blindly. In the latter the shell may be horny, there is no arm skeleton, the mantle-flaps are always separate, the gut has an anal aperture. *Terebratula*, *Thecidium*, *Stringocephalus*, *Rhynchonella*, *Spirifer*, *Srophomena*, and *Productus* are examples of the various families of the

former; *Crania*, *Discina*, *Obolus*, and *Lingula* of the latter. The absence or presence of an anus, in regard to which there is a good deal of reasoning from analogy in default of observation, is expressed in another couple of names—*Clistenterata* for the former sub-class, *Tretenterata* for the second. The terms *Articulata* and *Inarticulata* refer to the same twofold division, and emphasise the presence or absence of the locking hinge. The two terms *Testicardines* and *Ecardines* are, however, generally adopted. It has been proposed to erect a third division—*Abrachia*—for a few armless forms, in which these characteristic organs are replaced by a tentacular sheath formed from the mantle. In other respects they resemble *Testicardines*. For further information, see T. Davidson, *Fossil Brachiopoda* (1859), *Challenger Reports*, Huxley's *Invertebrates*, and other text-books.

Brachyptera (i.e. 'short-winged'), an ornithological term sometimes applied to such peculiarly aquatic birds as auks, pullins, penguins, grebes, guillemots, and divers proper (*Colymbus*). The term Divers (q.v.) is often used with the same meaning.

Brachyura, a technical name applied to the short-tailed decapod crustaceans or crabs, in contrast to the long-tailed forms like the lobsters, where the abdomen is not tucked in on the under surface in the characteristic crab fashion. The term is also applied to a family of bats, including *Mystacina* and *Noctilio*, in which the tail is very short.

Bracken, or **BRAKE**, a large genus of Ferns of the division Polypodeæ, distinguished by spore-cases in marginal lines covered by the reflexed margin of the frond. It is very widely distributed from arctic and temperate to tropical countries. The Common Brake or Bracken (*Pteris aquilina*) is the largest, commonest, and handsomest of European ferns, often covering considerable tracts in woods and parks, or on heaths and hills. It has a long, creeping, black rhizome, or root-stock, behind the apex of which a new frond arises annually. The fronds are bipinnate, but the first two pinnae are as large as the remainder of the frond, which is moreover bent into the same horizontal plane, so producing a three-branched appearance, which is very characteristic. The fibro-vascular bundles of the stalk of the frond, when cut across, exhibit an appearance slightly resembling a spread eagle, whence the specific name *aquilina* (Lat. *aquila*, 'an eagle'); while the two dark strands of sclerenchyma in the root-stock suggest the letters J C, whence the medieval name of Christ-root, and a character of sanctity confirmed by the crozier-like unrolling of the fronds in spring. The root-stock is bitter, and has been used as a substitute for hops; it has also been ground, mixed with barley,

Common Brake :

a, end of a branch, much reduced; b, end of a pinna, lower side, showing fructification.

and made into a wretched bread in times of distress. It was of importance as a food-supply in Teneriffe, furnishing the so-called Helecho-bread. The plant is astringent and antihelmintic; and as such, it had at one time a high reputation in medicine, and was also employed in dressing kid and chamois leather. The ashes were formerly used in the manufacture of soap and glass. Bracken is also employed for thatching, for littering cattle, for manure, &c., and has been chopped up with straw or hay for feeding cattle. It is a favourite covert of deer and of other game. The abundance of this plant is sometimes regarded as a sign of poor land, although, probably, its absence from the richer soils is very much a result of cultivation. To extirpate it, nothing more is necessary than a few successive mowings of the young shoots as they appear. The annual growth of brake is killed by the first frosts of autumn, but remains rigid and brown, still affording shelter to game, and almost as characteristic a feature in the landscape of winter as in that of summer.—*Pteris caudata*, a large species of brake very similar to that of Europe, is one of the worst pests which the farmer has to contend with in the south of Brazil.—*Pteris esculenta*, a native of New Zealand, Tasmania, &c., has a more nutritious rhizome than the common brake (see TARA FERN).—*Pteris serrulata* of India, China, and Japan is largely used as a table decoration on account of its grace and hardness.

Bracket, an ornamental projection from a wall, used for the purpose of supporting a statue, bust, or the like (see CORBEL). Brackets are either of stone, wood, or metal, and they are sometimes

Ornamental Brackets.

elaborately designed and carved. The term bracket is also employed in joinery, &c., to designate supports, in the form of a bent knee, of shelves, galleries, &c. Bracket is also generally applied to such gaslights as project from the wall.

Bracklesham Beds, a group of highly fossiliferous strata in the middle Eocene formation, included in the Bagshot series (q.v.).

Bract is a term applied to any leaf from the axil of which a flower or a floral axis is produced, instead of an ordinary leaf-bud or branch. In some cases the bracts present no marked differences from other leaves (e.g. Belladonna), and such flowers are then often termed axillary, meaning in the axils of unmodified leaves. In the great majority of cases, however, the familiar antithesis between vegetation and reproduction is strongly marked, the size and vegetative development of the leaf being greatly checked; thus the bract is usually small and entire, even though the vegetative leaves may be large and divided. They often exhibit an interesting gradation between leaves and petals, for the coloration of the flowers, which is so often evident for some distance down the flowering axis, may extend more or less completely to the bract; and this may

go so far as to completely replace floral magnificence altogether, as in the Poinsettia and Bougainvillea (q.v.) of our greenhouses. The subordination of vegetative life may go so far as to suppress the parenchyma altogether at a very early age, leaving only a dead membranous structure, brown and wizened in the bract or spathe of the daffodil, or glossy and bright coloured in the immortelle and other so-called everlasting flowers. Finally, in Cruciferae the bracts have disappeared in the great majority of species; yet in exceptional cases (particularly in double or otherwise highly vegetative specimens), their entire or partial reappearance shows that the apparent anomaly of their absence in this family is only the extreme case of a physiological contrast which is perfectly normal. It will be noticed that the term is applied (1) to bracts proper, each subtending a single flower; (2) as in Composite, to the crowded leaves of the axis below the similarly crowded inflorescence (in which, however, true bracts subtending the florets also often occur—e.g. Zinnia, &c., also in Dipsacaceae); (3) to the leaf subtending an entire inflorescence, which may be either free-growing, with minor bractlets (palm), or compressed, as in the spadix of Araceae. Such a bract is termed a *spathe*.

Bracton, HENRY DE, English ecclesiastic and jurist, of whom but little certain is known save that he was a 'justice itinerant,' in 1264 became archdeacon of Barnstaple and chancellor of Exeter Cathedral, and died in 1268. He is memorable as one of the earliest writers on English law, his *De Legibus et Consuetudinibus Anglie* being indeed the first attempt at a systematic treatment of the body of English law. Coke and Selden valued the work highly, and Milton quotes from it in his *Defence of the People of England*. The first printed edition of the entire work appeared in folio in 1569. A revised text and translation was edited by Sir Travers Twiss in the 'Rolls Series' (6 vols. 1878-83). In 1887 Mr F. W. Maitland published a *Collection of Cases* (3 vols.), accompanied by a series of strong and almost conclusive arguments that this was the actual collection of cases on which Bracton's great treatise was founded.

Braddock, EDWARD, a British general, born in Perthshire, Scotland, about 1695, entered the Coldstream Guards in 1710, and was appointed major-general in 1754. Nine months later he sailed as commander against the French in America, and with a force of nearly 2000 British and provincial troops, reached the Monongahela, a branch of the Ohio, on July 8, 1755. Leaving the baggage behind, on the 9th he pushed forward with a chosen force to invest Fort Duquesne, on the present site of Pittsburg, Pennsylvania. In spite of his obstinacy, he appears to have so far regarded the warnings of his American officers that he threw out flank and advance parties to guard against a surprise. He twice forded the Monongahela in order to avoid a dangerous defile; and it was on the right bank of the river that his advance guard was attacked by a party of about 900 French and Indians from the fort. Properly speaking, Braddock fell into no ambushade; but the dense cover of the forest, of which the Indians immediately took advantage to surround his force, and his dogged insistence on his men fighting in line, instead of imitating the tactics of the foe, exposed the British as a helpless living target to a withering fire, to which they could make none but a desultory and uncertain return. After two hours' fighting, in which Braddock, whose bravery was never called in question, had four horses shot under him, and was mortally wounded while vainly trying to rally his men, the survivors made a hasty retreat under Washington, Braddock's aide-de-

camp, the only one of his staff who escaped unhurt. No less than 63 out of 86 officers, and 914 out of 1373 men engaged, were either killed or wounded. The French loss was trifling. Braddock was carried from the field, and died July 13, 1755, at Great Meadows, about 60 miles from the scene of his fatal surprise. See Winthrop Sargent's monograph (Philadelphia, 1855), and Parkman's *Montcalm and Wolfe* (1884).

Braddon, MARY ELIZABETH (Mrs John Maxwell), novelist, was born in Soho Square, London, in 1837, the daughter of a solicitor. She very early showed a turn for literature, which she indulged in the usual manner, by sending verses and other trifles to the magazines and newspapers. Neither a comedietta brought out at the Strand in 1860, a volume of verse, nor one or two novels, had had much success, when, in 1862, *Lady Audley's Secret*, the story of a golden-haired murderess, attained an enormous popularity, in three months reaching its eighth three-volume edition. *Aurora Floyd* (1863) was little less popular. Of all her fifty novels, perhaps the best is *Ismael* (1884), a tale of the Second Empire, which depends not so much on sensation as character. Several of them appeared in *Temple Bar*, *St James's Magazine*, and *Belgravia*, a magazine of which she was for some years editor. Mainly her works depend for their interest on incident, and the art of their appeal to 'that low vice, curiosity,' in the conduct of a story carefully leading up to some suspended and unforeseen *dénouement*. In their particular way, they display undoubted talent: in style, they are fresh and vigorous, and their narrative power strongly excites the reader's interest.

Bradford, an important manufacturing town and parliamentary and municipal borough in the West Riding of Yorkshire, on a tributary of the Aire, at the meeting of three vales, 9 miles W. of Leeds, 34 SW. of York, and 191 NNW. of London by rail. Besides very convenient railway communication, there is a branch canal in connection with the Liverpool and Leeds Canal. It is said to derive its name from a ford over the river here called Broad Aire, or from *bræc*, 'a hill,' and *ford*. The area of the ancient parish is 34,146 acres, and includes 13 townships. Bradford in 1832 was created a parliamentary borough, returning two members. It became a municipal borough in 1847, and is governed by a mayor, 15 aldermen, and 45 councillors. The municipal borough was extended in 1873 and again in 1882, and the parliamentary borough made continuous with it in 1885. For parliamentary purposes it is now divided into 3 districts, each returning one member. The corporation has been noted for its activity and spirit of improvement shown in beneficial local acts; in the execution of main drainage-works, the remodelling of portions of the town, its splendid water-works, and the acquirement of the gas-works (1871). Bradford is the chief seat in England of the spinning and weaving of worsted yarn, and the great mart for the long wools used in worsted fabrics. It has developed of late worsted coating, velvet, and plush industries. The first mill was built in 1798; there are now more than 300 mills, employing a large population. There are great merchants' warehouses for worsted goods; also a 'conditioning-house' (the only one in this country), established by the corporation in 1887 for the weight, measure, &c. of such goods. Manningham Mills, for silk and velvet, erected at a cost of £500,000, are among the most extensive in the kingdom. For the alpaca and mohair industry in the neighbourhood, see also SALT (SIR TITUS), SALTAIRE. Coal and iron mines occur near Bradford, and the ironworks at Bowling and Lowmoor are very large and important; the making of machinery is a considerable

industry; and stone is exported from quarries in the neighbourhood. There are 30 churches belonging to the establishment in the borough, and more than 80 Dissenting churches. The parish church of St Peter is a fine building in the Perpendicular style, with a tower of later date, and contains a number of interesting monuments. It has a town-hall (1873) of medieval design, which cost over £100,000, with campanile tower, and carillon chimes; mechanics' institute (1870); St George's Hall (1853); exchange (1867); extensive wholesale and retail markets, which have cost £150,000, exclusive of an annual rental of £5000 a year for market rights; grammar-school; technical college (1882); free library (1872); new post-office, a fine building in the Italian style (1887); and two court-houses. The gross rateable value of the borough was in 1887 £965,231. It has five public parks, Peel Park, with an area of 56 acres; Lister or Manningham Park (56 acres), Horton Park (39 acres), Bowling Park (53 acres), and Bradford Moor Park (15 acres), and also many excellent charities. The early history of Bradford is connected with the De Lacies, in whose hands the manor remained until the beginning of the 14th century, when it passed by marriage to the Lancaster family. On the death of John of Gaunt, in 1399, it was afterwards held by the crown till the reign of Charles I., who sold it to the corporation of London. After being held by the Marsdens and the Rawsons, the manorial rights were leased by the corporation. In the civil wars, the people of Bradford took the parliament side, and twice defeated the royalists, but were afterwards themselves defeated by the Earl of Newcastle. The worsted trade, introduced to Bradford at the end of the 17th century, has made rapid progress since the era of the steam-engine. In a riot at Bradford, against the introduction of worsted power-looms, in 1826, two of the rioters were shot dead by the defenders of the mill which contained the obnoxious machinery, and many more were wounded. In 1825 a strike for increased wages, in which 20,000 persons were concerned, lasted six months. The Baptists had a college here, which has been removed to Rawdon, 6 miles distant, and the Independents have Airedale College. This town is the seat of the first English temperance society. The National Association for Promoting Social Science met here in 1859, and the British Association in 1873. The merchants of Bradford are distinguished by their liberality and enterprise, the names of the Listers and the Salts being conspicuous. Statues of Sir Robert Peel, Richard Oastler, Sir Titus Salt, S. C. Lister, and W. S. Forster (1890) adorn the town. The population of the municipal borough in 1881 was 183,032, the population of the same area in 1871 being 145,830. The population of the area now composing the municipal and parliamentary borough, in 1881 was 194,495; in 1891, 216,361. The local government measure of 1888 constituted Bradford a county by itself. See James's *History of Bradford* (2 vols. 1841-66).

Bradford, a town of McKean county, Pennsylvania, 65 miles S. of Buffalo, with oil-wells and sawmills. Pop. 10,514.

Bradford Clay, a subdivision of the Great Oolite (Lower Oolite), is a blue unctuous clay, occurring at Bradford, near Bath, and extending for a few miles around: it is about 10 feet thick at Bradford, but may be thicker at Farleigh. It is remarkable for the occurrence in it of large numbers of a Crinoid (q.v.), *Apicrinites Parkinsoni*. The upper surface of the calcareous rock on which the clay rests is completely incrustated over with a continuous pavement formed of the stony bases of this crinoid. It had once formed the bottom of a sea,

in which these animals lived, their stems bending with every motion of the water, and their star-like crown of arms outstretched in search of food. At length, however, the clear water was invaded by a current largely charged with mud, which threw them down, and broke most of their stems off near the base. The stem, body, and arms have been dismembered, and are confusedly scattered through the clay. Although Bradford Clay is considered a local deposit, yet deposits containing the same fossils occur in Dorsetshire.

Bradford-on-Avon (Sax. *Bradanford*, 'broad ford'), a town of Wiltshire, on both sides of the Avon, and on the Kennet and Avon Canal, 9 miles SE. of Bath. It is an ancient town, and still shows some gable-fronted houses, built and roofed with stone. Formerly it was the seat of important woollen manufactures, and kerseymers were first made here. The tiny church of St Lawrence, built by St Aldhelm (q.v.) between 675 and 709, is the only perfect building of pre-Norman times now remaining in England. Only 38 feet long, it consists of a nave, chancel, and north porch; the most striking feature of the interior being the narrowness of the chancel-arch, which is not more than 3 feet across. It had been used for two centuries as a school and dwelling-house, when in 1856 it was rescued from profanation; and it has since been put in a state of thorough repair. Hard by, on the site of Aldhelm's monastery, is the parish church of the Holy Trinity, of various dates from the 12th to the 16th century, and restored in 1865-66. On the summit of Torr Hill are the ruins of a 14th-century chapel of the Virgin; and the town bridge retains its desecrated chapel. In the neighbourhood is the pleasant valley of Avon, with many picturesque spots. At Bradford, Cenwalh, king of the West Saxons, gained a great victory over the Welsh in 652. Pop. 4957. See an article in the *Saturday Review* for 11th September 1886.

Brading, a small but ancient town, once a parliamentary borough, in the Isle of Wight, 4 miles S. of Ryde by rail. The place can still show its stocks and bull-ring; and in 1880 the remains of a Roman villa, with a tessellated floor, were unearthed near the town. In the ruins, assumed to be those of the villa of the Roman governor, were found numerous coins and tiles; there are also traces of a whole row of buildings.

Bradlaugh, CHARLES, a prominent social reformer, but vigorous anti-socialist, was born in London in 1833. He had early to shift for himself, and was in turn errand-boy, small coal-merchant, and trooper at Dublin. Procuring his discharge, he returned to London in 1853, became clerk to a solicitor, and ere long a busy secularist lecturer, and pamphleteer under the name of 'Iconoclast.' His voice was heard in all popular causes, alike on platforms throughout the country and in the pages of his organ, *The National Reformer*; but in 1880 his name assumed a new importance on his being elected M.P. for Northampton. He claimed to make affirmation of allegiance in lieu of taking the parliamentary oath: but after the report of two select committees, the House refused to allow him either to make oath or to affirm. He continued his struggle with the House, was thrice re-elected by Northampton, and at length, in 1886, having taken the oath, he was allowed to take his seat. In parliament he gained respect by his strong sense and debating power, and he earned wide popularity by his agitation against perpetual pensions. Of his writings the best known is the *Impachment of the House of Brunswick*. His republication, in conjunction with Mrs Annie Besant, of an old pamphlet, *The Fruits*

of Philosophy—a proposed solution for the over-population question—led in 1876 to a sentence of six months' imprisonment and a £200 fine, but the conviction was quashed on appeal (see OATH). See his Life by his daughter, Mrs Bonner and J. M. Robertson (1894). He died 30th January 1891.

Bradley, REV. EDWARD ('Cuthbert Bede'), was born at Kidderminster in 1827, and educated at Durham University. He was successively rector of Denton, Huntingdonshire, of Shelton, near Oakham (1871-83), and of Lenton, near Grantham. His facetious description of Oxford life in *Adventures of Verdant Green* (1853-57) has been exceedingly popular, and was followed by the *Book of Beauty* (1856), *Fairy Fables* (1858), *Glencraggon* (1861), *Tales of College Life* (1862), *Little Mr Bonner and his Friend Verdant Green* (1873), *Fotheringhay* (1885), &c. He died 11th December 1889.

Bradley, JAMES, astronomer, was born at Sherborne, Gloucestershire, in 1693; from North-leach grammar-school passed in 1711 to Balliol College, Oxford. The scientific bent of his mind was moulded and directed by his uncle, the Rev. James Pound, of Wanstead, Essex, and in conjunction with him his first discoveries were made. Devoting himself to mathematics and astronomy, he soon exhibited such a genius for these pursuits as won him the friendship of all the leading mathematicians of his time, including Halley and Sir Isaac Newton, and secured his election to the Royal Society in 1718. In 1719 he obtained the vicarage of Bridstow, and in 1720 a sinecure rectory in Pembrokehire; but he resigned both in 1721 on his election to the Savilian professorship of Astronomy at Oxford. In 1729 he published his theory of the aberration of the fixed stars, containing the important discovery of the aberration of light—suggested by the observation that the vane of a boat in which he was sailing on the Thames in 1728 never lay in the line of the wind, but was always inclined to it at an angle depending on the line and amount of the boat's motion. See ABERRATION, and ASTRONOMY. Three years after this publication Bradley became lecturer on Astronomy and Physics at the Oxford Museum. His next discovery, published in 1748, after twenty years' research, was that the inclination of the earth's axis to the ecliptic is not constant, a fact including the explanation of the precession of the equinoxes and the nutation of the earth's axis. In 1742 Bradley succeeded Halley as regius professor of Astronomy at Greenwich, where, by his observations, he still further enriched the science. His refusal of the vicarage of Greenwich was compensated in 1752 by a crown pension of £250 a year. He died at Chalford, Gloucestershire, 13th July 1762. Bradley is described as having been gentle, modest, compassionate, and liberal; little given to speaking or writing, from diffidence and the fear of hurting his reputation. He has been called the founder of observational astronomy, and no man ever better merited the title of a great astronomer. His astronomical observations, which numbered about 60,000, fill two folio vols. (1798-1805). Bessel was able in 1818, from Bradley's labours, to deduce a catalogue of 3222 stars for the epoch of 1755. See Rigand's *Miscellaneous Works and Correspondence of Bradley, with Memoir* (1832).

Bradshaw, JOHN, regicide, was born near Stockport, of a good Cheshire family, in 1602, and in 1627 was called to the bar at Gray's Inn. 'He practised,' says his friend Milton, 'with singular success and reputation'; still, he was little known when, on 13th January 1649, he was, in default of a more able lawyer, appointed president of the high

court of justice for the trial of Charles I. On that solemn occasion his manners were as short as his speeches were lengthy. For reward he was made permanent president of the Council of State, and Chancellor of the Duchy of Lancaster, with a grant of estates worth £2000 per annum. His 'still republican' embroiled him with Cromwell, who twice attempted to deprive him of his office of chief-justice of Chester; but there is no direct proof that he ever engaged in the Fifth Monarchy and other plots. After Oliver's death he was appointed a commissioner of the Great Seal; and his last public act was to protest against the violent seizure of Speaker Lenthall by the army. He died 22d November 1659; and his body was buried with pomp in Westminster Abbey, but after his posthumous attainder, it was disinterred and hung on a gibbet, with those of Cromwell and Ireton.

Bradshaw's Railway Guide, the pioneer of its class, derives its name from George Bradshaw (1801-53), originally a map-engraver in Manchester, who on 19th October 1839 commenced the issue of an occasional work, called *Bradshaw's Railway Time-tables* (a name changed in 1840 to *Railway Companion*), which was corrected by a monthly time-sheet. This sheet was frequently delayed to the 5th or 6th of the month, and was subject to changes made by the Companies, perhaps in the middle, or even the latter end of the month. By great efforts, the railway companies were induced to consent to adjust their tables, once for all, for the beginning of each month; and the first number of the monthly *Railway Guide* was brought out in December 1841, though the *Companion* survived till 1845. The second number of the *Guide*, published '1st month (January) 1842,' runs to 32 pages, and contains 42 or 43 lines of railway, in England only, without any advertisements (T. Madan in *Athenæum*, 24th December 1887). The *Guide* now extends to upwards of 450 pages, and gives copious information regarding all lines in the three kingdoms, besides much about steamboats and coaches, with advertisements. Its plan has been imitated at home and abroad. In 1847 the first number of *Bradshaw's Continental Railway Guide* was issued, which, in addition to the tables, contains a large quantity of topographical information. A series of *handbooks* was also issued by Mr Bradshaw. See an article in the *Cordell* for April 1888.

Bradwardine, THOMAS, was born in England not later than 1290. His birthplace is uncertain; in his chief work he mentions that his father lived at Chichester. He studied theology, philosophy, and mathematics with distinguished success at Merton College, Oxford, and in 1325 was one of the proctors of the university. His fame as a theologian was founded on the theological lectures he delivered for a series of years at Oxford, and now rests on his *De Causa Dei contra Pelagianum, et de virtute censuram, libri tres* (edited by Henry Savile, Lond. 1618), an able defence of the Augustinian doctrines of grace, fully proving his right to the scholastic title of 'Doctor profundus.' Called to the court of Edward III. by Stratford, Archbishop of Canterbury, he became confessor to the king, canon of Lincoln, and chancellor of the cathedral church of St Paul in London. From 1339 he accompanied Edward III. on his campaigns in France. On the death of Stratford in 1348, Bradwardine was elected his successor by the chapter of Canterbury. The king and the pope preferred John Ufford; but Ufford dying in May 1349, before he had been consecrated, Bradwardine was appointed archbishop, and was consecrated in July by Cardinal Bertrand at Avignon. Returning to England, he died on the 26th August in that

year. Bradwardine wrote also *Arithmetica Speculativa* (Paris, 1502); *Geometria Speculativa* (ib. 1512); and a *Tractatus Proportionum* (Venice, 1505).

Brady, NICHOLAS, with Nahum Tate, versifier of the Psalms, was born at Bandon, County Cork, in 1659. He was educated at Westminster, Christ-Church (Oxford), and Dublin, and held from 1696 to his death in 1726 the living of Richmond, Surrey, along with the rectories of Stratford-on-Avon and Clapham in succession. He also kept a school at Richmond, honoured by the approval of Richard Steele. Tate and Brady's metrical version of the Psalms was authorised in 1696, but with the strong opposition of many among the Tory clergy. His tragedy, *The Rape, or the Innocent Imposters*, his blank verse *Eneid*, and his sermons have long since sunk into the oblivion they deserved.

Bra'dypus. See SLOTH.

Braemar, a Highland district, occupying the south-west corner of Aberdeenshire (q.v.), in the heart of the Grampian Mountains, and traversed by the upper waters of the Dee. In the east part is Balmoral (q.v.); and near its centre, 61 miles W. by S. from Aberdeen, is the small village of Castleton of Braemar, a favourite resort for travellers, sportsmen, and lovers of grand scenery. Here in 1715 the Earl of Mar raised the Pretender's standard. See Crombie's *Braemar* (2d ed. 1875).

Brag, a game at cards, so called because each player endeavours to impose upon the others, and to make them believe that his hand is better than it really is. A sum of money is usually staked, and the cards being compared, the best hand wins.

Braga, a city of Portugal, capital of the province of Minho, is situated on an eminence between the rivers Cavado and D'Este, 34 miles NE. of Oporto by rail. It is the residence of the primate of Portugal, who has a palace here. It has also a fine Gothic cathedral (12th century), partly modernised, the church of Santa Cruz (1642), and manufactures of linen, hats, cutlery, firearms, jewelry, &c. The *Bracara Augusta* of the Romans, it retains ruins of a temple, an amphitheatre, and an aqueduct. Near it is the celebrated *Santuário do bom Jesus do Monte*, which is still a place of pilgrimage. In the 6th century Braga was the chief city of the Sævi, and it fell successively into the hands of the Goths and Moors, from the latter of whom it was taken by Alphonso of Castile. Pop. 19,755.

Bragança, the name of two considerable towns in Brazil.—(1) Bragança, a seaport, 100 miles NE. of Para, at the mouth of the Caete, which is here navigable to the town. Pop. of town and district, 6000.—(2) Bragança, an inland city of about 10,000 inhabitants, 50 miles to the NE. of São Paulo.

Braganza, or BRAGANÇA, a city of Portugal, capital of the province Traz-os-Montes, on the Fervença, 26 miles NW. of Miranda. It has an upper and lower town, the former being surrounded with walls; has a citadel, a college, a hospital, is the see of a bishop; and has manufactures of silk and velvet. This city gives its name to the House of Braganza, the present ruling dynasty in Portugal, John, 8th Duke of Braganza, having ascended the throne as John IV. in 1640, when the Portuguese liberated themselves from the Spanish yoke. His daughter, Catherine of Braganza, was the queen of our Charles II. See PORTUGAL. Pop. 5495.

Bragg, BRAXTON, Confederate general, born in North Carolina, 22d March 1817, graduated at the United States military academy in 1837, served in

the artillery through the Seminole and Mexican wars, rising by successive brevets for gallantry in action to the rank of lieutenant-colonel, and retired in 1856. He commanded in several great battles of the civil war, and was for a time military adviser to the Confederate president. He died in Galveston, Texas, 27th September 1876.—His brother, THOMAS, born in 1810, was governor of North Carolina, 1854-58, United States senator, 1859-61, and attorney-general in Jefferson Davis' cabinet, 1861-63. He died in Raleigh, 21st January 1872.

Bragi, in Northern Mythology, son of Odin and Frigga, god of poetry and eloquence. Upon his tongue were engraved the runes of speech, so that he could not utter a sentence that did not contain wisdom. According to the elder or poetic Edda, he is the most perfect of all scalds or poets, and the inventor of poetry, which is designated by a kindred word, *bragr*. Unlike Apollo, who in the Greek mythology enjoys eternal youth, Bragi is represented as an old man with a long flowing beard; but his brow is always mild and unwrinkled. His wife's name is Idunna. Together with Hermodr or Hermode, he receives and welcomes all those heroes who have fallen in battle, on their arrival in Valhalla. On festive occasions, as well as on the burial of a king, a goblet, called Bragafull (Bragi's goblet), was presented, before which each man rose up, made a solemn vow, and emptied it.

Braham (i.e. ABRAHAM), JOHN, tenor singer, born in London of German-Jewish parents, about 1774, and left an orphan at an early age, is said to have for a time sold pencils in the streets. Leoni, a chorister of Duke's Place synagogue, adopting him, gave him instruction in music and singing; he appeared at Covent Garden in 1787, but his first great success was at Drury Lane (1796). He had an unusually long professional career, and continued to make occasional appearances at concerts until within a few years of his death. To study singing he visited France, Italy, and Austria (1797-1801), in company with one Nancy Storace, singing at Paris, Florence, Milan, Venice, and Vienna; his triumph on his return was transcendent, and thenceforward, for half a century, he held the reputation of one of the greatest tenor singers in Europe. In 1809 he had an engagement at the Royal Theatre, Dublin, for fifteen nights, at 2000 guineas. He acquired a large fortune during his professional career, much of which was squandered by his purchase of the Colosseum, in Regent's Park, for £40,000; and the building of St James's Theatre, at a cost of £30,000. He died at Brompton, 17th February 1856. In Sir Walter Scott's words, Braham 'was a beast of an actor, but an angel of a singer;' and it was as a concert-singer that he most excelled, his great declamatory power and florid execution giving a wonderful effect to his rendering of the national songs, especially his 'Death of Nelson' (1811). Most of his operas were produced at Drury Lane; but his own compositions were of the feeblest description, rendered only tolerable by the embellishments introduced in singing them. One of his daughters, Frances, in 1840 married the Earl of Waldegrave. She was for many years a leader of society, and died 5th July 1879.

Brahé, TYCHO, one of the most distinguished names of which astronomical science can boast, was born at Knudstrup, near Lund, in the south of Sweden, 14th December 1546. He was descended from a noble family, and was sent at the age of thirteen to the university of Copenhagen, where he had not been more than a year, when an eclipse of the sun turned his attention to astronomy. His uncle, who destined him

for the law, furnished him with a tutor, and sent him to Leipzig in 1562; but Brahé, who cared nothing for that study, devoted just so much time to it as would save appearances, and while his tutor slept, busied himself nightly with the stars. By these surreptitious observations of the heavens, and with no other mechanical contrivances than a globe about the size of an orange, and a pair of rude compasses, he succeeded, as early as 1563, in detecting grave errors in the Alphonsine tables and the so-called Prutenic (i.e. Prussian) tables, and set about their correction. The death of an uncle, who left him an estate, recalled him to his native place in 1565; but he very soon became disgusted with the ignorance and arrogance of those moving in the same sphere with himself, and went back to Germany. At Wittenberg, where he resided for a short time, he lost part of his nose in a duel with a Danish gentleman; but for the lost organ he ingeniously contrived one of gold, silver, and wax, which fitted admirably. After two years spent in Augsburg, he returned home, where in 1572 he discovered a new and brilliant star in the constellation Cassiopeia. In 1573 he married a peasant girl, and this his fellow-noblemen thought even more undignified than being addicted to astronomy; that too they considered very degrading in a gentleman, and the king was obliged to interpose in order to reconcile them. After some time spent in travel, Brahé received from his sovereign, Frederic II., the offer of the island of Hven or Hoëne, in the Sound, as the site for an observatory, the king also offering to defray the cost of erection, and of the necessary astronomical instruments, as well as to provide him with a suitable salary. Brahé accepted the generous proposal, and in 1576 the foundation-stone of the castle of Uranienborg ('fortress of the heavens') was laid. Here James VI. of Scotland paid him a visit when on his way to Denmark to marry the Princess Anne, and wrote some verses in his honour, and here for a period of 20 years Brahé prosecuted his observations with the most unwearied industry—with a zeal, in fact, sufficient to create a new epoch—one of the three great epochs indeed—in astronomy as a science of observation. See ASTRONOMY, COMET. The scientific greatness of Brahé was no protection against the petty prejudices of the nobles. So long as his munificent patron, Frederic II., lived, Brahé's position was all that he could have desired, but on his death in 1588 it was greatly changed. For some years under Christian IV., Brahé was just tolerated; but in 1597 his persecution had grown so unbearable that he left the country altogether, having been the year before deprived of his observatory and emoluments. After residing a short time at Rostock and at Wandsbeck near Hamburg, he accepted an invitation of the Emperor Rudolf II.—who conferred on him a pension of 3000 ducats—to Benatek, a few miles from Prague, where a new Uranienburg was to have been erected for him; but he died at Prague on the 24th October 1601. At Benatek he had Kepler as his assistant, and to the advice of Brahé that celebrated astronomer owed much. The scientific publications of Brahé are numerous. His complete works appeared at Prague in 1611; his Letters have been edited by Frijis (Copenhagen, 1876); and there are Lives of him by Gassendi (Latin, 1655), Frijis (Danish, 1871), and Dreyer (English; Edin. 1890). See also Brewster's *Martyrs of Science* (1841).

Brahilov. See BRAILA.

Brahma. In the religion and philosophy of the Hindus, this word has two meanings. The crude form is *brahman*, the etymological signification of which seems to be *expansion*, with the

secondary meaning of *religious devotion*. Brahmā (neuter) designates the universal Spirit, the ground and cause of all existence; which is not, however, conceived as an individual personal deity to be worshipped, but only as an object of contemplation. It is spoken of as 'that which is invisible, unseizable, without origin, without either colour, eye, or ear, eternal, manifold (in creation), all-pervading, undecaying—the wise behold it as the cause of created beings.' The human soul is a portion of this universal Spirit, and a man can only be freed from transmigration, and be reunited to Brahmā, by getting a correct notion of it and of the soul. —Brahma (masculine) signifies an *offerer of prayer*, a *priest*, as well as the Supreme Being regarded as a person. In the later mythology he became the chief god of the Hindu pantheon, and is specially associated with the function of creation (see TRIMURTI). Yet he himself is a creation of or emanation from Brahmā, the First Cause. The origin of Brahmā, and the way in which he created heaven and earth, is thus narrated by Manu:

'This universe was enveloped in darkness, unperceived, undistinguishable, undiscoverable, unknowable, as it were entirely sunk in sleep. Then the irresistible self-existent Lord, undiscerned, causing this universe with the five elements, and all other things, to become discernible, was manifested, dispelling the gloom. He who is beyond the cognisance of the senses, subtle, undiscernible, himself shone forth. He, desiring, seeking to produce various creatures from his own body, first created the waters, and deposited in them a seed. This [seed] became a golden egg, resplendent as the sun, in which he himself was born as Brahmā, the progenitor of all the worlds. Being formed by that First Cause, undiscernible, eternal, which is both existent and non-existent, that Male (purusha) is known in the world as Brahma. That lord having continued a year in the egg, divided it into two parts by his mere thought. With these two shells he formed the heavens and the earth; and in the middle he placed the sky, the eight regions, and the eternal abode of the waters.'—See Dr J. Muir's *Original Sanscrit Texts*, vol. iv.

In later times at least, Brahma has had few special worshippers: the only spot where he is periodically adored being at Pushkara in Rajputana. He sometimes receives a kind of secondary homage along with other deities. Brahma is represented with four heads. See INDIA (section on *Religion*), TRIMURTI, VISHNU, SIVA.

Brahman, or **BRAHMIN**, the name of the highest Caste (q.v.) in the system of Hinduism. For Brahminism, see INDIA.

Brahmanbaria, a town of India, Tipperah district, in the presidency of Bengal, on the Titā River, 230 miles N.E. of Calcutta, with which it has communication by rail and river. There is a large trade in rice. Pop. 18,500.

Brahmaputra ('son of Brahmā'), one of the largest rivers of India, rises in Tibet, and, after partially mingling with the Ganges, flows into the Bay of Bengal. As a result of explorations (1878-82) by one of the Asiatics attached to the Indian Survey, the fact that the Sampo (see TIBET) is the highest source of the Brahmaputra was reduced to almost a certainty. The Sampo has its rise in Lake Manasowar in Western Tibet, in an elevated tableland, from which also spring the Sutlej and the Indus; flows eastward for about 1000 miles on the plateau of Tibet; then, turning S.E., it pierces the Himalayas to descend to the valleys of Assam, where it is known as Dihong, and unites with the Dibong and the Brahmakunda, the three rivers forming the Brahmaputra, which flows S.W. and S. The entire length from the latter source

exceeds 900 miles; from the former 1800 miles. The term Brahmaputra has been derived from the Hindu name of the river in Assam; by the Assamese it is known as Haraniya; above its junction with the Ganges it is known as the Jamuna. The united stream bears along a vast body of water (700,000 cubic feet per second on the average; 1,270,000 at high-water), broken by many islands, and throwing off branches; it flows from N.E. to S.S.W. for about 450 miles, leaves Assam near Dhoobri; flows S. round the Garo Hills; for 180 miles its course is through the plain of East Bengal, till it joins the Padma, or main stream of the Ganges, at Goalanda. Here the conjoint delta of these rivers begins; the great body of its waters (1,250,000 cubic feet per second on the average, and 2,435,000 at high-water) flowing S.E. reaches the sea by the estuary known as the Meghna. The old bed of the stream lay farther to the east, and still brings down a portion of its waters past the civil station of Maimansingh district, to join the main stream by means of the Meghna. During the rains the Brahmaputra floods hundreds of sq. m. of country, reaching a height of 30 to 40 feet above its usual level. This supersedes artificial irrigation, and the plains so watered yield abundantly in rice, jute, and mustard. It is navigable for steamers to Dibrugarh, 800 miles from the sea. The knowledge of the river by Europeans dates from 1765. The down-river traffic is largely composed of tea, also timber, oil-seeds, jute, tobacco, and rice; the imports include European cotton goods, liquor, tea-seed, &c.

Brahmin Ox. See ZEBU.

Brahmo Somaj (*Brahma Samāj*—i.e. 'Church of the one God,' 'Theistic Church') is a religious and social association in India, originated by the celebrated Hindu rajah, Rammohun Roy (q.v.), in 1830, under the title *Society of God*. The accession of Debendranath Tagore, a wealthy Calcutta Brahman, in 1842, gave the movement a great impetus, which was also much aided by the spread of English education. Its main development took place under Babu Keshub Chunder Sen, born in 1838, who died in 1884. He joined the new church in 1858, and visited Europe in 1870. It was his aim to apply the principles of the church to practical life, and under his leadership the progressive party seceded from the original church, and assumed the title of 'Bramo Somaj of India.' Their fundamental principles are that there is but one Supreme God, the object of worship; that nature and intuition are the sources whence our knowledge of God is derived; they reject all special revelation, and hold that religion admits of progressive development. They ignore all distinctions of caste, and consider all men as God's children; they abjure all idolatrous rites, and acknowledge no sacred books or places, but value what is good and true in all religions, and recognise the necessity of public worship. They have reformed the marriage customs and promoted female education. It is believed that the spirits of the saints and prophets may be invoked, or at least spiritually drawn into the life and character of the devotees. They have more than a hundred branches throughout India, and maintain two periodicals and several schools. Sen's co-religionists who disapproved of some of the tenets of the 'New Dispensation,' and of his conduct in marrying his daughter to a Hindu maharajah, seceded and formed in 1878 the Sadharan (or Universal) Brahmo Somaj, which rapidly rose to the foremost rank among the Theistic churches of India. The Arya-Somaj, founded by Dayānanda Sarasvati, who died in 1882, differs from the Brahmo Somaj in that, like all the ancient theologians of India, he looked upon the Vedas as

divine revelation. The most recent inventions of science were held to be alluded to in the Vedas; whatever was not found in them was false and useless. Amongst authorities see *Brahmo Dharma, or Religion of the Brahmos* (1850); *The Brahmo Somaj Vindicated* (1863), by Keshub Chunder Sen; *Brahmo Year Books* (1876, and following years); *Last Days in England of the Rajah Rammohun Roy* (1866), edited by Mary Carpenter; and her *Six Months in India* (1868); *Hours of Work and Play*, by F. P. Cobbe (1867); the English works of Rammohun Roy (1888); Mozoomdar's *Life and Teachings of Keshub Chunder Sen* (1888); and the *Theistic Quarterly Review*, which began to appear in Bengal in 1880 as organ of the Brahmo Somaj.

Brahms, JOHANNES, composer, was born in Hamburg, where his father was a musician in the theatre, on 7th May 1833, and early began the study of music. In 1853 his performance of some of his first sonatas so impressed Schumann that the latter, in an article in a musical publication, prophesied the coming greatness of the lad. Several years spent in study and retirement preceded the publication of a series of works that quickly established his reputation as a writer of chamber music. In 1863-64 he became conductor of the Singakademie in Vienna, where in 1869 he finally settled. The leading characteristics of his works (which exceed the 'opus' number 100) are an ascetic earnestness and a regard for pure musical form, causing him to pursue his main idea throughout a work, while steadfastly refraining from exalting expression at the expense of beauty. Of all the composers of the present day Brahms is held to approach most nearly to Beethoven, not only in individuality, vigour, and clearness, but in the ideal scope of his melodic inventions. These last vary greatly, some being slight and simple, but are always matured and full of expression. His subjects touch every department but the dramatic. Over fifty of his works are vocal; as a song-writer he had latterly no living equal in Germany, and after his *Deutsches Requiem* (1868), his successive compositions were musical events. His technical execution as a piano-player was remarkable. He died 2d April 1897. See his *Life* by Deiters (Leip. 1881; Eng. trans. 1887), and *Recollections* by Dietrich and Widmann (Eng. trans. 1899).

Brahui. See BELUCHISTAN.

Braid, JAMES, born in 1795 in Fife, studied medicine at Edinburgh, and settled as a surgeon in Manchester, where he died, 25th March 1850. He is noted for his researches on Animal Magnetism (q.v.), which he called Hypnotism.

Braidwood, THOMAS, born in 1715, studied at Edinburgh University. He settled as a school-master there, and after 1760 became famous as a teacher of the Deaf and Dumb (q.v.). His school, which was visited by Dr Johnson, was afterwards transferred to Hackney, London, where Braidwood died, 24th September 1798.

Braila, or BRAILOV, a river port of Rumania, on the left bank of the Danube, 10 miles above Galatz, and 142 N.E. of Bucharest by rail. A free port till 1883, it exports large quantities of corn and other products. Of its twelve churches the chief is the Greek cathedral. The fortifications were dismantled in 1828. Pop. 46,716. Braila was burned by the Russians in 1711, and Gortschakoff crossed here in 1854.

Braille, LOUIS. See BLIND.

Brain is the term applied to that part of the central nervous system which in vertebrate animals is contained within the cranium or skull, and, in the invertebrate, to the nervous ganglia near

the head end of the body. The brain is enveloped by three membranes, named the *Dura-mater*, the

Fig. 1.—Cerebrum—upper surface (Quain):

Arachnoid, and the *Pia-mater*. These support the blood-vessels which nourish the cranium and

Fig. 2.—Under Surface, or Base of Brain:

F.L., T.L., O.L., frontal, temporal, and occipital lobes of the cerebrum; *cb, cb* cerebellum, the medulla oblongata lying between its two lobes. *Cranial Nerves*.—1, olfactory lobe (the nerve of smell); 2, optic nerve (nerve of sight); 3, third or oculo-motor nerve, motor nerve to most of the muscles of the eye; 4, fourth or trochlear nerve, motor nerve to the superior oblique muscle of the eye; 5, fifth, trigeminus, or trifacial, sensory and motor, the large root sensory to the face and eyes, &c.; the small root, motor to muscles of mastication; 6, sixth or abducent nerve, to external rectus muscle of eye, turns eyeball outwards; 7, seventh or facial, motor to muscles of expression; 8, eighth or auditory nerve, sensory for hearing (cochlea) and for equilibration (semicircular canals); 9, glossopharyngeal, sensory nerve of taste, and motor to some of the muscles of deglutition; 10, pneumogastric, sensory and motor to larynx, lung, heart, and stomach; 11, spinal accessory, motor to muscles of heart (inhibitory) and sterno-mastoid and trapezius; 12, hypoglossal, motor to all the muscles of the tongue; *c₁*, first cervical spinal nerve.

the brain, and also contain a clear fluid—the cerebro-spinal fluid—which removes the products of

brain waste, and at the same time serves, like a water-cushion, to diminish the effect of external shocks. Brain substance is composed of *gray* and *white matter* (with some connective tissue and blood-vessels). The gray matter consists of *nerve cells*, which are minute structures, variously shaped, communicating by numerous fine processes with *nerve fibres*. These cells discharge nerve impulses to, and receive impressions from nerve fibres. The white matter is composed nearly entirely of white medullated nerve fibres, whose function is to transmit nerve impulses from one point to another. The relations of the gray and white matter vary greatly in the different parts of the brain. The main divisions of the brain are the *cerebrum* (great brain or cerebral hemispheres), the *cerebellum* (with the *pons Varolii*), the *optic lobes* (*corpora quadrigemina*, with the *crura cerebri*), and the *medulla oblongata*. An examination of figs. 1, 2, 3, 5, from different aspects of the human brain, will convey an idea of the relative size and position of these parts. The cerebrum underlies the whole vault of the cranium, and covers all the rest of the brain when seen from above (fig. 1). Below its posterior extremity, and separated from it by a fold of dura-mater, is the cerebellum. Below the cerebellum, again, lies the medulla oblongata, which is continuous, through an opening in the base of the skull called the foramen magnum, with the

fissure, at the bottom of which lies a great transverse commissure, the *corpus callosum*. The hemispheres are covered with a thin layer of gray matter (or nerve cells), and thrown into ridges and furrows (technically called convolutions or gyri, and fissures). These seem (fig. 1) to be arranged without any definite order, but Gratiolet, by comparing the simpler brains of monkeys and of the human embryo, discovered that certain fissures ('primary' fissures) were

Fig. 4.—Lateral (A) and median (B) surface of the Brain of the Human Embryo, to show the simple Convolutions and the primary Fissures (Mihalkovics):

fs, fissure of Sylvius; *fr*, fissure of Rolando; *poc*, parieto-occipital fissure; *olf*, olfactory lobe; *f*, fornix; *pc*, pons Varolii; *mo*, medulla oblongata; *cb*, cerebellum.

Fig. 3.—Median Longitudinal Section through Head and upper part of Neck, to show relation of Brain to Cranium and the Spinal Cord (Original drawing from preparation in Anatomy Rooms at Surgeons' Hall, Edinburgh):

c, cerebrum; *cb*, cerebellum; *sc*, spinal cord; *spc*, spinal column; *mo*, medulla oblongata passing, through foramen magnum, into the spinal cord; *pv*, pons Varolii; *cp*, cerebral peduncles, or *crura cerebri*; *cpq*, anterior corpora quadrigemina; *cpq*, posterior corpora quadrigemina; *pg*, pineal gland; *pb*, pituitary body; *cc*, corpus callosum, divided transversely; *f*, fornix; *mg*, marginal gyrus; *gf*, gyrus fornicatus; *cmg*, callosal-marginal sulcus; *ol*, occipital lobe; *po*, parieto-occipital fissure; *cf*, calcarine fissure; *dm*, dura-mater, separating cerebrum from cerebellum. The lines AB and CD show the position of the sections in figs. 6 and 7 respectively.

Spinal Cord (q.v.). The medulla passes directly upwards into the protuberance called the pons Varolii, which is connected by the *crura cerebri* or cerebral peduncles with the cerebrum. Behind the *crura cerebri*, in the angle between the cerebrum and cerebellum, lie the optic lobes (*corpora quadrigemina*). The cerebrum consists of two nearly equal *hemispheres*, divided by a deep median

always present. There are, on the outer surface, the *fissure of Sylvius* (*fs*), the *fissure of Rolando* (*fr*), and, on the inner surface, the *parieto-occipital* (*po*). These fissures form the boundaries of the various lobes of the cerebrum. (1) The *frontal lobe* (*FL*) is that part of the outer surface, and the corresponding part of the median surface, which lies anterior to the fissure of Rolando. (2) The *temporo-sphenoidal lobe* (*TL*) lies below the fissure of Sylvius. (3) The *occipital lobe* lies behind the parieto-occipital fissure, and includes the corresponding parts on the outer surface. (4) The *parietal lobe* is bounded by the fissures of Rolando and of Sylvius, and by the occipital lobe. (5) The *island of Reil* lies at the bottom of the fissure of Sylvius (*ir*, fig. 4), and is obscured in the adult by the adjacent lobes. Secondary fissures on these lobes divide them into *convolutions*. Thus (fig. 5), on the frontal lobe, we have the first (*F₁*), second (*F₂*), third (*F₃*), and ascending (*af*) frontal convolutions; on the temporo-sphenoidal, the first (*T₁*), second (*T₂*), and third (*T₃*) temporal convolutions; on the parietal, the ascending (*ap*), postero-parietal (*pp*), angular (*13'*), and supra-marginal (*13*) convolutions. On the median surface (fig. 3) we have the *marginal* convolution, the *gyrus fornicatus* (*gf*), immediately above the corpus callosum, and the *gyrus hippocampi*, &c. On the under surface of the cerebrum we see the two olfactory nerves (1) and the two optic nerves (2). The latter, crossing like the letter X, wind round the two cerebral peduncles (*cp*), to terminate in the optic thalami and optic lobes. These peduncles are seen passing from the under surface of the hemispheres, and approaching each other as they enter the pons Varolii. If we press apart the two cerebral hemispheres, we come upon the corpus callosum (*cc*, fig. 3). This is a band of white fibres that probably connects corresponding convolutions of both hemispheres. On dividing this and removing some white fibres (the fornix, fig. 3, *f*), and a layer of connective tissue (*velum interpositum*), with its vascular margin (the choroid plexus), we expose the *ventricles* of the cerebrum—viz. the two lateral and the third ventricles. The former occupy the hemispheres, the latter lies between them, and is continued backwards through a narrow channel (the *aqueduct of Sylvius*) into the fourth ventricle,

which lies behind the pons Varolii and medulla (figs. 6, 7, 8). Projecting into the third and lateral ventricles are rounded masses of gray matter, the *corpus striatum* and *optic thalamus*, often called the *basal ganglia* (figs. 6, 7). A better idea of the

Fig. 5.—Outer aspect of Brain, showing relation to the bones of the Skull, and the position of Ferrier's areas (Landois):

fr, fissure of Rolando; *fs*, fissure of Sylvius; *po*, parieto-occipital fissure; *F1* superior, *F2* middle, *F3* inferior frontal; *af*, ascending frontal convolution; *ap*, ascending parietal; *pp*, postero-parietal convolution; *T1* superior, *T2* middle, *T3* inferior temporo-sphenoidal convolution; *O*, occipital lobe; *cb*, cerebellum; 1 (postero-parietal convolution), advance of the opposite leg, as in walking; 2, 3, 4 (round upper extremity of fissure of Rolando), complex movements of opposite leg, arm, and of the trunk, as in swimming; *a*, *b*, *c*, *d* (ascending parietal convolution), individual and combined movements of the fingers and wrist of the opposite hand, or prehensile movements; 5 (posterior end of superior frontal convolution), forward extension of opposite arm and hand; 6 (upper part of ascending frontal convolution), supination and flexion of opposite forearm; 7 (median part of ascending frontal convolution), retraction and elevation of opposite angle of the mouth; 8 (lower part of ascending frontal convolution), elevation of ala nasi, and upper lip, with depression of lower lip; 9 and 10, opening of mouth with protrusion and retraction of tongue—on the left side is aphasic region; 11, between 10 and lower end of ascending parietal convolution, retraction of opposite angle of the mouth, the head turns slightly to one side; 12, posterior part of the superior and middle frontal convolutions (eyes open widely, pupils dilate, head and eyes turn towards opposite side); 13, 13' (supra-marginal and angular gyrus), eyes move towards opposite side, or upwards and downwards (centre for vision); 14, superior temporo-sphenoidal convolution (centre for hearing).

relation of all these parts will be gained by studying the two transverse sections (figs. 6 and 7) made in the direction of the dotted lines AB and CD in fig. 3. Surrounding the whole cerebrum is the thin convoluted envelope of gray matter, about a quarter inch thick. Within this lies the *centrum ovale* composed of white fibres. Connecting the two hemispheres is the corpus callosum (*cc*) with, underneath it, the *septa lucida* and *fornix* (fig. 7). Projecting into the ventricles are the ovoid optic thalamus and the caudate nucleus (*cn*) of the *corpus striatum*. A wedge-shaped mass of gray matter (*ln*), the *lenticular nucleus* of the corpus striatum, is separated from the first two nuclei by a band of white fibres, the *internal capsule* (*ica*), which in fig. 6 we see to be composed of two parts, an anterior limb and a posterior limb, which meet each other at an obtuse angle (the knee). Immediately outside the lenticular nucleus is the white *external capsule* (*ec*), separated by a thin band of gray matter, the claustrum, from the island of Reil (*ir*). The centrum ovale consists of nerve fibres passing in various directions, very difficult to unravel from each other. Certain of

them pass between adjacent convolutions, others again connect parts at a distance, such as the frontal and occipital lobes, many cross by the corpus callosum to end probably in corresponding convolutions of the opposite hemisphere. Others connect the basal ganglia with the cortical gray matter. From the internal capsule an important group, known as the *corona radiata* (see fig. 7), passes to the whole of the cortex. That part of the corona radiata entering the occipital lobes is called the optic radiation of Gratiolet, who considered it to be the central expansion of the optic nerve (*or*, fig. 6).

The *optic lobes* consist of two (anterior and posterior) pairs of rounded eminences of gray matter (figs. 3 and 8) situated close to the optic thalami, and underlying the pineal gland. They are very intimately connected with the optic nerves, part of these ending in the anterior pair; and also to the third and fourth nerves, whose nuclei of origin lie just underneath them in front of the aqueduct of Sylvius (3', fig. 8). The *curia cerebri* are formed of fibres passing down from the cerebrum to the pons, medulla, and cord (see fig. 3), and of others passing up from the medulla and cord, and from the cerebellum (superior peduncles) to the cerebrum.

The *cerebellum* possesses a median and two lateral hemispheres which have been subdivided into lobes (figs. 2 and 3). Its parts are arranged in thin laminae or folia with deep intervening fissures.

Fig. 6.—Transverse Section of Cerebrum in plane of line CD (fig. 3) (Original drawing):

F.L., frontal; T.L., temporal; O.L., occipital lobes; *fs*, fissure of Sylvius; *ir*, island of Reil; *cn*, caudate nucleus; *ln1*, *ln2*, *ln3*, the three divisions of the lenticular nucleus; *ica*, anterior limb of internal capsule; *icp*, posterior limb of internal capsule (the anterior part conveys motor, the posterior sensory fibres), the part generally injured in cerebral hemorrhage; *ot*, optic thalamus; *or*, optic radiation, probably conveys sensory fibres to occipital and temporal lobes; *ac*, anterior commissure, connects both temporal lobes; *f*, fornix; *pc*, posterior commissure; *pg*, pineal gland; *lv*, lateral ventricle (posterior horn).

These laminae have a central core of white matter with a thin covering of gray matter. Sections through them recall the appearance of a tree and its branches (hence the term *arbor vitae*). The cerebellum has three pairs of *peduncles* (fig. 8)—(*a*) superior, which pass upwards and across the middle line towards the opposite cerebral hemisphere, but ending under the optic lobes; (*b*) middle, which form the main part of the pons Varolii, and which enter indirectly into connection with fibres from

the opposite cerebral hemisphere; (c) inferior (the *restiform body*), which is connected with the medulla and Spinal Cord (q.v.). There is also an intimate connection by the auditory nerve with the semicircular canals of the ear.

Fig. 7.—Vertical transverse Section of Brain in direction of line AB (fig. 3) (Original drawing):

The shaded outline of the cerebrum indicates the superficial gray matter.

fs, fissure of Sylvius; *ir*, island of Reil, a convolution at the bottom of the fissure of Sylvius concealed in the adult; *cc*, corpus callosum, the transverse interhemispherical commissure; *lv*, lateral ventricle; *f*, fornix, divided transversely. Between the fornix and the corpus callosum are seen the thin septa lucida; *ca*, caudate nucleus; *ln*, lenticular nucleus (with its three divisions); *ic*, optic thalamus; *ec*, internal capsule; *ec*, external capsule, and outside it a layer of gray matter, the claustrum; *p*, pons Varolii; *mo*, medulla oblongata; *oi*, inferior olivary body; *cb*, cerebellum; *l*, *a*, *f*, *s* mark the origin of the dotted lines representing motor fibres passing from the leg, arm, face, and speech 'centres,' through the internal capsule, cerebral peduncles, pons Varolii, medulla oblongata, and crossing at *dp*, the decussation of the pyramids to the opposite side of the spinal cord (to explain crossed paralysis). Another dotted line passes from *s* (speech centre) to hearing centre in first temporal convolution.

The *Medulla Oblongata* is the lowest division of the brain. It has a somewhat conical form, with the base towards the pons Varolii, the narrow end towards the spinal cord. On the under surface, on each side of the middle line, are the *anterior pyramids* decussating with (crossing) each other where the medulla passes into the spinal cord. External to them is an ovoid projection, the *olivary body* (fig. 2). On the dorsal aspect is the lozenge-shaped fourth ventricle, which is bounded below by the two inferior and above by the superior peduncles of the cerebellum. All the cranial nerves below the fourth originate from the floor of the medulla in the positions marked by the numbers on the right side of fig. 8. Their points of emergence on the under surface are indicated in fig. 2.

SIZE OF BRAIN.—The brain of the male has an average weight of 49½ ounces, that of the female is about 5 ounces lighter. Cuvier's brain weighed 1861 grammes (1 gramme is 15½ grains), Turgeineff's 2012 grammes. On the other hand, Virchow has found a brain weighing 1911 grammes in a man without any specially high mental development, and the brains of some very able men have been found below the average weight. Too much stress has been laid upon the connection of mental capacity with brain weight in individual instances. Still the general fact is that the most highly developed races have the heaviest brains.

FUNCTIONS OF THE CEREBRUM.—If we remove the cerebral lobes from an animal, we deprive it of

its volition and its intelligence. We may leave it capable of performing very complex movements, almost, if not quite, as perfectly as before; but we have destroyed its power to initiate these movements, we reduce it to the condition of a responsive machine. Thus a frog without its cerebrum will, if undisturbed, remain motionless for an indefinite time. If it be placed on a board, and the board tilted, it will change its position till its equilibrium is stable, and then it becomes motionless. If put into water, it will swim, and if a piece of wood be put before it, it will climb up on it, and there remain; if it be pinched, it will spring and will avoid any obstacle placed in its way, just as an entire frog would. A pigeon similarly treated becomes drowsy and stupid. If food be placed before it, it will not take it; it exhibits no sign of terror at what would otherwise cause it alarm, further than to start slightly at a loud sound, or a bright light. But if thrown into the air, it will fly to a convenient resting-place; if placed on its back, it will regain its feet, and thereafter become drowsy again.

Fig. 8.—Medulla Oblongata with Corpora Quadrigemina seen from behind (Cerebellum cut away) (Landois):

ot, optic thalamus; *pg*, pineal gland; *cqa*, anterior corpora quadrigemina; *cpq*, posterior corpora quadrigemina; *sp*, superior cerebellar peduncle; *mp*, middle cerebellar peduncle, goes to pons Varolii; *ip*, inferior peduncle, or restiform body, goes to medulla oblongata and spinal cord; *fg*, funiculus gracilis, or column of Goll; *nfg*, nucleus of the funiculus gracilis; *fc*, funiculus cuneatus, or column of Burdach; *nfc*, nucleus of the funiculus cuneatus. The lozenge-shaped area in the centre of the figure is the fourth ventricle. The numbers 4-12 indicate the superficial roots of the corresponding cranial nerves. The numbers 3'-12', their nuclei of origin.

Similar experiments on other animals show similar results. In man we find that imperfect development of the cerebrum is accompanied by imbecility and idiocy, and that the races that have the heaviest cerebra and the most fully developed convolutions are the most intelligent. Among animals, again, the degree of intelligence increases with the increase in size of the cerebrum relatively to the other parts of the brain.

Flourens, the great French physiologist, held that the *whole* of the cerebrum was employed in *every* mental process. He removed parts of the hemispheres of pigeons, and came to the conclusion that *all* the mental functions became enfeebled, and that to an equal degree, in proportion to the amount of brain matter removed, no matter from what part of the cerebrum it were; and that as long as any part of the gray matter remained, so

long could mental functions be carried on. This doctrine long held the field. It seemed to explain why large masses of brain substance could be removed by injury without apparent effect on the mind, and why there was no constant relation between symptoms and locality of brain lesions. But it did not explain all the facts. The condition of *Aphasia* (q.v.), or loss of articulate speech, was found to be almost constantly associated with a certain convulsion, and certain paralysis and limited convulsive phenomena were found by Hughlings Jackson to be apparently due to definitely localised lesions. In 1870 Fritsch and Hitzig, two German observers, discovered that when certain areas of the cerebral cortex were stimulated by the galvanic current, movements of the opposite side of the body were produced. This discovery put the question of cerebral localisation on a new footing. Ferrier repeated and extended their results, and soon succeeded in mapping on the brains of animals (rabbits, dogs, and monkeys), areas, stimulation of which by the faradic current produced movements which corresponded to the area as accurately as the notes correspond to the keys of a pianoforte. A great controversy immediately arose as to the meaning and value of these discoveries, the result of which has been to substantiate their accuracy, and to lead to their extension. Ferrier's 'motor areas' (see fig. 5) lie on either side of the fissure of Rolando, and extend into the postero-parietal and part of the first, second, and third frontal convolutions. The lower part of the area corresponds to the movements of the face and tongue; the intermediate parts to those of the arm; the upper to those of the leg. Recently, a centre for the muscles of the trunk, arm, and leg has been found on the marginal convolution (on the median aspect of the parietal lobe); and Ferrier's areas have been further subdivided, so that centres for such fine movements as, e.g., the apposition of the forefinger to the thumb have been mapped out on the brain of the monkey by Horsley, Schäfer, and others. A knowledge of the correspondence between the convolutions of the simian and the human brain, and of the relation of the convolutions of the latter to the bones of the skull (see fig. 5), has already led to the successful removal of tumours whose seat was indicated by definite motor disturbances. When these areas are destroyed by disease, the power of the corresponding voluntary movement or movements is lost. When they are irritated, corresponding spasms of movement are set up (Jacksonian epilepsy).

Aphasia.—The left hemisphere controls the right side of the body, and as we are mostly *right-handed*, so we are *left-brained*. When the posterior end of the third frontal convolution on the left side is destroyed, *aphasia* results. An aphasic person understands what is said to him, but has lost the power of articulate speech—the words wanted are either forgotten or cannot be uttered, and this although the muscles of articulation are unimpaired. They cannot be co-ordinated. In *left-handed* individuals aphasia has been found associated with the corresponding lesion on the right side of the cerebrum. The third left frontal convolution is said to be well developed in the brains of remarkable men, and to be very simple in deaf-mutes, and quite rudimentary in idiots. The corresponding condition of *agraphia*, or inability to express one's self intelligently by writing, has been recently found associated with lesions of the posterior end of the second frontal convolution.

From these various areas white nerve fibres pass downwards through the centrum ovale, and converge toward the internal capsule, where they occupy the anterior two-thirds of the posterior limb,

the fibres from the face and tongue being farthest forward, then come those for the arm, and lastly those for the leg. The fibres that go to the nuclei of the facial and tongue muscles, cross the middle line a little below this, those for the limbs and arm at the decussation of the pyramids at the lower end of the medulla. When a cerebral hemorrhage injures them in the internal capsule (the most frequent seat), crossed paralysis will follow, with aphasia if the lesion has been on the left side (fig. 7, *l, f, a, s*).

Cortical Sensory Areas.—The determination of the existence of definite areas for the conscious perception of the different forms of sensory impressions is much more difficult than that of the motor areas, and physiologists are yet far from being agreed on this point.

Centre for Sight.—Munk places this centre in the occipital lobe; destruction of one lobe produces permanent blindness in one side of both eyes (what is called homonymous hemianopsia). Ferrier destroyed the occipital lobes in monkeys, and found no appreciable alteration of vision, but when in addition both angular gyri were destroyed, permanent blindness followed. Destruction of one angular gyrus caused only temporary loss of vision in the opposite eye, while destruction of both caused a similar temporary condition in both eyes. In man, disease of the *left* angular gyrus produces what is called *word-blindness*. In this condition one loses the power of reading words, although one sees the characters distinctly, and may even be able to spell the word. One may even retain the power of writing spontaneously or from dictation, and yet be unable to read what has been written. It may be compared to the condition where one has completely forgotten a foreign language; one can write or read the words, but has absolutely lost their meaning. Recent investigation seems to show that the occipital lobes alone are the centre for sight, each lobe being connected with the corresponding lateral halves of the two eyes.

Centre of Hearing.—This seems to lie in the first temporo-sphenoidal convolution in both sides. In man, partial destruction of this convolution on the left side causes the condition of *word-deafness* (where one hears the sounds, but has absolutely lost their meaning).

Centre for Taste and Smell.—Ferrier locates the former of these in the uncinate gyrus (on the inner surface of the temporo-sphenoidal lobe).

Centre for Touch (common sensibility).—Many physiologists place these in the motor area. Ferrier, Horsley, and Schäfer find that they are in the gyrus fornicatus and the gyrus hippocampi (on the median aspect of the brain, above and behind and below the corpus callosum, fig. 1).

Fibres from the various sense organs lead to the cortical areas, through the posterior third of the internal capsule. If this is injured, loss of all forms of sensibility—hearing, sight, taste, touch, &c.—of the opposite side follows.

Frontal Lobes.—No definite result follows from the experiments made on the anterior part of the frontal lobes; but it is probable that they are associated with the exercise of the higher mental faculties. They are well developed in highly intelligent individuals, and *vice versa*. It must be admitted, however, that cases have been recorded (as in the American case of a man injured in this region by a crowbar) where the frontal lobes have been greatly damaged without apparent effect on the mind. (It is usual to speak of the cerebrum as being the *seat* of the various mental faculties, and of the *will* as producing voluntary movement. All we know is this—that changes in consciousness are *accompanied* by molecular changes

in the brain; the one does not *produce* the other. So it is nervous activity that produces movement; not the mental action of the *will*.)

Basal Ganglia.—Stimulation of the corpus striatum causes general contraction of the muscles on the opposite side of the body, as if the whole motor area were being stimulated at once. Destruction of the optic thalamus seems to cause interference with the vision (the optic tract ends partly in its posterior part), and sometimes with other forms of sensation. Further investigation, however, is needed to establish definitely the functions of these ganglia.

Optic Lobes.—The optic lobes seem to be concerned in the co-ordination of those movements noted in the frog as persisting after removal of the cerebral hemispheres. A frog without these lobes loses the power of recovery from a disturbance of its equilibrium, or of properly performing any other set of combined movements. In man the anterior pair of the corpora quadrigemina seems to control the reflex contraction of the pupils, and of some of the movements of the eyes through the third nerve; while the posterior pair has some more general co-ordinating power. Unilateral lesions cause in animals what are called 'forced movements'—i.e. a tendency to run in a circle, like a horse in a circus, or to turn like the hand of a watch round the tip of the tail as a centre, or to rotate round the axis of the body.

Cerebellum. Flourens considered that the function of the cerebellum was to co-ordinate voluntary movements. He found that removal of superficial layers in a pigeon caused slight weakness and disharmony of movement; that further removal caused general agitation, and finally loss of ability to stand or fly or walk. It could not rise when placed on its back. But it was not paralysed, it made continual ineffectual struggles to recover its position, and only ceased when completely exhausted. There was no loss of volition or intelligence. It could see and hear and feel quite well. Disease of the human cerebellum, however, when it causes symptoms, does not cause *general* inco-ordination, but merely a staggering gait like that of intoxication, and a feeling of giddiness. Ferrier holds that it is the centre for co-ordinating movements necessary for the equilibrium of the body, and that its different parts control different sets of these movements. For instance, destruction of the anterior part of the median lobe causes tendency to fall forwards, loss of its posterior part causes tendency to fall backwards, and of one lateral lobe a tendency to rotate towards the side injured. Stimulation of any one of these parts causes movements of the head, eyes, and limbs, such as would counteract the disturbance of equilibrium produced by the destruction of the part. The anatomical connections of the cerebellum, with the semicircular canals of the ear, seem to point to the same conclusion. Other observers have regarded the cerebellum as the seat of the muscular sense, or for the maintenance of muscular tone, but without sufficient warrant.

The *Medulla Oblongata* is the great seat of the centres for the functions of organic life, as may be understood from the fact that it gives origin to all the cranial nerves, except the first four pairs (see fig. 8). The various centres are: (1) The centre for respiratory movements, near the lower extremity of the fourth ventricle; (2) for the inhibition (or restraint), and for the acceleration of the movements of the heart; (3) for the control of the blood pressure (vaso-motor centre), including the 'diabetic' centre, which is simply the vaso-motor centre for the liver; (4) centre for swallowing; (5) centre for movements of the gullet and stomach, and the vomiting centre; (6) for movements of

articulate speech; (7) for the secretion of the saliva. The term 'centre' involves the following mechanism: (1) A sensitive end-organ or surface; (2) an afferent nerve going to (3) a nerve cell, or group of nerve cells, from which passes (4) an efferent nerve fibre to (5) a muscle. That the action of the 'centre' be possible all the links in the chain must be intact.

DISEASES OF THE BRAIN.—**Abscess.**—Abscess of the brain is a collection of pus in its substance. The most common causes are compound fractures of the skull, diseases of the middle ear and temporal bone, and pyæmia. Many cases develop quietly, others are preceded by headache, pain, vomiting, delirium. When pus has formed, the symptoms will depend on the site; usually there is more or less paralysis of motion. Finally the signs of compression precede the fatal termination. When an abscess in the brain has formed, if its situation can be made out, the pus should be evacuated by Trephining (q.v.). Many cases have recently been treated successfully in this way.

Anæmia of the brain is a deficiency in the quality or in the quantity of blood in the brain. It may result from direct loss of blood, exhausting diseases, weakness of the heart, or from the pressure of growths or fluids within the skull. Headache, drowsiness, hyperæsthesia, giddiness, muscular weakness are generally present, and most marked in the erect position. Syncope, or fainting, may result from the too rapid assumption of the erect position. In anæmia from acute loss of blood, and in syncope, the head must be kept low, and stimulants applied to the skin, and, if possible, administered internally. In chronic anæmia, the cause must be removed, stimulating nourishment given at frequent intervals, and iron administered.

Atrophy of the brain is a wasting of its substance, and is either congenital, or a condition accompanying old age, or resulting from exhausting disease, and very frequently from alcoholic excesses. The congenital form produces imbecility or idiocy. The acquired form leads to loss of memory and of mental power, and generally to diminution of muscular power.

Compression, concussion, and contusion of the brain are three terms often popularly confounded with each other. Compression means the squeezing of the brain by any fluid such as blood, serum, or inflammatory exudation or tumour. Concussion is the result of shock to the brain from an injury, but without visible effect on its substance. In contusion the brain substance is more or less lacerated. In compression there is paralysis, insensibility, coma gradually deepening, dilated pupils, and generally a slow pulse. In concussion there is first a period of collapse, with pallor of face, feebleness of pulse, and cold extremities. If this is recovered from, consciousness gradually returns with vomiting, fever, and a more or less sleepy condition. Perfect quiet, and the avoidance of all stimulation, must be observed till convalescence is complete.

Congestion of the brain causes headache, giddiness, mental excitement, and sleeplessness. If long continued, a period of depression follows with drowsiness, mental and physical weakness. Some attacks are so acute as to produce delirium, or convulsions, or even symptoms of apoplexy, which may be fatal. Among the causes of acute congestion may be noted excessive mental strain, the use of alcohol in excess, and some of the acute fevers. It is of frequent occurrence in certain diseases of the nervous system.

Inflammation of the brain substance is usually the result of injury or disease of the bones of the skull, and is accompanied with more or less meningitis.

Hæmorrhage into the brain leads to Apoplexy

(q.v.). It is probably always preceded by disease of the blood-vessels, more especially with chronic Bright's disease and alcoholism. The vessels which rupture are most commonly the small arteries which pass through the basal ganglia. The onset may be quite sudden, or there may be premonitory symptoms such as headache, giddiness, or numbness in the limbs, &c.

Meningitis, Hydrocephalus (or water in the head), *Epilepsy, Aphasia*, are all forms of brain disease, but are treated as separate articles.

Brain Fever is a popular term which includes congestion of the brain and its membranes, delirium tremens, and inflammation of the brain substance itself. It ought to be discontinued altogether.

Softening is a term popularly and very erroneously used to indicate failure of mental power and general feebleness, often accompanied with drowsiness, dullness, loss of memory, and with emotional excitability. There may be no actual softening in such a condition—merely atrophy of the brain.

True softening is the result either of clotting of blood in the vessels, disease of the walls of the arteries (atheroma), or Embolism (q.v.), or the presence of tumours. The brain substance becomes red, or yellow, or white, and the fibres break up as oil drops, and are gradually absorbed, a cyst containing fluid being left. The symptoms will depend on the part affected; if in the motor area, there will be paralysis of motion; or in the sensory area, loss of the corresponding power of conscious perception.

Tumours may grow from the membranes, the blood-vessels, or the connective tissue of the brain. They vary greatly in structure, many being allied to the sarcomata. The symptoms vary greatly according to their position, or may be absent entirely. The most common symptoms are intolerable headache, vomiting (without sickness), giddiness, convulsions, paralysis, and a condition of the optic nerve and retina recognisable by the ophthalmoscope, called optic neuritis. Some tumours can be removed by medical treatment, a few by surgical means. Generally all that can be done is to relieve pain and support the strength.

Brain-coral, or BRAINSTONE CORAL, a popular name for massive corals belonging to the family *Astræide*. The windings of their limy framework and their common rounded form have suggested that general resemblance to the convoluted brains of higher animals which the name implies. The name is especially applicable to the genus *Maandrina* (*M. cerebriformis, sinuosissima*, &c.), where the individual animals which compose the colony are arranged in long winding rows. Those of one row are not separated from one another by the usual round walls, and thus elongated continuous furrows are formed not unlike brain convolutions. The entire shape is roughly hemispherical; the rate of growth slow; the total size often large. They are abundant in the West Indian Ocean. About twenty species of *Maandrina* are known, some living, others occurring from the chalk on to tertiary strata. See CORAL, MADREPORE.

Braine-le-Comte, a busy town of the Belgian province of Hainaut, on the Senne, 19 miles SSW. of Brussels. It has an old church of the 13th cen-

tury, cotton and corn mills, dye-works, breweries, &c. Some of the finest flax that can be produced is grown in the district. Pop. (1884) 8176.

Brainerd, DAVID, missionary to the American Indians, was born at Haddam, Connecticut, 20th April 1718. He entered Yale College in 1739, but three years later was expelled for declaring that one of the college tutors had no more of the grace of God than a chair. That same year he was licensed to preach, and sent as a missionary to the Indians in Massachusetts. He laboured afterwards among the Indians in Pennsylvania, and with much success in New Jersey, baptising there no fewer than seventy-seven converts, of whom thirty-eight were adults. In 1747 he died in the house of Jonathan Edwards, by whose able pen his *Life* was soon after written. The year before his death Brainerd published the narrative of his labours in his *Mirabilia Dei inter Indicos and Grace Displayed*. These were republished, together with the *Life*, in 1822, and had some popularity. See Sherwood's essay, introductory to the third edition (New York, 1884).

Braintree, a market-town of Essex, 45 miles NE. of London by rail. It has manufactures of silk, crape, and straw-plait, with malt-kilns, corn-mills, breweries, and an iron-foundry. The ancient church of St Michael (1350) was restored in 1864-66; there are also a corn exchange and mechanics' institute. Pop. of parish 5303.

Brake. See BRACKEN.

Brakelonde. See JOCELIN.

Brakes. Any contrivance for controlling by friction the speed of carriages, wagons, trains, or revolving drums is called a brake. In its simplest form, as applied to road vehicles, wooden blocks are pressed by the driver through the medium of connecting-rods or levers against the tires of the wheels; the friction thus set up checks the speed, enabling the vehicle to go steadily down inclines, or to be rapidly pulled up.

Brakes, however, find their most important application on trains. Soon after the introduction of railways, improvements in the locomotive compelled engineers to devise means for controlling its speed. Stephenson arranged a brake, in which steam admitted into a small cylinder, pushed out its piston, and so through the action of levers pressed the blocks against the tires. It was a failure partly because it was applied only to wheels on one side of the engine, thus tending to cause it to leave the rails. Since then much labour has been spent on this question, chiefly with the object of making brakes continuous and automatic. The conditions a train-brake must fulfil are these: It must be continuous, automatic—i.e. in case of accident, such as the breaking apart of the train, it must instantaneously put itself on—be equally readily put on or off any vehicle, and be simple in construction and durable. Moreover, it should allow of vehicles being slipped or detached without putting it on, should be tell-tale to indicate if it is in working order, be constantly in use, and lastly, very powerful, capable of stopping a heavy train at a high speed in a few hundred yards.

The chief types now used are chain, vacuum, and pressure brakes; but the first great advance was in the application of the screw to regulate the pressure of the brake-blocks on the tires, a plan still used in hand-brakes, where compressed springs give great power; the blocks are now cast-iron. The chain-brake is simply a continuous chain extending under several vehicles, wound up by a drum on the brake-van so as to be in tension; this keeps the blocks off; but if the guard slacks the chain, or it breaks through the train parting, compressed springs come into play, forcing the blocks

against the tires; it is thus partly automatic, and has been much used. Vacuum-brakes work on the principle of keeping up a vacuum in a continuous pipe or pipes extending under the train, and in brake-cylinders connected to them under each vehicle, the air being sucked out by ejectors or pumps on the locomotive. Each cylinder has a piston working in it which is, with a vacuum on both sides, in such a position that the blocks are off; but if air is let into pipes the vacuum on one side is destroyed and the piston moves over, putting on the brakes by the help of suitable levers. In other forms the cylinder is a flexible sack which is collapsed by the atmosphere, and puts on the brakes directly a vacuum in the pipes is produced.

The best known pressure-brake is the invention of Mr Westinghouse of Pittsburgh, U.S.A., whose first brakes were non-automatic, but were superseded by his automatic brake. In the latter, compressed air, at from 80 to 100 lb. per square inch, is stored in a reservoir under each vehicle and in a pipe connecting them, also under each vehicle is a brake-cylinder with pistons, the rods of which operate the brake-levers, and lastly, a connecting valve called a 'triple valve.' As long as pressure is maintained in the pipe the brake is off; but if air escapes intentionally or otherwise from the pipe, the brakes are put on. The triple valve is an ingenious piece of mechanism. A piston with a sliding valve attached to its top works in a small case, with connections to the pipe, cylinder, and reservoir. If there is pressure in the pipe it acts on the under side of piston, keeping it with its valve in such a position that the brake-cylinder is in communication with the air (and so the brakes are off), while compressed air can feed to the reservoir; but if the pressure in the pipe falls, the excess pressure in the reservoir acts on the top of the piston, forces it and the valve down, shuts passage to the air, and allows compressed air to rush from the reservoir to the cylinder and put on the brakes. A little auxiliary valve in the slide valve gives great control over the pressure, and accidental leaks are provided against by grooves opening to the air which shut when the brakes are put into action. Generally each cylinder has two pistons kept close together by springs; the compressed air enters between them, forcing them apart, and so working the brake-levers. The hose couplings for pipes between the carriages are automatic—i.e. a valve opens in them when the couplings are made, and closes if they are disconnected (except when forcibly torn apart as in accidents). Captain Galton made a valuable set of experiments on the friction between blocks and tires on the Brighton line, proving conclusively amongst other things that the pressure should not be so great as to cause the wheels to skid. His results were communicated to the Institution of Mechanical Engineers. An elaborate series of tests of rival brakes was made at Newark in 1875, the general result proving the Westinghouse to be the most powerful and quickest in application—for instance, it stopped a train weighing 203 tons, running 56 miles an hour, in 1020 feet.

For revolving drums, the brake is usually some form of strap which can be tightened strongly against the drum, causing great friction, and so pulling up the drum.

Later the word brake has been used for any form of engine dynamometer which measures power

given out by an engine by absorbing it in overcoming friction. The usual method is to hang a weight from a strap or series of blocks encircling a pulley or flywheel of the engine, then to tighten up these straps till the friction produced is great

Diagram of Westinghouse Automatic Brake, showing arrangement for one carriage:

A, reservoir; B, triple valve; C, slide valve; D, exhaust; E, brake-cylinder; F, release valve; G, spring; H, pistons; I, I, communication to brake-lever; K, main pipe extending all along the train; L, branch pipe; M, cock.

enough to cause the flywheel to tend to carry the weights round, or, as it is said, to keep them 'floating.' The weights so floated measure the brake horse-power of the engine.

Brama, or RAY'S BREAM (*Brama raia*), a bony fish closely related to the Coryphænas or 'dolphins,' and therefore belonging or nearly allied to the mackerel family. In this genus the body is laterally compressed and more or less deep, the spinous portion of the long dorsal fin is not well developed, and the tail is deeply forked. Ray's bream is found from the Cape seas northward to the Mediterranean, and even to British coasts. Its total length may be as much as 2 feet. The flesh is said to be very good.

Bramah, JOSEPH, inventor, was born at Stainbrough, near Barnsley, Yorkshire, April 13, 1748. A farmer's son, he was incapacitated in his sixteenth year for agricultural labours by an accidental lameness, so was apprenticed to the village carpenter, and afterwards obtained employment with a London cabinetmaker. Subsequently, he established himself in business in the metropolis, and became distinguished for the number, value, and ingenuity of his mechanical inventions, such as safety-locks, and improvements in water-closets (his first patent, 1778), which have continued in use till the present time; in pumps and fire-engines, in the construction of boilers for steam-engines, in the processes of making paper, in the construction of main-pipes, wheel-carriages, the beer-machine used at the bar of public-houses, and many others. In the year 1796 he patented the hydrostatic press known by his name, which ranks as his most important contribution to mechanical science (see HYDRAULIC PRESS). He patented a very ingenious machine for printing bank-notes in 1806, and was one of the first to propose the application of the screw-propeller. In all, he took out eighteen patents. It has been remarked that the germs of all his inventions may be found in the work of others, but that he possessed the genius of improving upon and practically applying the work of previous inventors. He died 9th December 1814.

Bramante, DONATO, architect, was born near Urbino in 1444. From 1472 to 1499 he resided in Milan, where he studied geometry and perspective, neither of which sciences was well understood by artists in his day. He was noted as one of the best painters in Lombardy; but his success in architecture eclipsed his fame as a painter. After the fall of Ludovico Sforza, Bramante went to Rome,

where he was first employed by Pope Alexander VI., and afterwards by Julius II. The first great work which he undertook for the latter was to connect the Vatican palace with the two pavilions of the Belvedere by a series of immense galleries; the second was the rebuilding of St Peter's Church, of which he laid the new foundation in 1506. When only a small portion of his plans had been realised, Bramante died at Rome, 11th March 1514, and succeeding architects departed widely from the original design of a grand cupola over a Greek cross. Among other works of Bramante in Rome may be mentioned the Cancellaria and Torlonia palaces, in which he adhered more strictly than in other works to antique forms, but not without a characteristic grace in his application of these.

Brambanan, a district of the province of Surakarta, Java, rich in remains of Hindu temples, of which there are six groups, with two apparently monastic buildings. The edifices are composed entirely of hewn stone, and no mortar has been used in their construction. The largest is a cruciform temple, surrounded by five concentric squares, formed by rows of detached cells or shrines, embracing an area of 500 feet square. In several of these *dagobas* the cross-legged figures of Buddha remain; but the larger figures which must have occupied the central temples have disappeared from all but one. The outer one consists of 84 temples; the second, of 76; the third, of 64; the fourth, of 44; and the inner one, of 28. In the centre stands the largest and most imposing structure of all. It is 90 feet high, and profusely decorated with mythological figures, which are executed in a very fair style of art. On the south face of the outside parallelogram there are two monstrous figures, with uplifted clubs, kneeling in a threatening attitude. One of the single Buddhist edifices is pretty entire, as are also about a third of the cells, but the rest lie strewn upon the ground.

Bramble, or **BLACKBERRY** (*Rubus fruticosus*), a plant common in Britain and most parts of Europe, having prickly stems, which somewhat resemble those of the Raspberry (q.v.). The flowers do not appear till the summer is considerably advanced, and the fruit ripens towards the

the straggling stems, affords the necessary security for neatness and order, and the care bestowed is repaid by abundance of fruit, very acceptable where wild brambles are not plentiful, and at a season when there is no other small fruit in the garden. This being one of the most variable of British plants, its systematic arrangement has been a matter of great controversy, especially among pre-evolutionary botanists. Baker enumerates 21 sub-species, of which most again pass into varieties. Some are very pretty, and reward cultivation on the rock-garden. In America, where they are called Blackberries, they are extensively cultivated for their fruit; and of late American kinds have been with advantage introduced into Britain.—Species of *Rubus* very similar to the common bramble, or varieties of it, abound in the northern parts of Asia, the Himalaya Mountains, and North America. See **RUBUS**.

Brambling, **BRAMBLE FINCH**, or **MOUNTAIN FINCH** (*Fringilla montifringilla*), one of the Finches (q.v.), very like the chaffinch, but slightly larger, and with a more forked tail. In the males, the crown of the head, the cheeks, the back and sides of the neck, and the upper part of the back, are mottled in winter with brown and black; but in spring all these parts have a rich velvety black. The throat and breast are of a rich fawn colour, which is also the prevailing colour of the wings. These are crossed, however, when closed, by an oblique band of jet-black, and by another oblique band of white. The quill-feathers are also black, edged with yellow on their outer webs; the tail-feathers black, edged with reddish white; the rump and the belly are white; a small tuft of feathers under each wing and some of the lower wing-coverts are bright yellow. The female has a reddish-gray head. So far as is known, this finch has no song, but only a monotonous chirp. It is a mere winter visitant in Britain, and even in the south of Sweden it is only a winter bird. It breeds in the more northerly parts of Europe and Asia, and is very widely distributed.

Bramhall, **JOHN**, a great anti-Puritan Irish prelate, was born in 1594, and educated at Sidney-Sussex College, Cambridge. He was already sub-dean of Ripon, and on the road to high preferment when he went to Ireland as Wentworth's chaplain in 1633. He soon became Archdeacon of Meath, and was consecrated Bishop of Derry in 1634. Bramhall's intolerance roused the wrath of the stubborn Scotch settlers in his diocese, and ruined the king's cause in Ulster. When the Civil War broke out, for safety's sake he crossed to England, but the royalist disasters soon drove him to the Continent. At Paris, he argued with Hobbes on necessity and the freedom of the will, but the dogmatic bishop was no match save in his own opinion for that subtlest of sceptics. The Restoration gave him the metropolitan see of Armagh, which he filled till his death in 1663. Bramhall closely imitated Land in policy, and even resembled him in person, but was far his inferior in intellect. Not strong but merely obstinate in purpose, the so-called Athanasius of Ireland by his impolitic intolerance sealed the doom of Episcopalian supremacy in Ulster. His collected writings have slumbered since their publication in 1677.

Brampton, a very ancient town of Cumberland, 9 miles ENE. of Carlisle by rail. It has a moot-hall, boarding schools, and breweries; there are coal-mines near. Two miles east stands the abbey of Lanercost (q.v.). Pop. of parish, 2790. There is another Brampton close to Chesterfield (q.v.), and several hamlets of the same name.

Bran is the material obtained from the outer covering or husk of grain during the process of

Branch of Common Bramble:
a, a flower; b, fruit.

end of it, continuing to be produced till the frosts of winter set in. The fruit is too well known to need description. Preserves are prepared from it of very delicate flavour, besides a pleasant and fairly potent wine. The bramble is little cultivated in Britain; but it seems to deserve attention at least as much as the raspberry, and shows great capacity for improvement by cultivation. A slight rail on each side of a row of brambles, to restrain

grinding, and which is separated from the finer flour before the latter is made into Bread (q.v.). It is generally met with in commerce in thin scaly yellowish-brown particles, with sharp edges, and its composition in 100 parts is as follows: Water, 14; fibrin, &c., 15; starch, 44; fat, 4; lignose and cellulose, 17; ash, 6. Bran contains a nitrogenous body called cereal, which is capable of producing, by a process of fermentation, a chemical change in the starch, dextrin, &c. of flour. Bread made of flour containing bran is known as Brown Bread (see BREAD). The main uses to which bran is put are in the feeding of horses and cattle, and poultry, and in clearing and brightening goods during the processes of Dyeing and Calico-printing (q.v.). In the practice of medicine, bran is employed as a warm poultice in abdominal inflammation, spasms, &c., and an infusion is used as an emollient foot bath. It is also used internally in catarrhal affections.

Branch. Branching. In the widest sense we may speak of branching whenever one part gives rise to another similar one, be it the thallus of the lowest plants, or the root or stem of higher ones; more strictly, however, the term is restrained to the ramification of stems. Branches then 'are secondary stems developed from a primary one, or tertiary from these, and so on.' The growing point in many cryptogams forks constantly, while in the higher plants we have a potential branch in every vegetative bud except the terminal one which continues the main axis (see BUD). The number and position of the branches is thus in the first place determined by those of the leaves, but in the vast majority of cases such exuberant ramification is impossible, and many or most of such buds perish early or never even develop. This arrest depends largely on individual circumstances, and the branches may thus come to have a quite irregular or at anyrate undefinable position; yet this is by no means always the case, even in our trees. The general aspect of trees depends more upon their mode of branching than the form or exuberance of their foliage; notably that broadest of all arboreal contrasts, between the spire-like growth of the coniferous trees and the more spreading deciduous ones. In the conifers the lateral branches often perish and are thrown off from below upwards, and the adult stem thus appears branchless to a great height; yet even here sooner or later a branchy head is formed, as in the familiar Scotch fir or the Italian pine. The predominance of the main axis over the branches may long persist in many deciduous trees, and especially in their fastigate varieties, like the Lombardy poplar; frequently, however, as in the elm, the main axis soon becomes altogether lost, or apparently continued by several main branches. The angle at which branches come off also largely varies; usually ascending and acute, they may be at a right angle—e.g. cedar—or even droop, as in 'weeping' trees. With regard to the conifers, it may be noticed that the shortened branchlet of the larch, with its tuft of needle-like leaves, is represented in the pines by a still more reduced form, which has only two leaves, surrounded at the base by a number of bud-scales. When the vegetative life of these ceases, the branchlet is disarticulated as a whole—a fact the more curious in relation to the separation of the large lower branches of the stem, which also snap off, leaving a clean cicatrix. That more or less distinct tendency to the development of the lateral buds, and the consequent subordination of the apical one, which all branching implies, may be traced from the general aspect of the tree into the details of its growth, and yet more fully into its inflorescence. Thus, while in the simplest case, the secondary axes are all subordinate to the primary one, as in

a pine-tree or a raceme, the growth of the branches tends continuously to predominate. The shorter, more rounded, and long-branched conifers and other trees, or the 'corymb' variety of the raceme, are the simplest cases of this; but more definite forms also arise. Thus, when the leaves are opposite, the large development of the lateral branches to an equality with the main stem may give a three-branched appearance, which is well exhibited by valerian (fig. 2). More frequently,

Fig. 1.—Mode of Branching in alternate-leaved plants; with series of modifications brought about by increasing subordination of the main axes and development of the secondary ones.

a, unmodified form, or racemose type; b, secondary axes lengthened (corymbose type); c, the secondary axes (arising in axils of leaves nearly as well developed as main axis (Umbellifers); d, primary axis quite arrested after giving off its first axillary bud; this develops as a secondary axis, its bud as a tertiary, and so on, the stem being thus a composite or 'false' axis.

however, the development of the lateral branches exceeds that of the apical one altogether, which may be reduced to flower-bearing or totally arrested, and *false dichotomy* is the result; the autumnal arrest of the apical bud of the main axis, with development of its two lateral ones in spring, the apparent forking of the mistletoe, and the 'dichotomous cyme' of the pinks or chickweeds, are all familiar instances of this. Where the leaves are alternate we may also have an apparent forking, due to the equal development of the axillary branch, as often happens in Umbelliferae; or the main axis may be reduced to terminate in a flower, as in the scorpioid and helioid cyme, or may be checked altogether, as in the shoot of the lime.

Fig. 2.—Similar modifications in branching in opposite-leaved plants:

e, primitive form; f, equal development of lateral branches (Valerian); g, arrest of main axis with development of secondary alone, and consequent resemblance to dichotomy (Mistletoe).

Where, as in most of these cases, the primary axis is not only checked by its secondary axis, but this bears a bud or tertiary axis, which again overpowers it, and so on, a *false axis* or *sympode* is formed. Physiologically indistinguishable from an ordinary main axis, examination shows that the leaves are not borne in the ordinary way, but have

developed the successive segments of stem in their respective axils.

The underground branches of a rhizome are often thickened as *tubers*; or they may send up tertiary branches to become new ascending axes—the *suckers* of the raspberry or rose. A *stolon* is a prostrate branch which roots at the tips and then develops an ascending branch; it may often be long and thread-like, and is then called a *runner* (strawberry). Branches may also undergo modifications from vegetative forms to new purposes—they may become sensitive and supporting as tendrils, their vegetative life may be diminished and their growing points hardened off as spines or thorns; the flower too is of course a reproductively shortened axis with modified appendages. See INFLORESCENCE.

Branchiæ. See GILLS.

Branchiopoda, a sub-order of Crustaceans in the order with leaf-like feet (Phyllopods). The name (gill-footed) refers to the fact that many of the numerous (10–40 pairs) appendages bear respiratory appendages. The body is distinctly jointed; the shell may be absent, shield-shaped, or bivalved; there are well-developed steering antennæ; the eggs are borne on several of the legs, or, in Branchipus and Artemia, in a special brood-sac. The heart is unusually elongated. They are mostly comparatively small, though not microscopic. Apus may be over 2 inches in length, and the brine-shrimp measures about half an inch. The males are less frequent, and often appear to be absent through a series of generations. The young mostly begin at the lowest level of crustacean life, known as the Nauplius (q.v.) stage, and pass through striking metamorphoses. None of the Branchiopoda are marine; a few live in salt-lakes and brine-pools; the rest in fresh water, in pools, ponds, marshes, lakes, &c. Only a few (*Apus*, *Estheria*) are known as fossils. See CRUSTACEA, BRINE-SHRIMP.

Branchiosotomum. See AMPHIOXUS.

Branco, RIO, a river of Northern Brazil, which rises in the Parima Mountains, on the very borders of Venezuela; and after a southerly course of about 400 miles, it joins the Rio Negro, of which it is the principal tributary, on its way to the Amazon.

Brancursine, a French popular name introduced by old writers for *Acanthus mollis* (see ACANTHUS); also applied to the Cow-parsnip (*Heracleum Sphondylium*).

Brand is the mark left upon the skins of cattle, often for the purpose of recognition by the owner, as in cattle-ranches in America, produced by searing with a hot iron; or a mark made in the same way on a cask or box for trade or excise purposes, hence the expression 'a good brand' of cigars, or the like (see FISHERIES, and TRADE MARKS). The Branding of criminals is a separate article. The name Brand is given to the fungoid diseases or blights of grain crops—Bunt (q.v.), Mildew, Rust, and Smut (q.v.)—and refers to the burnt appearance which characterises the diseases to which it is applied. See PLANTS (DISEASES OF).

Brand, JOHN, antiquary, born in Durham county, 19th August 1744, was apprenticed to a cordwainer in Newcastle, and educated at the grammar-school there. His industry raised up for him patrons, who sent him to Oxford, where he graduated B.A. in 1775. He had been ordained some years previously, and in 1784 he was presented to a rectory in the City of London; in the same year he was elected resident secretary of the Society of Antiquaries, to which office he was re-elected annually until his death, 11th September 1806. His *Observations on Popular Antiquities*, first

published in 1777, and edited with additions by Sir Henry Ellis (3 vols. 1813; new ed. by W. C. Hazlitt, 1870), is the best book on its subject in the English language.

Brandane. See BRENDAN.

Brande, WILLIAM THOMAS, chemist, born in London in 1788, was apprenticed to his brother, an apothecary, and studied chemistry at St George's Hospital. His first paper was read before the Royal Society in 1805, and he was elected a Fellow in 1809, having commenced lecturing on chemistry and physics the year before. In 1812 he was appointed professor of Chemistry to the Apothecaries' Company, and in 1813 succeeded Davy at the Royal Institution, where he was assisted by Faraday. He resigned in 1854, and was head of the coinage department of the Royal Mint until his death, 11th February 1866. He was a D.C.L. of Oxford, and published a *Manual of Chemistry* (1819; 6th ed. 1848), a *Dictionary of Materia Medica* (1839), and a *Dictionary of Science and Art* (1842; new ed. 1875).

Brandenburg, a central province of Prussia, formed the nucleus of the present monarchy, though the modern province does not quite correspond with the old *Mark* of Brandenburg, which included also parts of the province of Saxony and of Pomerania. Almost the whole province is a plain, so low that at Potsdam the surface of the river Havel is only about 15 English feet above the level of the sea. The ground becomes slightly hilly towards Silesia. In general, the soil is sandy and naturally unfruitful. Without its numerous rivers and canals, Brandenburg would be one of the most barren tracts on the Continent. The inhabitants are mostly Germans, mixed with French and Dutch colonists, who, however, are almost completely Germanised; and in the south of the province, with people of Wend extraction. Shipping, agriculture, and the rearing of cattle afford occupation for a considerable number. The chief manufactures are cotton, wool, linen, sugar, glass, tiles, and machinery. There are also numerous distilleries. The province is divided into the governments of Potsdam and Frankfurt—Berlin, which is the capital, forming a separate jurisdiction. Area, 15,410 sq. m.; pop. (exclusive of Berlin) in 1880, 2,266,651; in 1890, 2,544,783, of whom all but 89,951 Roman Catholics and 13,755 Jews belonged to the Protestant Church. In the beginning of the Christian era, Brandenburg was inhabited by the Semnones, and afterwards by Slavonic tribes. In 927 Henry I. defeated the latter at the Elbe, and plundered their capital of Brennbir, afterwards raising the district into a *Mark* (q.v.). Albert the Bear (q.v.) became the first Markgraf in 1134, and Frederick of Nuremberg the first Elector in 1415. The Mark or Electorate became united with the duchy of Prussia in 1611, which, under the Great Elector, Frederick-William I., shook off the suzerainty of Poland in 1637, to become, under the Great Elector's son Frederick, in 1701, the kingdom of Prussia. See PRUSSIA.

Brandenburg, the ancient *Brennbir* of the Wends, 38 miles WSW. of Berlin. The Old Town and the New are on either side of the Havel; on an island in the river stand the castle and the cathedral (14th century), with a fine crypt. The manufactures include woollens, silks, hats, baskets, leather, and starch. Pop. (1890) 37,817.

Brandenburg, NEU. See NEUBRANDENBURG.

Brandes, GEORGE, a Danish literary critic of Jewish family, born 4th February 1842, in Copenhagen, where he graduated at the university in 1864. Several books on æsthetic and philosophic subjects brought on him a charge of scepticism, which was not removed by an epoch-making series

of lectures, delivered before large audiences, and published under the title, *The Great Tendencies of Nineteenth-century Literature* (1872-75); for his description of the later intellectual position of Europe, as broken away from the orthodoxy and romanticism of the beginning of the century, brought on him the bitter attacks of all the reactionary forces in Denmark. His *Danske Digtere*, a masterpiece of psychological analysis, appeared in 1877; but the hostility of his enemies induced him in the same year to leave Denmark, and settle in Berlin, where he published, among other works, critical biographies of Lassalle (1877), Esaias Tegner (1878), and Lord Beaconsfield (1879). A lecture tour through Norway and Denmark brought a powerful party to his side, and in 1882 he returned to Copenhagen. Later works include *Den Romantiske Skole i Frankrig* (1882) and a *Life of Holberg* (1885). His three books on Ibsen (1867, 1882, and 1898) were translated into English and published together. *Shakespeare: a Critical Study*, appeared in 1898.

Branding has been practised from very early times. The Greeks marked their slaves with the *stigma*; in Rome, runaway slaves (*fugitivi*) and thieves (*fures*) were branded with the letter F; and the slaves who worked in the mines, and convicts condemned to the galleys or to the mines, were also branded on the forehead for identification. Constantine limited branding to the hand, arm, or calf; the face had been fashioned in the image of God, and was to be protected from such degradation. The Canon Law provided for this punishment, and in France, down to 1832, galley slaves were marked T F (*travaux forcés*); but in Germany it has never been recognised by the common law. Under the ancient law of England, branding was practised for various offences by the application of a hot iron, the end of which had the form which it was desired should be left imprinted on the skin. The famous Statute of Vagabonds under Edward VI. authorised the branding of the letter V on the breast of a runaway servant; and where such a servant had been sold, and afterwards escaped, he might be branded with the letter S on cheek and forehead as a slave. In the same reign, Brawling (q.v.) in church was punished by branding with the letter F on the cheek as a fraymaker. During the two centuries of persecution to which the Gypsies were subjected throughout Europe, this was a mild form of punishment; in 1636 some 'Egyptians' were sentenced at Haddington, 'the men to be hangit, and the women to be drowned; and suche of the women as hes children to be scourgit throw the birgh and brunt in the cheekes.' In the time of Henry VII. branding had been substituted for ecclesiastical purgation in the case of all *clerigable* offences by burning on the hand (see **BENEFIT OF CLERGY**); and with a view still further to repress theft and petty larceny, it was provided in 1698 that such offenders as had the benefit of clergy allowed them should be 'burnt in the most visible part of the left cheek, nearest the nose.' This additional severity, however, had not the desired deterrent effect, and was repealed in 1707. Cold branding, or branding with cold irons, was a way of nominally inflicting the penalty. Branding was discontinued in the reign of George III., and finally done away with in 1829. Army 'branding' or 'marking' with the letter D, or B. C. (Deserter or Bad Character), by tattooing with needles and Indian ink, not by burning, was abolished in 1879.

Brandis, CHRISTIAN AUGUST, was born in 1790 at Hildesheim, and from 1822 till his death on 24th July 1867, was professor of Philosophy at Bonn,

except that during 1837-39 he was cabinet-counsellor to the young king of Greece. With Bekker, he edited Aristotle, and he published two works on ancient philosophy. His son Johannes (1830-73) wrote on numismatics and Assyrian archaeology.

Brandling. See PAR, and SALMON.

Brandon, a quaint old market-town, mostly on the Suffolk side of the Little Ouse, $\frac{7}{8}$ miles NW. of Thetford, and S6 NE. of London by rail. It has a considerable trade in corn and rabbits. In the neighbourhood are the *Grimes Graves*, demonstrated by Canon Greenwell to be Neolithic flint-workings. Gun-flints are still made here, chiefly for the African market; and the continuity of this industry can be traced at Brandon in unbroken sequence to the early prehistoric periods, when the flint was excavated with stone tools and picks made of the antlers of the red deer. Pop. of parish, 2334.

Brandon, a place of growing importance in Manitoba, Canada, situated on the Canadian Pacific Railway, below the junction of the Assiniboine and Little Saskatchewan rivers, in a prolific wheat-growing district. It was founded in 1881, and in the following year had over 1500 houses. Pop. (1891) 3788.

Brandt, SEBASTIAN, author of the *Narrenschiff*, or Ship of Fools, was born at Strasburg, 1458; studied law and the classics with zeal at Basel, where he received permission to teach; and soon became one of the most influential lecturers in that city. The Emperor Maximilian showed his regard for Brandt by appointing him an imperial councillor. He died at Strasburg in 1521. His *Ship of Fools*, a satire on the follies and vices of his times, which was published at Basel (1494), is not very poetical, but is full of sound sense and good moral teaching, and was so much esteemed that the German popular preacher Geiler occasionally took his texts from it. The best editions are by Zarneke (1854), and Goedeke (1872). It has appeared in almost every European language; it was translated into Latin by Locher (1497), and into English by Henry Watson, *The Grete Schyppe of Foles of the Worlde* (1517); partly translated and partly imitated by Alexander Barclay (q.v.), and imitated by W. H. Ireland in the *Modern Ship of Fools* (1897).

Brandy (Fr. *eau de vie*) is a term properly restricted to the liquid obtained by distilling the fermented juice of the grape. The fermented liquors or wines which are employed for that purpose are various, and contain a proportion of Alcohol (q.v.), which runs from 10 to 25 per cent. of their weight. The red wines generally are preferred. In the 17th century, French brandy was made only from white wine. About 1000 gallons of wine give by distillation from 100 to 150 gallons of brandy, which varies in strength, but is generally diluted with water till it contains from 50 to 54 per cent. by weight of absolute alcohol. When originally distilled, brandy is clear and colourless, and if wished to remain so, is received and kept in glass vessels; but when placed in wooden casks, the spirit dissolves out the colouring matter of the wood, and acquires a light sherry tint, which may be deepened by burnt sugar and other colouring matter, intentionally added by the dealers. The pleasant aroma of brandy is due to the presence of more or less Fusel Oil (q.v.) accompanied by Enanthic Ether (q.v.), derived from a volatile oil in the husk of the grape. The most famous brandy is that distilled in the country round Cognac, in Charcutte, in the west of France, from the choicest wines, but comparatively little of that sold under the name of *Cognac* comes from this district. *Armagnac* is the brandy of another district. Since the vines of

France have suffered from oidium, phylloxera, and mildew, only a very small proportion of what is imported and sold as Cognac is made from wine, or even from cider, grape refuse, wine lees, and fruit. A British consular report from La Rochelle in 1887 affirms that most French houses (except a few of the most respectable) import potato-spirit in large quantities from Germany, and re-ship it to England as French brandy; beetroot-spirit is also much used; the coarse spirit being flavoured with ananthic ether, with Cognac oil (made from palm oil), the essential oil distilled from husks of the grape, and other flavouring matters. From 500,000 to 700,000 gallons of brandy are annually distilled in Portugal, almost exclusively from white grapes (which contain more alcohol than red ones), and a small quantity is also made from grape refuse (*more*). To produce 1 gallon of this brandy, 5 to 7½ gallons of wine are required. This brandy contains 75 per cent. of absolute alcohol (33 over proof of Sykes); and is principally used in checking fermentation in wine-making, and in preserving the sweetness of Portuguese wine. Some of the brandy sold in Great Britain and Ireland is prepared at home from ordinary grain-alcohol, by adding thereto Argol (q.v.), bruised French plums, some French wine-vinegar, a little good Cognac, and redistilling. The Germans use the name *Branntwein* for all kinds of grain-spirit, or that distilled from plums, blue-berries, &c. *Kirschwasser* or *Kirschbranntwein* is distilled from cherries and their kernels. In England, *cherry-brandy* is brandy in which cherries have been steeped and preserved. In the United States, brandy is also made from cherries, apples, pears, and peaches; and the States export much common whisky to France, which is reimported as brandy. Brandy is frequently administered as a stimulant, and in cases of suspended animation, exhaustion, and in mild diarrhoea. It may be used externally for checking hemorrhage, and for hardening tender skin. See ALCOHOL (USES OF), DISTILLATION, WINE.

The duty on brandy imported into Great Britain, which from 1814 had been as high as 22s. 10d. a gallon, was reduced in 1846 to 15s., and in 1860 to 8s. 2d., but was soon afterwards raised to 10s. 5d., and remained at this till June 1881, when it was reduced to 10s. 4d. The consumption in the United Kingdom from 1822 to 1862 averaged about 1,400,000 gallons; and for the ten years ending December 31, 1887, 3,058,987 gallons. The import in 1891 was 3,162,548 gallons, worth £1,419,028; and in 1892 it was 2,986,366 gallons, worth £1,346,763.

Brandywine Creek. a stream rising in Chester county, Pennsylvania, flowing with a general south-easterly course into Delaware, and emptying into Christiana Creek at the city of Wilmington. During the War of Independence, a battle was fought on its banks, September 11, 1777, in which 13,000 Americans, under Washington, were defeated by a force of 18,000 British, under Lord Howe.

Brank, or BRANKS, an instrument formerly used for the punishment of scolds in England and Scotland, and often in the former country called 'the scold's bridle,' or 'gossip's bridle.' It seems in England to have come in place of the ducking-stool or Cucking-stool (q.v.), and is said to be of Scotch origin; but according to Mr Llewellynn Jewitt it was never a *legalised* instrument of punishment, although corporations and lords of the manor in England, and town-councils, kirk-sessions, and barony courts in Scotland, exercised the right of inflicting such punishment. Men were put in the stocks or pillory, women in the branks, for such petty misdemeanours as are now described as breaches

of the peace, using abusive, insulting, or threatening language, cursing and swearing, and contumacy. The brank in its simplest form is a hoop of iron, opening by hinges at the sides, so as to inclose the head, and fastened by a staple with a padlock at the back; a plate within the front of the hoop projecting inwards, so as to fit into the mouth of the culprit, and by pressing upon the tongue, be an effectual gag. In some instances this mouth-plate was armed with a knife or point which cut the tongue if moved. In its last most complicated shape, the brank, by the multiplication of its hoops and bands, took the form of a conical cage or lantern, the front taking the shape of a rude mask, with holes for mouth, nose, and eyes; in one instance, the mask quite covers the face. With this cage upon her head the unfortunate woman was paraded through the streets by the bellman, beadle, or constable, or was chained to the market cross, a target for ridicule and insult. When the brank first came into use is unknown. It is found at Edinburgh in 1567, at Glasgow in 1574 and 1596, at Stirling in 1600, at Macclesfield in Cheshire in 1623, at Newcastle-on-Tyne in 1635, Worcester in 1658, Congleton in 1662, at Chesterfield, the only instance in Derbyshire, in 1688. Cheshire had thirteen examples extant in 1660. An old description of the Isle of Man mentions the tongue of a scandalous person being tied with a noose of leather called a bridle. One brank in the church of Walton-on-Thames, in Surrey, has the date of 1633. In another, called 'the witches' bridle of Forfar,' dated 1661, the gag for the mouth is not a flat plate, but a long piece of iron with three sharp spikes. A brank at Stockport was somewhat of the same description. Of examples in private custody in England, one had the date of 1688, the other the crowned cipher of King William III., and another had a mask with apertures for the eyes, a prominence to fit the nose, and a long funnel-shaped peak projecting from the mouth. The brank was used at Langholm, in Dumfriesshire, in 1772; at Morpeth in 1741; it was used at a later date at Manchester and at Macclesfield; and at Bolton-le-Moors, in Lancashire, the iron bridle was in use up to 1856 for the correction of immorality. Examples of the brank may be seen in the Ashmolean Museum at Oxford, in the National Museum of the Antiquaries of Scotland at Edinburgh, at Abbotsford, in the county-hall at Forfar, in the Guildhall at Lichfield, at Leicester, Newcastle-on-Tyne, Shrewsbury, in the town-hall at Macclesfield, in the parish church of Walton in Surrey, and in St Mary's Church at St Andrews in Fife; Chester has four examples. Brank was at one time a common name in Scotland for any sort of bridle, and the word is so used by Burns. The word is derived from the Gaelic *brangus*, an instrument for punishing petty offences, *brang*, a halter, words cognate with the Dutch *pranger*, pincers, and the German *pranger*, a pillory. See the paper by Llewellynn Jewitt, F.S.A., 'Scolds; and How they Cured them in the "Good Old Times,"' in *Reliquary*, vol. i. (1860-61); also notes in vol. xiii. (1872-73); and Andrews, *Punishments in the Olden Times*. See JOGS.—The affection called *Mumps* (q.v.), causing a swelling about the jaws or neck, is in Scotland vulgarly known as the *branks*.

Branks.

Brant, JOSEPH, chief of the Mohawk Indians, born in 1742, fought on the side of the British in the Indian and Revolutionary wars. In the latter he headed several fierce raids against the colonists, but was equally zealous afterwards in exerting his immense influence to bring about a general Indian peace. In later years an earnest Christian, he translated the Gospel of St Mark and the English Prayer-book into Mohawk, and in 1786 visited England to raise funds for the erection of the first Episcopal church in Canada. He died 24th November 1807. He was a brave warrior, a sagacious leader, loyal to his friends, and merciful to his captives. A monument to Brant, surmounted by a colossal bronze statue, was unveiled at Brantford in 1886.

Brantford, a town and port of entry of Brant county, Ontario, 24 miles SW. of Hamilton by rail, on the Grand River, which is navigable to within 2½ miles of the town, from which point a canal affords a waterway to Lake Erie. There are manufactures of metal and stoneware, machinery, and agricultural implements. Pop. (1891) 12,753.

Brantôme, PIERRE DE BOURDEILLES, SEIGNEUR DE, one of the most notable of French memoir-writers, was born about 1540 in the province of Perigord. The exact date and place of his birth are unknown. He was the third son of François, Comte de Bourdeilles, and was educated at Paris and at Poitiers. In his sixteenth year the abbacy of Brantôme was bestowed on him by Henry II., but he never took orders, and spent most of his life as a courtier and free-lance. In 1561 he accompanied Mary Stuart on her journey from France to Holyrood, and in 1565 he joined the expedition sent to Malta to assist the Knights of St John against the sultan. He served in Italy under the Maréchal de Brissac, in Africa under the Spaniards, and in Hungary as a volunteer against the Turks. He was made chamberlain to Charles IX. and Henry III., and took part against the Huguenots in the religious wars of his time. About 1594 he began to write his memoirs, and thenceforth lived in retirement until his death on the 15th of July 1614. His works were not published until 1659. They comprise *Vies des Grands Capitaines Etrangers et Français*, *Vies des Dames Galantes*, and *Vies des Dames Illustres*. Their literary merit and historical interest are very considerable. Their matter is often of the most scandalous description, but they give a wonderfully vivid and faithful picture of their author's times. Brantôme depicts the corrupt court society with the most complacent frankness; he writes as if he were immortalised rather than demoralised. He had a keen eye for character; the men and women who appear in his crowded, brightly-coloured pictures have each a lifelike, sharply-marked individuality. His style is easy, lively, and picturesque. There are editions of Brantôme by Lacour and Merimée (11 vols. 1859-94), and by Lalanne (10 vols. 1865-81).

Brash. See PYROSIS.

Brasidas, the greatest Spartan general in the earlier years of the Peloponnesian war. Already in 431 B.C. he had distinguished himself by the courage with which he relieved the town of Methone from a hostile attack, for which he was made one of the chief-magistrates of Sparta. In 424 he relieved Megara, and he was no less successful through combined diplomacy and military skill in his expedition to Macedonia, the same year, for the purpose of seducing the cities from their allegiance to Athens. His greatest acquisition was Amphipolis. Here in 422 he had to encounter with a handful of helots and mercenaries, the flower of the Athenian army under Cleon. In

the battle both generals were killed, but the army of the Athenians was completely beaten. He was buried at Amphipolis within the walls, and for long after his death his memory was honoured as that of a hero by the celebration of yearly sacrifices and games. Thucydides speaks of the eloquence of Brasidas, so unusual in a Spartan, as well as his justice, liberality, and wisdom; while Plato compares him to Achilles.

Brass. In ancient history, biblical and profane, frequent allusions are made to the employment of brass in the construction of musical instruments, vessels, implements, ornaments, and even gates; but as no mention is made of its mode of manufacture, or even of its composition, it is doubtful if the brass of the ancients, with the exception of some made by the Romans, was composed of copper and zinc. Dr Percy (*Metalurgy of Copper*, Murray, 1861) concludes, from the analysis of some of their coins, that the ancient Romans were well acquainted with the art of preparing brass, in the sense of an alloy of copper and zinc. However this may be, it was bronze, and to some extent iron, not ordinary brass, that was all but universally used by them for metal objects other than those made of gold and silver. Zinc does not appear to have been known as a separate metal in Europe till the 16th century; but no doubt one or more of its ores might have been employed by the Romans along with copper to prepare brass.

The term brass is commonly understood to mean an alloy of copper and zinc of a more or less yellow colour. Bronze (q.v.), on the other hand, means an alloy of copper and tin. But there is now a tendency to make brass a generic term, so as to include bronze as well as alloys of copper and lead. In this way, under one general name, there would be a zinc, a tin, and a lead group of alloys. For the tin group, see BRONZE.

ZINC GROUP (W. Graham)—

Pinchbeck brass	4	of copper to 1 of zinc.
Dutch brass (Dutch metal).....	3	" 1 "
Yellow brass.....	2	" 1 "
Pale brass.....	1.75	" 1 "
Ship sheathing brass (Muntz's metal)	1.50	" 1 "

LEAD GROUP (W. Graham)—

Stopcock metal.....	4	parts of copper, 1 of lead, 1 of zinc, and 4 of tin.
"	2	parts of copper, 1 of lead, and 1 of tin.
Tap and pot metals	Various proportions, from $\frac{1}{10}$ to 1 part of copper to 1 of lead.	

A tough brass for engine-work can be made of copper 6½, tin 1, and zinc 1; and another kind for very heavy bearings of copper 6½, tin 1, and zinc ½ (Spretson).

As a rule, brass is easily fusible and also very malleable and ductile. Therefore it can be readily cast into moulds, rolled into sheets, hammered or stamped into various shapes, and drawn into wire. It is likewise of a pleasing colour. Brass is harder, and so stands wear better than copper, resists atmospheric influences as well, and is cheaper than that metal. These valuable properties render it next in importance to iron and steel in the metallurgical arts. The malleability of brass, however, varies with its composition, with the temperature, and with the presence, even in minute quantities, of foreign metals. Some kinds are malleable only while cold, others only while hot, and there are varieties wanting in this property at any temperature. All kinds become brittle if heated well up to their fusing-point.

Brass is more tenacious than any of the common metals except iron, steel, and copper. But if subjected to a continuous tension for some length of time, it undergoes, in many cases at least, a molecular change, and loses its tenacity. It is therefore

not quite safe to hang pictures with heavy frames or weights of any kind on brass chains or wire. The surface of this metal, if not protected by lacquer, soon tarnishes and becomes black.

The old process of making brass by mixing small bits of copper with powdered zinc ore, and heating the mixture in pots in a furnace, is now almost obsolete. The modern way of preparing it is by mixing metallic zinc directly with copper in crucibles or in a reverberatory or cupola furnace. There is least waste with crucibles. The copper is first melted, and the zinc then added in a hot state, care being required to prevent much loss by the latter volatilising. When other metals are added they are also heated first.

From the crucibles the molten brass is either poured into moulds to form ingots for remelting, or more commonly into ordinary sand moulds prepared from patterns (see FOUNDRY). Brass takes a sharp impression when cast in a mould. Plates or slabs for rolling into sheets are cast between two marble blocks thinly lined with loam, the sides and ends being made up with sand. These are reduced by 'breaking-down rollers,' and afterwards by other rollers, till they become of the required thickness. As is the case with tube and wire drawing, these sheets are annealed at intervals during the process of rolling. See ANNEALING.

Ordinary drawn brass tubes are soldered longitudinally, but the tubes for locomotive boilers are formed by drawing out a solid cylinder of brass. This was looked upon as a great feat, when the process, after many trials, first succeeded in 1838.

The industries which either wholly or partially depend upon brass for their raw material, so to speak, are so numerous and so varied, that even the more important of them would form a considerable list. Birmingham is the headquarters of these industries. See ALLOY, METALLURGY, METAL-WORK, WIRE; and works on brass-founding by Larkin (1866), and Graham (1887).

Brasses. MONUMENTAL, large plates of brass, or of the mixed metal called *latten* or *laton*, inlaid on slabs of stone, and usually forming part of the pavement of a church. The figure of the person intended to be commemorated was generally represented either by the form of the brass itself, or by lines engraven on it. Such, however, was not always the case, an ornamented or foliated cross, with other sacred emblems, being frequently substituted for the figure. Nor was the practice of imbedding them in the pavement uniform, as we sometimes find them elevated on what were called altar-tombs. The incised lines on these brasses were occasionally filled up with *niello*, and in the case of armorial decorations and the like, the field or background was often cut out by the chisel, and filled up with some species of coarse enamel, by which means the appropriate tinctures were produced. In England, the brass was usually of the form of the figure, the polished slab forming the ground, and the ornaments, arms, inscription, &c. were also inserted each as a separate piece. On the Continent, where the metal was more abundant, the brasses were one long unbroken surface, formed of plates soldered together, on which were engraved all the objects represented, the portions of the plate not so occupied being ornamented by elaborate flower-work. Brasses are known to have been used for monumental purposes from an early period, though there are no existing traces of them in England previous to the middle of the 13th century. There is reason to think that, if not imported from France, they were at first executed by French artists, but as no example of a brass exists now in France, it is impossible to establish this. Subsequently the art took root in England,

and English brasses, like English architecture, acquired a distinctive national character. The oldest complete specimen in England is that on the monument of Sir John d'Aubernon, at Stoke d'Aubernon, in Surrey. The knight died in 1277, and it is probable that the brass was executed shortly after that date. Next in antiquity are those of Sir Roger de Trumpington, who died in 1289, and of Sir Richard de Buslingthorpe, 1290; the former at Trumpington in Cambridgeshire, the latter at Buslingthorpe in Lincolnshire. In addition to the interest which they possess from their age, these brasses are remarkable as being still unsurpassed in the beauty of the workmanship and the spirit of the design. In the following century (1325), on the brass of Sir John de Creke, at Westley Waterless, in Cambridgeshire, the artist's

Inlaid brass Monument of Eleanor Bohun, Duchess of Gloucester (about 1400).

mark is affixed by a stamp—a fact which has been regarded as a proof that his craft had attained to some importance, and that his services were pretty frequently called into requisition. But in this case, as in every other, with one exception, the name of the artist has perished. The exceptional case is that of the brass which once covered the tomb of Bishop Philip, in the church of the Jacobins at Evreux, in Normandy, where the inscription ended with the words, 'Guillaume de Plalli me fecit.' Some of the brasses executed in England in the 14th century are probably Flemish; and in the churches at Bruges some exist which appear to be by the same hand as others which are found in England. But England is the only country which now possesses a series of brasses fairly representative of the different periods,

and exhibiting the characteristics of a national style. Very few brasses are to be found in Wales, and there are only two on record in Ireland, and three unimportant examples in Scotland. For this, as for most other arts that subsequently flourished in Britain, we were indebted to the artists of France and Flanders, who in their turn were debtors to Byzantine craftsmen for the art of working in brass also. Of late years there has been a decided revival, not merely of interest in the art, but in the use of it in Britain for its original purpose—for the most part in rather close imitation of ancient patterns and methods.

See Cotman's *Sepulchral Brasses in Norfolk* (1819), Bontell's *Monumental Brasses of England* (1849), Haines' *Monumental Brasses* (1861), Greeny's *Monumental Brasses of the Continent of Europe* (1884), and Macklin's *Monumental Brasses* (1891).

Brass Estuary, or **BRASS RIVER**, one of the deltaic mouths of the Niger (q.v.), east of the Nun mouth, entering the sea about 6° 15' E. long. On it is Brass City, and hence the Brassmen, energetic savages, are named. The country is in the British Niger protectorate.

Brassey, THOMAS, the great railway-contractor, was born, a farmer's son, at Buerton near Chester, 7th November 1805, was educated at Chester, articled to a land-surveyor, and in 1826 had charge of a business in this line at Birkenhead. In 1834 he obtained, through George Stephenson, contracts for a viaduct on the Grand Junction line. Settling in London in 1836 he turned his great energies and business ability into his profession as a railway-contractor, for which the development of the railway-system presented a good opening. His operations soon extended to all parts of the world. Amongst his chief contracts were the Great Northern Railway (1847-51), when he had in his employment between 5000 and 6000 men; as also French, Italian, Canadian, Australian, and Indian railways. He died at Hastings 8th December 1870. See Helps's *Life and Labours of Brassey* (1872).—THOMAS, BARON BRASSEY, eldest son of the preceding, was born at Stafford in 1836, and called to the bar in 1866. He was elected for Devonport in 1865, and afterwards represented Hastings (1868-86). As Civil Lord of the Admiralty (1880), and Secretary (1884), his influence has been felt in naval questions, and he is author of several works on seamanship and naval affairs. He was made K.C.B. in 1880, and was raised to the peerage in 1886. He is a veteran yachtsman; and Lady Brassey's pleasant records of their yacht voyage round the world in 1876-77, and of succeeding trips of the *Sunbeam*, including the posthumous *Last Voyage* (1889), were widely popular. She died at sea, 14th September 1887. Lord Brassey is author of *Work and Wages* (1872), *British Seamen* (1877), *The Eastern Question* (1878), *The British Navy* (5 vols. 1882-83), *Voyages and Travels* (1895), *Papers and Addresses*, the *Naval Annual*, and of **COALING STATIONS** in this work. In 1895 he was made governor of Victoria.

Brassica, the turnip and cabbage genus of the Cruciferae (q.v.). The Wild Cabbage (*B. oleracea*) occurs on the west and south coasts of England, Ireland, and the Continent, particularly on sea-cliffs. The cultivated forms are of great economic importance, and are enumerated by Hooker as varieties: (a) *acephala* (Scotch kale, cow-cabbage, borecole, see KALE); (b) *bulbata* (savoy); (c) *gemmifera* (Brussels Sprouts, q.v.); (d) *capitata* (red and white cabbage, see CABBAGE); (e) *caulorapa* (Kohlrabi, q.v.); (f) *botrytis* (Cauliflower and Broccoli, q.v.). The Turnip (*B. campestris* (*polymorpha*)) has also many annual or biennial varieties: of these *B. campestris* proper

is cultivated as the Swedish turnip. *B. campestris*, sub-species *Rapa*, is the common Turnip (q.v.); and the sub-species *Napus* is the rape or coleseed. The Isle of Man Cabbage (*B. monensis*) occurs on sandy shores, and its cultivation in such soils has accordingly been suggested as fodder for cattle. For the sub-genus *Sinapis*, see MUSTARD.

Brathwaite, RICHARD, minor poet, was born in Westmoreland about 1588: entered Oriel College, Oxford, at sixteen; passed afterwards to Cambridge, Pembroke College most likely, and thence to London, where he tells us he devoted himself to poetry and play-writing. In 1611 he published *The Golden Fleece*, a collection of poems, and in 1614 three works, one of them a book of pastorals, entitled *The Poet's Willow*. In 1615 he published the collection of satires, *A Strappado for the Devil*, in imitation of *The Abuses Whipt and Stript* of George Wither, his 'bonnie brother.' After his first marriage, Brathwaite lived the life of a country gentleman in Westmoreland, and after his second in Yorkshire, without, however, ceasing his literary activity. He died near Richmond, in Yorkshire, in 1673. Of his numerous books, the only one that remains to be mentioned is *Barnaby Runicarium*, or *Barnaby's Journal*, published in 1638 under the pseudonym 'Corymbæus.' Often reprinted under the title of 'Drunken Barnaby's Four Journeys,' this lively book in rhymed Latin and doggerel English verse was popular in the 18th century, and had the honour of an eleventh edition in 1876. With the seventh edition, edited by Joseph Haslewood in 1818, its authorship was first made known. See the life and bibliography, forming a preface to Haslewood's ninth edition (1820).

Brattleboro, a post-village of Windham county, Vermont, 110 miles S. of Montpelier by rail, on the Connecticut River, which is here crossed by a bridge. Organs, carriages, furniture, and machinery are manufactured, and the town is a centre of the maple-sugar industry. Pop. 6862.

Brauer, ADRIAN. See BROUWER.

Braun, ALEXANDER, born at Ratisbon in 1805, was professor of Botany at Berlin from 1852 till his death, 29th March 1877. He did special service in the departments of the morphology of plants, systematisation, and the lower cryptogams. See his *Life* by Mettenius (Berlin, 1882).

Braun, AUGUST EMIL, archaeologist, born at Gotha in 1809, studied at Göttingen and Munich, and in 1833 went to Rome, where in a short time he was made secretary to the Archaeological Institute. He wrote many valuable works on art and mythology in German and Italian. Of these the most important are his *Vorschule der Kunstmythologie* (1854), and an admirable guide-book, *Die Ruinen und Museen Roms* (1854), both of which have been translated into English. He died in Rome, September 12, 1856.

Braunsberg, a town of East Prussia, on the navigable Passarge, 8 miles from its mouth, and 38 miles SW. of Königsberg by rail. It contains a Catholic seminary and gymnasium, and manufactures machinery, felt, and leather goods. A considerable trade is carried on in yarn, grain, flax, and ship-timber. Pop. 10,851.

Bravo ('excellent!' 'well done!'), an Italian exclamation of praise, the superlative form of which is *Bravissimo!* It is commonly used in England without distinction of number or gender; but the Italians say *bravo!* to a male singer or actor, *brava!* to a lady, and *bravi!* to a company of actors or singers.

Bravoos were those persons in Italy, but especially in Venice, who undertook to perform

any dangerous deeds for money. The name is now employed chiefly to designate hired assassins.

Bravura, an Italian word, in music applied to a composition as well as style of performance. As a composition, the bravura is a florid air or song, with many difficult and rapid passages, requiring great spirit and dexterity of execution. The intention of merely astonishing by execution has been carried to such an extent that it has brought this species of composition into undeserved discredit. The compositions of Mozart, for instance, give abundant proofs of how true artistic merit may be united with the bravura style.

Brawling in Churches, in the law of England, was an old statutory offence in the ecclesiastical courts. If it was committed by words only, the bishop might exclude a lay offender from church, and might suspend a priest. In more serious cases excommunication and branding were the punishment. Anglican priests may still be punished for such conduct by their own courts; but the riotous, violent, or indecent conduct of laymen in any place used for religious worship is dealt with by the ordinary criminal courts.

Brawn (M.E., 'muscle,' 'boar's flesh; ' akin to Ger. *braten*, 'to roast'), a preparation of meat made from pig's head and ox-feet, cut up, boiled, pickled, and prepared into a shape. The brawn of Wiltshire is celebrated, and it is also a famous dish in Canterbury.

Braxy, or SICKNESS, is a name loosely used to indicate a disease in sheep; but in different parts of the country totally different disorders are included under this head. Of the two most generally recognised as braxy, the one is an intestinal affection attended with obstinate diarrhoea; the other is a blood disease, and the result of plethora or fullness of blood. The second, which is spoken of by the better informed shepherds as the true braxy, may best be described here, and is most usually seen in hogs or sheep a year old. The disease is most prevalent during the months of October, November, and December, and occurs almost as an epidemic after a dry summer which is followed by an autumn aftergrowth. It also occurs among hogs which have been removed from a poor pasture into turnips or rich succulent grass. The sudden alterations of diet cause irritation of the stomach and bowels, which is followed by the generation of gases, and acute inflammation of them, resulting in sudden death. It also occurs in hogs which are in very high condition, and whose digestive systems have been so overworked that they cease acting; and as a consequence, gases are generated in the bowels and stomach, and inflammation following, death quickly ensues.

The majority of cases are found dead, but in the few which have been noticed during life, the following symptoms have been observed: loss of appetite, walking with an arched back, short steps, signs of pain, hurried breathing, swelling of the abdomen, then convulsions and death. Putrefaction sets in almost before death. After death the flesh appears of a dark-red colour, and the veins are charged with dark blood, but, on the whole, the body of the sheep looks so well that the mountain-shepherd cuts it up to make 'braxy mutton.' The bowels are found much inflamed and filled with gases, but there are no other special symptoms than the above to indicate the disease.

In the second form of braxy, chronic indigestion is induced by bad, unwholesome, non-nutritious foods, which cause constipation, dropsy of the dewlap, limbs, and abdomen, and terminates in death from bloodlessness, or in other words, starvation.

The prevention of the disease alone affords hope, and it consists in regulating the animal's diet, to prevent sudden transitions from low to rich keep; to mix food so as to modify the action of the more highly nitrogenous kinds; and to check the development of plethora or fullness of blood by saline purgatives and diuretics, such as Epsom and Glauber salts or nitre.

Bray, a small Berkshire parish, near Maidenhead, of which Simon Aleyn was vicar from 1540 to 1588, during the reigns of Henry VIII., Edward VI., Mary, and Elizabeth. He kept his vicarage by changing his faith according to that of the state for the time being, becoming a Protestant with Henry, Catholic again in the reign of Mary, and Protestant again on the accession of Elizabeth. His principle was to live and die vicar of Bray, and to it he adhered. The modern ballad, *In Good King Charles's Golden Days*, makes the versatile vicar live in the reigns of Charles II., James II., William III., Anne, and George I.

Bray, a seaside town, partly in Dublin county, but chiefly in Wicklow, 13 miles SE. of Dublin by rail. The beauty of its situation has raised it from a small fishing-village to a watering-place, popularly known as the 'Irish Brighton,' with well-built houses, and an esplanade a mile long, hotels, and Turkish baths. Pop. 6888.

Bray is a district of Normandy, now the south-eastern part of Seine-Inférieure, famous for its cattle and dairy produce.

Bray, ANNA ELIZA (*née* Kempe), author, was born in London, 25th December 1790, and was intended for the stage, but in 1818 married the artist, Charles Alfred Stothard (1786-1821). In 1825 she married the Rev. E. A. Bray (1778-1857), vicar of Tavistock; and after his death she settled in London, where she died, 21st January 1883. Between 1820 and 1874 she published a score of romances, books of travel, and other works, the best being *The Borders of the Tamar* and *The Tary* (1836; 2d ed. 1879); *Life of Thomas Stothard, R.A.* (1831); and *A Peep at the Pictures* (1854). Her Autobiography was edited by Mr Kempe in 1884, in which year also appeared a 12 vol. edition of her romances.

Bray, THOMAS, divine and philanthropist, born at Marton, in Shropshire, in 1656. From Oswestry School he passed to All Souls, Oxford, where he graduated in 1678. In 1690 he was presented to the rectory of Sheldon, and here he wrote part of his *Catechetical Lectures*, which brought him a wide reputation. Soon after he was selected to act as the Bishop of London's commissary in Maryland in the settlement of the church there. Not being able to start at once, he devoted himself with characteristic energy to a scheme for establishing parochial libraries in England and America, and had such success that before his death eighty had been founded in England and thirty-nine in America. Out of his library scheme grew the Society for Promoting Christian Knowledge; and he may also be regarded as the founder of the Society for the Propagation of the Gospel. About the close of 1699 he sailed for Maryland, but in 1706 returned to England to accept the living of St Botolph Without, Aldgate, where he laboured with the utmost devotion. He died February 15, 1730.

Brayera. See CUSO.

Brazil, the largest state of South America, and the third largest political division of the Western Continent, is greater in area than European Russia, Austria-Hungary, Germany, France, Norway and Sweden, Denmark, Italy, and Greece together. It extends from 4° 30' N. to 33° S. lat., and

from 35° to 73° W. long., having a length of 2660 miles, and a breadth of 2705 miles between extreme points (*Carta Geral*, 1883). Its coast-line extends from Cape Orange on the north to Rio Chuy on the south, a distance of nearly 4000 miles. It borders on every state in South America except Chili, but the boundary lines with some of them are still in dispute. The area of Brazil, estimated by some as high as 3,288,000, is more likely about 3,219,000 sq. m. (3,219,134, *Carta Geral*), or nearly one-half of the South American continent.

Physical Features.—Brazil is a triangular-shaped country, occupying the eastern angle of the continent. It lies almost wholly within the tropics, and is still in great part unexplored and unsettled. On the north and west are the great depressions of the Amazon and Paraguay rivers, which comprise large areas of flood-plains and swamps, heavily wooded, and almost uninhabitable. The upper coast is bordered by low, alluvial bottom-lands and sandy plains, full of lakes, and in places very sterile; while the southern angle of the country is rolling *campo* land, bordered by a low sandy coast. Above its eastern angle a large area of coast-lands and neighbouring plateau is subject to periodical devastating droughts. The interior of the country, however, is a high plateau, with a general elevation of 1000 to 3000 feet, irregularly ridged by mountains and deeply cut by large rivers. The mountainous ranges of the maritime system form the eastern margin of this plateau, the easternmost of which is known as the Serra do Mar. This range plays an important part in the development of Brazil, for it is a costly barrier to communication with the interior, and turns nearly all the great rivers inland to find outlets through the distant Amazon and La Plata. To the west of the maritime system the elevated tablelands of the Paraná and San Francisco make great bay-like indentations in the northern and southern margins of the mountainous area, nearly uniting about the head-waters of the latter. To the westward of these plains there is a second range, nearly parallel with the maritime system, constituting the mountains of Goyaz. To the westward of these come the great elevated plains of the Amazonian and Upper Paraguayan regions. The mountains are composed almost exclusively of uplifted strata of great geological age, gneiss and metamorphic schists, with granite and other eruptive rocks. The great elevated plains are composed of horizontal strata dating from the Silurian age, so profoundly modified by the deep excavations of the valleys that this part of the country is generally, but erroneously, represented as mountainous. Brazil possesses three great river-systems—the Amazon, La Plata, and San Francisco. The Amazon and its tributaries drain fully a half of the country. To the east of the Madeira these tributaries are tableland rivers, broken by rapids and freely navigable for comparatively short distances. West of the Madeira they are lowland rivers, sluggish, bordered by extensive flood-plains, and afford free navigation for long distances. The La Plata system drains nearly one-fifth of the country through its three branches—the Paraguay, Paraná, and Uruguay. The first of these is a lowland river, freely navigable for a long distance, while the other two are tableland rivers, full of obstructions, and without free outlets for their upper-level navigation. The San Francisco is a tableland river, flowing north-east between the Goyaz and maritime mountains, and then, breaking through the latter, south-east to the Atlantic. Its tributaries are comparatively short, and nearly disappear along the lower river in the region of slight rainfall. It is not freely navigable because of the Paulo Afonso Falls. The other coast-rivers are

generally short, the longest being the Parahyba, and have but little utility for navigation. The climate of Brazil varies greatly—the lowlands of the Amazon and a great part of the coast being hot, humid, and unhealthy, while the tablelands and some districts of the coast swept by the trade-winds are temperate and healthy. See AMAZON, AMERICA.

The vegetation of Brazil is luxuriant and varied. The vast forests of the Amazon contain hundreds of species of trees, draped and festooned by climbing plants, lianas, orchids, &c. Rosewood, Brazil-wood, and others supply valuable timber; tropical fruits are abundant, and other products are noted in the section on commerce. The number of species of animals is also very large, but the individuals in each are comparatively few. Beasts of prey are the jaguar, puma, tiger-cat, and ocelot; the other animals include the monkey, tapir, capybara, peccary, ant-eater, sloth, and boa-constrictor. Alligators, turtles, porpoises, and manatees swarm in the Amazon; and among birds, the parrots and humming-birds are especially numerous.

Population.—The population of Brazil, according to the census of 1872, was 9,930,478 of all races and classes, not including about 250,000 wild Indians. As immigration has been small, and the rate of mortality is very large, the annual rate of increase since then has probably not exceeded 1 per cent., which gives an approximate population of 14,950,000 at the close of 1892. The proportion of non-producers is very large, the natural conditions of the country rendering labour but slightly necessary to meet the ordinary requirements of life. The institution of slavery has had much to do with this state of things, by degrading manual labour, and making idleness respectable. The African slave-trade was prohibited in 1831, but did not actually cease until 1854. In 1871 a gradual emancipation law was adopted, which declared the children born thereafter of slave mothers to be free, but obliged to serve the mother's master until the age of twenty-one years. It also provided for a fund with which to liberate slaves by purchase. The number of slaves registered in 1873 under this law was 1,540,796. Through the operations of the fund 30,014 slaves had been ransomed up to the beginning of 1887, at a total cost of Rs. 19,694,0798 (*milreis*), to which the slaves contributed Rs. 1,614,4058 from their own savings. The number of slaves voluntarily liberated and ransomed through private efforts was very large, and two provinces (Ceará and Amazonas) had been declared entirely free. In 1885 a second law was adopted, providing for a new registry, declaring all sexagenarians free, but with obligatory service until the age of sixty-five years, and fixing an official valuation on all slaves, to prevent further abuses of the emancipation fund. The official returns of the registry under this law (closed March 31, 1887) gave 723,419; the number of sexagenarians liberated was about 100,000, and the number enrolled for obligatory service under the law was 18,946. Finally, by the law of 13th May 1888, immediate and unconditional emancipation was decreed, although Brazil had been unable wholly to replace the system of slave labour. Immigrant labour was still limited, the poorer rural population was both untrained and opposed to habits of industry, and the labour of freed slaves had hitherto been utilised only to a limited extent. Recent events, however, have proved that kind treatment and good pay will keep a very large percentage of the freedmen on the plantations.

The Roman Catholic was the established religion under the empire; under the republic there is no state church, and all sects are tolerated. There are less than 30,000 non-Catholics in the country.

Education is compulsory in several provinces, but is still in a very backward condition; 84 per cent. of the population was returned as illiterate at the last census. The language is Portuguese, with dialectal varieties, discussed by Vasconcellos in *O dialecto Brasileiro* (Oporto, 1883); and the literature, which dates back to the 16th century, will fall to be noticed under PORTUGAL.

Government.—Under the empire the government of Brazil was a constitutional monarchy whose executive governed through a cabinet of seven members—empire, finance, war, marine, justice, foreign affairs, and agriculture—and through a president in each of the twenty provinces of the empire. The executive power was vested in the emperor and his cabinet, the legislative in a General Assembly of two houses—the Senate and Chamber of Deputies—and the judicial in a council of state (advisory only), a supreme tribunal, twelve district courts, and the usual subordinate courts. At the revolution of 1889 the empire became a republic, and in 1891 the new constitution was proclaimed by a national congress convoked by the provisional government. The United States of Brazil are a federative republic, each of the old provinces and the federal district forming an organised state administering its own affairs at its own expense, and having distinct administrative, legislative, and judicial bodies. But the federal government takes charge of national defence, public order, and federal law, as well as customs, stamps, postal arrangements, and the issue of bank notes. The national congress, the legislative authority, consists of a Chamber of Deputies and a Senate, which meet annually; and the president's sanction is required to new laws. No member of congress can accept any paid office except diplomatic or military; nor can he hold contracts under government. Neither deputies nor senators can be ministers of state; both are paid. Deputies, who must have been citizens of the republic for four years, are elected by the direct vote of the several states for three years, in the proportion of one to 70,000 of the population. Senators are chosen by the state legislatures, three for each state, and for a term of nine years. The president has supreme command of army and navy, power to declare war and make peace (within certain defined limits), appoints and dismisses ministers, and with the assent of congress, ambassadors and the judges of the Supreme Federal Court. All citizens of twenty-one years duly enrolled exercise the franchise, except illiterates, beggars, soldiers in service, and monastics under vows.

The army of Brazil consists of 30,000 men, besides 15,000 gendarmes. The navy comprises 60 vessels of all classes (including two powerful turret-ships and 10 other armour-clads), manned by 8900 officers and men (including marines).

Finance.—The revenue of Brazil has varied from 195,253,406 milreis in 1890 to 346,164,000 milreis in 1899; the expenditure, from 220,645,844 milreis in 1890 to 346,000,423 milreis in 1899. Of the revenue for 1899, 222,000,000 milreis were derived from import duties, 45,080,000 milreis from railways, and 12,900,000 milreis from post and telegraphs; the other items being stamps, lottery taxes, tobacco duties, and various. The public debt in 1898 was 2,000,277,691 milreis. The milreis of 1000 reis is of the par value of 2s. 2½d.; but the actual value of the paper milreis fluctuates greatly. In 1891 it was 12½d.; in 1896, between 8d. and 10d.; in 1898, 5¾d.; and in 1900, 7½d.

Commerce.—The total value of the exports from Brazil in 1897, exclusive of specie, was 831,806,918 milreis; and of the imports, 671,603,280 milreis. The industries are confined to agriculture, mining, and forest products, manufactures being but

slightly developed. Stock-raising has totally failed to keep pace with the domestic consumption of jerked-beef, which is largely imported. The coast fisheries have also been neglected, although Brazil is a large consumer of codfish. The forest products are rubber, maté, nuts, cocoa, medicinal plants, cabinet and dye woods, &c.—the first ranking third in importance as an article of export. Of agricultural products, coffee occupies the first place, and furnishes about two-thirds of the total exports of the whole empire. The Rio and Santos export in 1886-87 was 5,871,170 bags of 60 kilogrammes each. The normal export from the whole empire is 6½ to 7 millions of bags. Sugar ranks second in importance as an export, and is now receiving special encouragement from the state, in the grant of interest guarantees on central usines. The production of cotton and tobacco has considerably decreased, and that of tapioca has nearly disappeared. Rice, maize, and many other products are easily grown, but have been overshadowed by coffee and sugar, and to some extent discouraged by the high cost of internal transportation. In colonial times the mining industries attracted much attention, and yielded large results. They are now comparatively unimportant, and are restricted in development by unfavourable mining laws. Gold and diamonds are found in Minas Geraes, Paraná, and Bahia, but the annual production at present is not large. Iron ores of superior quality exist in several provinces, but there are no large mines in operation, the absence of coal being a serious obstacle to the development of this important industry. The productions and commerce of Brazil cannot be treated briefly and comprehensively, because of the total lack of reliable statistics. There are no trustworthy official reports on these matters, the tables given being so defective and full of clerical errors as to render them valueless. An official report for 1884-85 gives the aggregate value of the agricultural, grazing, and extractive products for that year at about Rs.237,000,000\$. The total value of imports in 1890 was estimated at Rs.260,100,000\$; that of exports at Rs.317,822,000\$, of which coffee alone contributed more than half. The imports from Britain in 1892 had a value of £7,910,000, the exports to Britain £3,512,000. The mistaken policy of levying export duties on domestic products, and heavy import duties on foreign goods, has done much to restrict production and commerce. Moreover, the system of protection is even gaining ground, and a few industries have already been established on the encouragement given. As no land-tax, which would be opposed by the great landed proprietors, is levied, the loss of revenue through any effort to protect national industries will certainly lead to serious financial difficulties. It should be added that the inhabitants of the southern provinces of the empire are broadly distinguished by their energy from the more indolent northerners. It is in the southern provinces that the numerous German colonies (comprising some 220,000 Germans) are mostly established.

Steam communication with Europe was opened in 1850, and telegraphic communication in 1874. The first railway was opened in 1854; Brazil now possesses a total extension of 8630 miles under traffic, and 4800 miles in construction. Of these, 1580 miles under traffic belong to the state. There are 10,000 miles of telegraph lines in Brazil. Trade has been seriously hindered by the insurrections in Rio Grande, San Paulo, and Rio Janeiro (q.v.) in 1891-93.

History.—As early as 1480, expeditions sailed from Bristol in search of the island of Brasylle (for the name see BRAZIL-WOOD), rumoured to exist in the western seas; Brazil was discovered on 26th January 1500, by Vicente Yañez Pinzon, who landed

at Cape St Augustine, near Pernambuco, and then followed the coast north to the Orinoco. In the same year a Portuguese expedition to the East Indies, under Pedro Alvarez Cabral, discovered the Brazilian coast near Porto Seguro on 25th April (April 22, *Cazel*). Cabral took formal possession, and named his new discovery 'Terra da Vera Cruz.' Two Portuguese expeditions were sent out in 1501 and 1503, the first exploring the coast from 5° to 32° S. lat., and the second planting a colony and bringing back a rich cargo of Brazil-wood (q.v.), which gave a name to Portugal's new possession.

In 1530 the Portuguese government resolved upon the definite settlement of Brazil, and the plan adopted was its division into hereditary captaincies, which should be granted to private individuals, with ample powers for the founding of colonies on their own account. Many of the earliest colonies failed through lack of means, and from inability to hold their ground against the natives. In 1567 a Huguenot colony, established on the bay of Rio de Janeiro twelve years before, was overthrown by the Portuguese, who then founded the present capital of Brazil. Portugal and her colonies having become dependencies of Spain, a squadron sent out by the Dutch in 1623 to seize Brazil captured the colonial capital, Bahia. The Dutch lost the city in 1625, but in 1630 they captured Pernambuco, which, with several neighbouring places, they held for over twenty years. In 1640 Portugal regained her independence, and in 1654 her former possessions, but without any definite settlement of her boundary disputes with Spain. To strengthen her claim to the territory on the eastern shore of the La Plata, the town of Colonia, opposite Buenos Ayres, was founded in 1679; this was the beginning of a bitter struggle for the present republic of Uruguay, lasting nearly 150 years, until the independence of that territory was formally recognised in 1827 by Dom Pedro I. The discovery of gold in Minas Geraes in 1693, and of diamonds in 1729, gave a new impetus to the growth of the country, one result of which was the removal of the colonial capital from Bahia to Rio de Janeiro. The cultivation of cotton, tobacco, and sugar-cane had already attained great prominence and prosperity in the northern captaincies. The colonial system of Portugal, however, was one of selfish exclusion and greedy extortion. The colony was rigidly closed to foreigners, industry was burdened by restrictions and monopolies, the taxes were farmed out, the authorities were arbitrary and grasping, the administration of justice was slow and corrupt, printing was forbidden, the people were grossly ignorant, turbulent, and immoral, and internal communication was slow and difficult. In 1808 the royal family of Portugal was expelled by the French and took refuge in Brazil, and the very first act of Dom João VI. was to open Brazilian ports to foreign commerce. He then removed various restrictions on domestic industries, founded a printing-office and library, created new courts, and opened various schools and public institutions. All these acts greatly stimulated the growth of the country. In 1821 he returned to Portugal, leaving his eldest son in Brazil as prince-regent. Personal ambition, and the advice of men opposed to government from Lisbon, led the young prince to declare for Brazilian independence, 7th September 1822. He was proclaimed and crowned emperor—as Dom Pedro I.—before the end of the year, the small Portuguese force in the country being quickly and easily expelled. The constitution was ratified and sworn to early in 1825, and some amendments were added in 1835. The new empire, however, did not start smoothly, nor was the reign of Dom Pedro I. a fortunate one. Vexed with the opposition encountered, he in 1831 voluntarily abdicated in

favour of his eldest son, and withdrew to Portugal. During the next nine years Brazil was governed by regencies, but in 1840 a popular agitation led to the declaration of the young prince's majority, at fifteen years of age, and to his coronation the following year as Dom Pedro II. The reign was one of almost unbroken peace, interrupted by two wars—one with Buenos Ayres in 1852, and the other with Paraguay in 1865–70. At the revolution of November 1889, the empire became a republic, and Dom Pedro and his family exiled. The emperor (see PEDRO II.) died in 1891.

See *A Journey in Brazil*, by Professor and Mrs Agassiz (1870); Hartt, *Geology of Brazil* (Boston, 1870); A. R. Wallace, *Travels on the Amazon* (1870); Bates, *The Naturalist on the Amazon* (1873); Mulhall, *Handbook of Brazil* (Buenos Ayres, 1877); Fletcher and Kidder, *Brazil and the Brazilians* (9th ed. Philadelphia, 1879); H. H. Smith, *Brazil, the Amazon, and the Coast* (1880); Selin, *Das Kaiserreich Brasilien* (1882); Zeller, *Die Deutschen im brasilischen Urwald* (1883); Wells, *Three Thousand Miles through Brazil* (1886); and for the history, Southey's *History of Brazil* (1810–19), and the Portuguese works of Costancio and Pereira da Silva.

Brazil Cabbage. CHOU CARABE, are names somewhat vaguely applied to various species of *Caladium* and *Colocasia* (natural order, Araceæ), which yield edible tubers, and are largely cultivated in the tropics. See ARUM, COCCO.

Brazilian Grass, an incorrect popular name applied to a substance used in the manufacture of a very cheap kind of hats, known as Brazilian grass hats, and also as *chip* hats. It consists of stripes of the leaves of a palm, *Chamerops argentea*, which are imported into Britain for this manufacture, and chiefly from Cuba. See CHAMEROPS.

Brazilian Plum. See HOG PLUM.

Brazil Nuts are the seeds of the *Bertholletia excelsa*, a majestic and beautiful tree belonging to the Lecythidaceæ, a sub-order of Myrtaceæ (q.v.).

Brazil Nut :

a, the fruit; *b*, the same, with half the pericarp removed to show the nuts or seeds; *c*, a single nut or seed; *d*, a nut cut across; *e*, a leaf.

The tree grows to the height of 100 or 120 feet, and abounds on the banks of the Orinoco, and in the northern parts of Brazil. It produces a round woody seed-vessel, almost as large as a man's head, within each of the four divisions of which lie six or eight of the seeds. The pericarp is very heavy and solid; and at the time when this great fruit is ready to fall, it is dangerous to walk under the

tree. The seeds, which are popularly called nuts, and much resemble fruits of that description, are wrinkled and triangular, having a hard shell and a pure white kernel, which, when fresh, is very agreeable. They are chiefly exported from Pará and French Guiana, and are well known in our shops. They yield as much as 56 per cent. of oil, which is good for burning. The also much esteemed nuts or seeds of the *Lecythis ollaria*, the Sapucaia or Monkey-pot tree, are produced in a pericarp which resembles a rusty iron pot with a lid, and which is indeed employed as a vessel for many purposes by the Brazilian Indians. *L. bracteata* (*Couropita guianensis*) is the cannon-ball tree; the fruit contains a sweet, fragrant, and refreshing pulp.

Brazil-wood, a dark-red or yellowish-brown dye-wood, which forms a considerable article of export from Brazil. It is the produce of different species of *Cesalpinia* (q.v.). Much of the Brazil-wood of commerce is obtained from the heart-wood of *Cesalpinia brasiliensis*, a native of the West Indies.—**PERNAMBUCO WOOD** is the produce of *C. echinata*, sometimes regarded as the Brazilian form of the preceding species. The timber is called Nicaragua-wood. The Sappan-wood (*C. Sappan*) of the East Indies has similar properties, and is described as an article of European commerce in 1193 under the name of *brasil*, *brasilly*, &c. (cf. Span. *brasil*: Fr. *brésil*, for which Marco Polo has *berzi*). Thus Brazil-wood does not really owe its name to the country of its frequent origin, but the country to its abundance of red dye-woods. *C. cristata* probably yields some of the inferior West Indian Brazil-wood.

The colouring matter is termed *brasilin*; strong decoctions of Brazil-wood are used by the dyer and calico-printer in the fabrication of reds, browns, &c.; it is also used in the manufacture of red ink. See **INK**, **DYESTUFFS**, and **SANDALWOOD (RED)**.

Brazing, or **SOLDERING**, is the process of uniting together two pieces of brass, two pieces of copper, or one of each, by means of a hard solder, partaking more or less of the composition and properties of ordinary *brass*. The edges or parts of metal to be joined are first filed bright, so as to be thoroughly clean, then there is strewn over the joint a mixture of the solder and borax. The solder employed varies in composition according to the kind of work, and may be rendered more fusible by the addition of a larger amount of zinc. Hard solder, or 'spelter solder,' for brass consists of 1 part of copper to 1 of zinc; for copper or iron it is usually 1 part of copper to $\frac{2}{3}$ ths of a part of zinc. The proportions, however, vary, 3 of copper to 1 of zinc being about the hardest solder. After the solder is made it is again heated and granulated in a mortar for use. The borax is employed to form a glaze over the brightened surfaces, and thus prevent the oxidation of the metal, which would seriously interfere with brazing, and even stop the operation. An outward coating or layer of charcoal is likewise serviceable in the exclusion of the air during the brazing of large pieces of metal. Where a very high heat is required in the process, a little powdered glass is mixed with the borax. The mixture of solder and borax may be applied dry, but it is better to moisten it with water, and to lay it on the filed surfaces with a spoon. The whole is then gently heated, when the water evaporates and leaves a crust of borax and solder. The work may now be strongly heated by a bellows, blowpipe, or over a clear charcoal or coke fire, and at a bright red heat the solder fuses and the zinc begins to burn with a pale-blue flame. At this stage the solder *fluxes* or becomes liquid enough to permeate the joint or

crevice; but should it be tardy in acting thus, several slight taps will insure the proper result. The whole is now cooled, and, towards the close, the articles may be introduced into cold water for more rapid reduction in temperature. Pieces of metal which have undergone the process of brazing are so firmly united that they may be rolled and re-rolled without the parts yielding. Steel is brazed with a solder composed of 19 parts silver, 1 of copper, and 1 of brass. See **SOLDER**.

Brazos, formerly **BRAZOS DE DIOS**, a river of Texas, U.S., rising in a tableland called the Staked Plain, in the NW. of the state, and running 950 miles south-eastward, till it falls into the Gulf of Mexico about 40 miles SW. of Galveston. It is navigable at all times to a distance of 40 miles from its mouth, and at high-water for 250 miles.

Brazza, the largest and most populous of the Dalmatian islands of the Adriatic, with an area of 152 sq. m., and a pop. of 22,650 (Croats). Its surface is mountainous, attaining 2578 feet, and richly wooded; excellent marble is quarried. San Pietro is the chief town.

Brazza, **PIERRE SAVORGNA DE**, a French explorer, of Italian descent, was born at Rome in 1852. He studied at Paris, entered the French navy in 1870, and served on the Gaboon station. In 1876-78 he made a famous exploration of the Ogoway, and of some of the northern tributaries of the Congo. In 1878 the French government gave him 100,000 francs for exploration and the promotion of French interests in the country north of the Congo, where he secured vast grants of land for France, and founded several stations, that called Brazzaville being on the northern shore of Stanley Pool. In 1883 he again returned to extend the territory secured to France, this time with a government grant of 1,275,000 francs, besides stores and provisions of all kinds; and by the end of 1885 he had established twenty-six stations, Franceville being the chief. The securing for France of her great dependency lying between the Gaboon and the Congo is mainly his work; and of that dependency he was made governor in 1886.

Breach, in a military sense, is a gap or opening in any of the defences of a fortress, effected either by mining or by the fire of guns placed in what are called 'breaching-batteries.' The high earthen ramparts of all fortresses are surrounded by deep ditches. In order to support the weight of the rampart, and make the ditch a more formidable obstacle, its sides are built up with retaining walls of masonry, technically called 'revetments,' often 30 feet high and 15 feet thick at the foot. To breach by mining, the explosives are lodged at the back of the revetment and near its foot under the parapet in sufficient quantities to bring down the greater part of the whole bank of earth and retaining wall. The debris falling into the ditch forms a rump or slope, upon which the assaulting party rush into the fortress. At the same time the wall retaining the far side of the ditch, called the 'counterscarp,' is treated in a similar manner to facilitate the descent into the ditch. The same result may be obtained by artillery fire. Heavy howitzers are placed in batteries about 1000 yards from the 'escarp' or revetment of the rampart, upon which they drop shell, at an angle of descent of about 14°, crumpling it away from the top downwards, until a practical breach 20 or 40 yards wide is made. During the Peninsular war there were some formidable examples of breaching. At Badajoz, 14,000 shot brought down 180 feet of wall in 104 hours, from a distance of 450 yards. At St Sebastian, 13,000 shot brought down 100 feet of wall in 62 days, from a distance of 620 yards. It was then calculated that 10,000 24-lb. shot, or

240,000 lb. of iron, would breach 100 feet of wall of average dimensions from a distance of 500 yards. But improvements in modern artillery have greatly reduced these figures: thus, at the siege of Strasburg in 1870, 1000 rounds from a 60-pounder gun brought down 30 yards of a wall 15 feet high from a battery 870 yards distant. See SIEGE.

Breach is a legal term used in England and Scotland to denote the violation of a legal right or obligation. The most common form of this is Breach of Contract. A contract may be broken by simple failure to pay or to perform, or by the debtor making it impossible for him to perform before the time arrives, or by his seriously declaring that he will not perform. In some cases the creditor has a right to specific implement—i.e. an order by the court on the other party to do what he promised to do; but in most cases the remedy is an action of damages for breach of contract; and difficult questions arise as to the proper measure of damages. In an ordinary mercantile sale, for instance, if the seller fails to deliver, the buyer must go into the market within a reasonable time to supply himself. On the other hand, if the buyer breaks the contract, the seller should dispose of the goods as soon as possible, and charge the difference of market and contract price. Breach of Trust consists in the violation of the express or implied obligations of a trustee—e.g. making an investment of trust funds not sanctioned by the trust deed, or using trust funds in the business of the trustee. The liability so incurred is generally to replace the funds, sometimes with penal interest. Such acts are often restrained by interdict or injunction at the instance of the beneficiaries. Breach of trust often takes a criminal complexion, and is punished as embezzlement. Breaches of contract are very rarely criminal—indeed only where the element of conspiracy occurs. Breach of the Peace includes a great variety of criminal acts, from mobbing and rioting down to small police offences. In England, Breach of Close is a technical expression for trespass on private ground; Breach of Pound is the offence of breaking open the place where distrained goods are placed for custody with a view to sale. In Scotland, Breach of Arrestment means the disregard of the prohibition to pay or deliver, which is effected by the use of arrestment in the hands of a debtor; it involves only civil consequences—viz. the liability to pay or deliver a second time. Breach of Interdict, on the other hand, is regarded as a more serious contempt of court, and is often severely punished criminally. See CONTRACT, DAMAGES, TRUST, WARRANTY; and for Breach of Promise of Marriage, see MARRIAGE.

Breaching Tower, or **BEFFROI**, was the name of a tower used in the military sieges of ancient and medieval times. When a town was to be besieged, a movable tower, as high as the walls, was brought near it; and this tower was the beffroi. Its use is more than once spoken of by Caesar in his account of his campaigns in Gaul. Froissart describes, with his usual spirit, a beffroi employed at the siege of the castle of Bretenil in 1356. At the siege of Jerusalem by the Crusaders, a beffroi was carried in pieces, put together just beyond bow-shot, and then pushed on wheels to a proper position. Sometimes they were pushed on by pressure, sometimes by capstans and ropes. The highest were on six or eight wheels, and had as many as twelve or fifteen stories or stages; but it was usual to limit the height to three or four stages. They were often covered with raw hides to protect them from the flames of boiling grease and oil directed against them by the besieged; and there was a

hinged drawbridge at the top to let down upon the parapet of the wall to aid in landing. The lower stage frequently had a ram (see BATTERING-RAM); while the others were crowded with bowmen and slingers; or there were bowmen on all the stages except the top, which had a storming or boarding party. The *locus classicus* for a description of such military engines is this from Lord Berners' *Froissart*, l. cix. 131: 'Two belfries of great timber, with iii. stages, every belfry on four great wheels, and the sides towards the town, were covered with cure holy [Fr. *cuir bouilli*] to defend them from fire and from shot; and into every stage there were 'pointed C. archers.' The engine was also called a *sour*.

Bread. The earliest and most primitive way of making bread was to soak the grain in water, subject it to pressure, and then dry it by natural or artificial heat. An improvement upon this was to pound or *bray* the grain in a mortar, or between two flat stones, before moistening and heating. A rather more elaborate bruising or grinding of the grain leads to such simple forms of bread as the *out-cakes* of Scotland, which are prepared by moistening oatmeal (coarsely ground oats) with water containing some common salt, kneading with the hands upon a baking-board, rolling the mass into a thin sheet, and ultimately heating before a good fire, or on an iron plate called a girdle, which is suspended above the fire. In a similar manner, the barley-meal and pease-meal *bannocks* of Scotland are prepared; and in the East Indies (especially the Punjab and Afghanistan), as well as in Scotland, flour is kneaded with water, and rolled into thin sheets, as *scones* (although this term is usually applied to bread lightened with butter-milk and baking-soda.) The *passover cakes* of the Israelites were also prepared in this way. A similar preparation of wheat-flour, but where the sheet of dough is made much thicker, forms the *dampers* of Australia. The Indian corn-meal, kneaded with water and fired, affords the *corn-bread* of America. The kinds of bread referred to above are designated *unleavened*, as no leaven has been added to the dough to excite fermentation. No chemical change has therefore been produced except that the starch has been rendered more soluble by the process of baking. Even in the time of Moses, however, *leaven* was employed in making bread. It is held probable that the Egyptians were the first to use leaven; that the secret afterwards became known to the Greeks; and that the Greeks communicated the process to the Romans, who spread the invention far and wide in the northern countries during their campaigns.

The grain of wheat is generally employed in the manufacture of bread among the better classes and more advanced nations, though rye, barley, Indian corn, and rice are also extensively used. The average composition of the grain of wheat is:

Moisture.....	14.0
Mineral matter.....	1.8
Albuminous bodies (soluble in alcohol)...	7.2
Nitrogenous matter (insoluble in alcohol)...	4.5
Sugar.....	2.2
Cellulose.....	3.0
Starch.....	65.8
Fat.....	1.5
Total.....	100.0

The proportion of these ingredients, however, varies considerably. Much depends on soil and climate. Taken as a general rule, to which there are exceptions, the wheat becomes more starchy as we proceed southwards. The *strongest* foreign flours (i.e. those richest in gluten) are grown in Minnesota, Manitoba, Hungary, and Russia. Indian wheat usually furnishes a *weak* flour. The principal constituents of wheat may be separated from each other without much difficulty. Thus, if wheat-

flour be placed in a cloth-bag with the mouth well closed, and the whole introduced into a basin of water, and pressed by the fingers for some time, the starch is squeezed through the cloth as a fine white powder, and the gluten is left in the cloth as a viscid or sticky substance. Again, if wheat-flour be burned on a porcelain plate on a fire, or oven, or gas-lamp, till it can burn no longer, it leaves behind a small amount of ash or saline matter.

Previous to being employed in the fabrication of bread, the grain of wheat undergoes the process of *milling*, with the double object of reducing it to a fine state of division, and separating the more hard and indigestible parts (see *MILL*). During the grinding operations, the wheat as it passes from grain to flour nearly doubles its bulk. The products come from the dressing-machine divided into different qualities, a quarter of wheat yielding by some systems of milling:

In the making of bread in Great Britain, the flours are blended by the baker so as to produce bread of desired quality. In the making of good bread three things are absolutely requisite: flour or meal, yeast or leaven, and water containing salt. The Yeast (q.v.) or leaven is added to give a start to the Fermentation (q.v.) process, thereby supplying carbonic acid, which communicates a spongy or light texture to the bread. Leaven is the more primitive ferment, and is simply a portion of moistened flour or dough in which the putrefactive agencies have begun to work. It may be procured by allowing moistened flour to lie in a warm apartment (summer heat) for six or eight days, and when sufficiently formed, has an acid taste and reaction, and a somewhat fusty odour. When brought in contact with a new portion of flour and water, and incorporated therewith by kneading, it very quickly acts as a ferment, and develops partial fermentation in the whole. Hence it is that where leaven is used, it is customary to retain a portion of the leavened dough for the next baking. On the Continent, leaven is still very extensively employed, especially in districts far from breweries. In Britain, yeast is generally used as the ferment. There are three forms in common use—viz. 'brewers' yeast,' 'German compressed,' and 'patent.'

The materials being at hand, and the proper benches, utensils, and oven being within reach, the baker takes a quantity of water and adds to it the yeast and salt; after which the flour is added, and the whole thoroughly and laboriously kneaded together till it assumes a rosy consistence. It is then called the *sponge*, and is placed in a kneading-trough in a warm place, which is styled *setting the sponge*. In a short time, the yeast begins to act on the gluten, starch, and sugar of the flour, compelling the latter to pass into alcohol and carbonic acid gas in every part of the dough, which thereby becomes inflated with innumerable air cavities. When the fermentation has sufficiently advanced, the baker takes the sponge, adds more flour, water, and salt, a second time subjects the whole to a thorough process of kneading, and makes it into dough, after which he allows the mass to lie in a warm place for from one to two hours. The dough swells considerably from distension by gas, and is weighed out into lumps of the proper size, which are shaped into loaves, constituting the *batch*, or placed in tin pans, and allowed to lie for a short time till they get further distended. The oven has previously been heated to a

temperature of at least 450° F., which is the lowest temperature at which bread can be baked, and ranging up to 572° F.; when it has been thoroughly cleaned out, the loaves are introduced, and the oven shut up. Until recent years bakers had not improved upon the method used in the bakeries of Pompeii—viz. by burning wood in the floor of the oven itself until the proper temperature had been reached, then cleaning out and introducing the loaves. Latterly, however, this somewhat inconvenient method has been improved upon, and many large bakeries are fitted with ovens heated either by flues, gas (regenerator), or superheated steam. The heat acts in dissipating much of the water from the dough, in distending the air cavities more fully, and in partially *boiling* the starch and gluten of the dough, and developing some gum from the starch. Indeed, though the temperature of the oven is much higher, yet the loaves beyond the mere crust are bathed in an atmosphere of steam, and are never heated above 215° F., as has been proved by direct experiments with the thermometer. One effect of the heat is to arrest any further Fermentation (q.v.; see also YEAST). After about one and a half hours' baking in the oven, the length of time being determined by the temperature, the loaves are withdrawn, and allowed to cool. The brown appearance of the crust of loaves, and the pleasant taste of the crusts, are due to the action of the heat on the starch and the formation of Dextrin (q.v.), a sort of gum. The number of quarters (4-lb.) loaves which a sack of flour weighing 280 lb. yields, is from 86 to 96 according to the strength of the flour. It will be apparent, therefore, that as 280 lb. of flour yield on an average 360 lb. of bread, a good deal more water must be present in the latter than in the former; and, indeed, ordinary good wheaten bread contains about 45 per cent. of water. This water is retained even after the loaf is apparently dry, and even mealy, as the gum and gluten have a great affinity for water.

Machinery has now superseded manual labour in many of the operations of bread-making. In a few of the largest bakeries the flours obtained from various sources are blended by passing through a sifting-machine, and are thence conveyed by a strap or endless screw to large bins. From these bins, when Parisian barm or brewers' yeast is used, the flour is drawn off into barrels or troughs in which the sponge has to be stirred. The stirring is usually performed by means of a vertical spindle provided with horizontal blades, which is made to revolve in a barrel or trough. At the proper time the sponge is emptied into a kneading-machine, the remainder of the water and salt is added, and a quantity of flour is drawn off from the bins sufficient to make the mass of the desired consistency. The whole is now thoroughly mixed into dough. This operation is completed in from five to ten minutes in batches which will turn out from one hundred to five hundred loaves. There are several kinds of kneading-machines in the market, but the two most commonly used are the 'Thomson' and the 'Pfleiderer' machines. They consist essentially of an iron trough provided with blades revolving in opposite directions. In the 'Thomson' machine the blades revolve upon the same axis, while those of the 'Pfleiderer' revolve upon different axes. As soon as the dough is thoroughly made, it is emptied into troughs, where it remains for an hour or two. It is then conveyed to a table and weighed out, and afterwards moulded into loaves as already detailed. There have been several attempts to make machines to divide and mould the dough into loaves, but these have not yet been perfected.

The baking business is chiefly carried on in shops

of moderate dimensions, in which on an average perhaps twenty bags of flour are used per week, but in many large cities the factory system has been introduced. Some of these are on a very large scale, using 1000 to 2000 bags every week. From the nature of the industry, operations are principally carried on at night or early morning. In England till recently almost every family in the country baked its own bread, but the Scottish custom is gradually creeping in, of getting supplied by a baker from a neighbouring town.

The appearance which good wheaten bread ought to present is that of a vesicular or spongy mass, from which layers can be readily detached; and this, known to bakers as *piled bread*, is the best index of good, wholesome, and easily digested bread. When the layers cannot be detached, and the loaf cannot be crumbled down by the fingers into a coarse powder, or the fragments be thoroughly soaked and be readily diffused through water, but become a permanent tough mass of dough, the bread is imperfectly made.

Rye-bread is very extensively used in northern European countries, where the soil being sandy is admirably adapted for the growth of that grain. It yields a flour darker than wheat-flour. It is almost equal in nutritive value to wheaten bread. Barley and oats, which, when used as bread, are generally made into cakes or bannocks, possess also a composition not unlike wheat. Indian corn, which thrives luxuriantly on the American soil, and is largely used there for bread, as also to a considerable extent in the Old World, is little different from wheat in the proportion of its ingredients. Rice is occasionally employed in making bread, but it is not nearly so nutritious as wheat.

But although, with the exception of rice, the various kinds of grain do not sensibly differ in the amount of nutritious matter contained in the meal, yet there is a great difference as to the quality of yielding a light, spongy bread. In this respect the flour of wheat excels all others. This quality seems to depend upon the mechanical structure of the gluten of wheat, which gives a glutinous, sticky consistency to the dough, rendering it impervious to the carbonic acid gas formed in it during the fermentation, so that the gas thus imprisoned swells it up. The meal of other grains forms a more granular and less tenacious dough, which allows the gas to escape with more or less ease as it is formed. It is thus impossible to make a light spongy loaf of oatmeal, however finely it might be ground. In the case of whole-meal bread, or brown bread, the rough, hard particles of the bran interfere with the ordinary tenacious quality of wheaten flour, and make the dough slightly porous, so that much of the gas escapes, and thus this kind of bread is never so much raised as bread of fine flour.

Instead of raising the dough by the action of yeast, which decomposes a part of the flour and causes the loss of about 2 per cent., bicarbonate of soda and hydrochloric acid, or bicarbonate of soda and tartaric acid, are sometimes employed. The proportions by this process are 4 lb. of flour intimately mixed with 320 grains of bicarbonate of soda; to this is added a mixture of 35 ounces of water and 6½ fluid drachms of hydrochloric acid, sp. gr. 1.16, or 320 grains of bicarbonate, and 160 grains of tartaric acid, and the whole is kneaded and placed in the oven. When the mixture is made, the acid acts on the bicarbonate of soda, forming common salt, which is left in the dough, and carbonic acid is liberated at every point, and communicates a spongy texture to the mass. This process is chiefly used in making *whole-meal bread*, as the usual fermentation process would cause too much change in the bran, and produce a bread liable

to sour by secondary fermentation. It is also employed in making 'fancy' and 'small bread.' Sesquicarbonate of ammonia is employed to some extent in the preparation of rusks, ginger-bread, and other light fancy bread; when heated, it entirely passes into gas, and thus yields a very spongy mass. *Short-bread* is prepared from flour with which butter has been incorporated.

Brown, Composition, or Whole-flour Bread is made from the ground but undressed wheat, and therefore contains the bran as well as the flour. Some years ago it was suggested that as the bran contained more nitrogenous matter than the flour, the whole meal must be more nutritious than the finer flour alone. But that opinion is now considerably modified. The great argument in favour of the use of whole-meal bread is that it contains more nitrogen than white bread. This is perfectly true, but as was pointed out by Wigner, the nitrogen of cereals exists in two forms—viz. the coagulable and the non-coagulable albuminoids, the former being those available for the purposes of nutrition, whilst the latter are almost useless for the purposes of food, consisting of alkaloids and salts of nitrogen. The fine portion of the flour was found by him to contain the nitrogen in the first condition, whilst the bran contained the comparatively useless form of nitrogen. A strong argument against the use of whole-meal bread is that the gritty particles which are present in the bran cause an unnatural irritation in the alimentary canal, and lead to a quicker evacuation of the but partially digested and absorbed food. This explains why brown bread possesses laxative properties, and why labourers fed on it consider that it makes them hungry soon again; they feel that it does not last in the stomach, and consequently think it has little nourishment in it.

The Act of 1836 prescribes that bread, except French rolls and fancy bread, must be sold by weight only; and the Factory and Workshops Act of 1878 regulates the condition of bakehouses. See also BISCUIT, CEREALIA, COOKERY, DIET, DIGESTION, FOOD, MILL, WHEAT.

AERATED BREAD is prepared by a process patented by Dr Daughlish in March 1859, and was at one time very popular, but its use is now almost exclusively confined to London and district. The process consists in placing the flour in a strong inclosed iron box, and moistening it with carbonic acid water, prepared as stated under *Aerated Waters* (q.v.). The dough is then worked up by machinery for ten minutes or so inside the box, from which it is dropped into moulds, which form it into loaves. It is then placed in an oven, when the carbonic acid, previously introduced with the water within the dough, expands, and forms a light palatable bread. The advantages claimed for this method of working bread are: (1) There is a saving of the whole of the waste caused by fermentation, which admits of more bread being made out of a sack of flour than by the old process; (2) The process, instead of occupying eight or ten hours, is completed in half an hour; (3) The cost of machinery and gas is less than that of yeast used in the old process; (4) The dough requires no handling to knead it and form it into loaves; (5) The bread is absolutely pure—it is simply flour, water, and salt. Not having undergone the process of fermentation, however, it has not the peculiar sweet flavour that we are accustomed to in ordinary bread, and the palate soon tires of the somewhat rapid taste.

GLUTEN BREAD is a bread prepared in such a way that it contains no starch or sugar, so as to be suitable as a food for diabetic patients. The flour is made into a stiff dough with water, and

allowed to stand for a short time, usually an hour. It is then kneaded under running water so as to separate and wash away the starch. When the wash water ceases to be milky, the remaining gluten is made up into small rolls and baked.

The adulterations of bread are dealt with in the article on ADULTERATION.

Breadalbane. See CAMPBELL.

Bread-fruit Tree (*Artocarpus incisa*), a tree of the sub-order Artocarpaceae of Urticeae (q.v.), a native of the islands of the Pacific Ocean and of the Indian Archipelago, is one of the most important gifts of nature to the inhabitants of these regions, its fruit supplying the principal part of their food, and its inner bark a considerable part of their clothing, whilst its timber and its milky juice are also employed for economical purposes. The genus to which it belongs (Gr. *Artocarpus*, 'bread-fruit')

Bread-fruit (*Artocarpus incisa*).

is distinguished by having the male flowers in catkins, with a two-leaved perianth and one stamen; the female flowers naked; the fruit roundish, fleshy, and tuberculated. The bread-fruit tree is a rather slender tree, 40 to 50 feet high, and often rises almost half its height without a branch. It has large pinnatifid leaves, frequently 12 to 18 inches long, dark-green, and glossy. The fruit is generally oval, or nearly spherical, and about the size of a child's head, and 3 or 4 lb. in weight. It is a *sorosis*, a compound or aggregate fruit formed from numerous flowers on a common axis, and is covered with a roughish rind, which is marked with small square or lozenge-shaped divisions, corresponding to the separate fruitlets; it is at first green; when imperfectly ripened, brown; and when fully ripe, assumes a rich yellow hue. It is attached to the small branches of the tree by a short thick stalk, and hangs either singly or in clusters of two or three together. It contains a somewhat fibrous pulp, which, when ripe, becomes juicy and yellow, but has then a rotten taste. At an earlier stage, when the fruit is gathered for use, the pulp is white and mealy, and of a consistence resembling that of new bread. In a still less mature state, the fruit contains a tenacious white milk. The seedless variety is of course especially fleshy, but the seeds of the normal form are sometimes roasted like chestnuts or used as sources of starch. The common practice in the South Sea Islands is to cut each fruit into three or four pieces, and take out the core; then to place heated stones in the bottom of a hole dug in the earth; to cover them with green leaves, and upon this to place a layer of the fruit,

then stones, leaves, and fruit alternately, till the hole is nearly filled, when leaves and earth to the depth of several inches are spread over all. In rather more than half an hour, the bread-fruit is ready; 'the outsides are, in general, nicely browned, and the inner part presents a white or yellowish cellular pulpy substance, in appearance slightly resembling the crumb of a wheaten loaf.' It has little taste, but is frequently sweetish, and more resembles the plantain than bread made of wheat-flour. It is slightly astringent, and highly nutritious. Sometimes the inhabitants of a district join to make a prodigious oven—a pit 20 or 30 feet in circumference, the stones in which are heated by wood burned in it, and many hundred bread-fruits are thrown in, and cooked at once. Baked in this manner, bread-fruit will keep good for several weeks. Another mode of preserving it is by subjecting it in heaps to a slight degree of fermentation, and beating it into a kind of paste, which although rather sour, is much used when fresh bread-fruit cannot be obtained. There are numerous varieties of the bread-fruit tree in the South Sea Islands, and they ripen at different seasons. The tree produces two and sometimes three crops a year, in fact is bearing during eight or nine months of the year. In the West Indies and South America, into which it has also been introduced, the bread-fruit is valued as an ornamental tree, but has not come much into use as an ordinary article of food; various preparations of it, however, are reckoned delicacies.—The fibrous inner bark of young bread-fruit trees, beaten and prepared, is used for making a kind of cloth, which is much worn by the common people in the South Sea Islands, though inferior in softness and whiteness to that made from the paper mulberry (see MULBERRY, PAPER).—There exudes from the bark of the bread-fruit tree, when punctured, a thick mucilaginous fluid (*latex*), which hardens by exposure to the air, and is used, when boiled with cocoa-nut oil, for making the seams of canoes, pails, &c. water-tight, and as birdlime.—The timber is soft and light, of a rich yellow colour, and assumes, when exposed to air, the appearance of mahogany. It is used for canoes, housebuilding, furniture, and many other purposes. It is durable when not exposed to the weather. The leaves serve for wrapping articles of food, and the fallen male catkins furnish a convenient source of tinder.—The Jack Tree or Jaca (*A. integrifolia*) is a large and very thick tree, a native of the East Indies, but cultivated also in the Antilles, with large entire leaves and much larger fruits (up to 25 lb.), of which some varieties are as eatable as those of the commoner species. The mahogany-like timber is known as jacqueira-wood, and is used both in building and furniture. The sap yields a kind of dammar, and is also a source of caoutchouc. *A. hirsuta* (Malabar) yields paper from its bast.

Bread-nut, the fruit of *Brosimum alicastrum*, a native of Jamaica, an artocarpaceous tree closely allied to the bread-fruit. The bread-nut tree is diccious, with ovate-lanceolate evergreen leaves, and abounds in a tenacious gummy milk. Its leaves and young shoots are much eaten by cattle, but deleterious qualities are said to be developed in them as they become old. The fruit is a one-seeded drupe, and the kernels, boiled or roasted, form an agreeable article of food, and are eaten instead of bread. Their taste resembles that of hazel-nuts.—The *Pulo de Vau*, or Cow-tree (q.v.), of Demerara is often referred to the same genus.—*B. aubletii* of British Guiana and Trinidad yields heartwood of a rich deep mottled brown, hence called letterwood, snakewood, or leopardwood. It is chiefly used for veneering.

Bread-root. See YAM and PSORALEA.

Breadth is a term used by painters and critics to indicate that artistic quality which gives concentration, repose, and harmony of effect to a picture. In a work distinguished by breadth, the individual component parts do not force themselves unduly upon the spectator, the eye is not tempted to wander aimlessly from point to point of the canvas; in such a picture we do not feel inclined to count the several bricks of the artistic structure, but we are led to admire the general proportion and total effect of the building. Breadth of effect is most commonly and readily attained by massing the shadows, and skilfully leading the eye through the half-tones to the brilliant concentration of the highest lights; and of this mode of treatment the portraits and figure-pieces of Rembrandt are typical and unsurpassable examples. The introduction of the triangular spaces of shadow, which appear so frequently in the foreground of Waterloo's etchings, and in the landscape work of his contemporaries, is a well-known conventional and mechanical device for securing breadth of effect. Breadth, however, may—in the hands of an accomplished painter—he attained more subtly when the greater part of the canvas is kept in full sunshine and the spaces of shadow minimised (instead of the points of light, as in the practice of Rembrandt above referred to); and of this method of attaining breadth the most perfect examples that art has yet presented are the later landscapes of Turner. The term 'breadth of handling,' or 'a broad touch,' is used to express certain characteristics of manipulation, to designate the practice of a painter who works with a full brush, and aims less at minute and searching expression of detail than at truth and beauty of general tone, effect, and relation.

Bread-tree. See KAFFIR BREAD, CYCADACEÆ.

Breaking Bulk, in Scots law, signifies making use of an article supplied in bulk, or in quantity; by which act one is said to break bulk, and is, in consequence, prevented from afterwards objecting to it, and returning it to the seller. It may be necessary to apply for judicial inspection before doing this, or at least to give notice to the carrier or to the seller. See SALE OF GOODS.

Breaking Inclosures, the technical name of an old statutory offence in Scotland, which consisted of injuring plantations or breaking their inclosures. Special punishments were provided for the purpose of favouring planting and inclosing in the 17th century. This would now be punished as malicious mischief. See PLANTATION.

Breakspear. See ADRIAN.

Breakwater is a barrier intended for the protection of shipping in harbours or anchorages. It sometimes happens that, in front of a semi-circular bay, a small island is so situated as to form a natural breakwater. This is to some extent the case with the Isle of Wight, which occupies such a position as to protect Portsmouth and Southampton from the south. In many other places, however, bays and harbours are without such screens. A pier may be so placed and constructed as to serve also the purpose of a breakwater, but the term breakwater is generally confined to a structure used solely for protection, and not for berthing or traffic, and breakwaters are frequently insulated, so as to be cut off from any communication with the shore unless by water.

Plymouth Breakwater is the best known of these engineering works. The sound or harbour, being open to the south, was so much exposed to storms that, early in the present century, it was determined to construct a breakwater across its mouth, with openings between it and the shore, on either side, for the ingress and egress of ship-

ping. The works were commenced in 1812, from designs by Rennie, and were estimated to cost £900,000. The operations consisted in transporting along a tram-road large blocks of limestone got from a neighbouring quarry, shipping them in vessels fitted with trap-doors, and by means of these depositing them in the shape of a huge mound in the required situation. The design was to carry the rubble mound to a height of 10 feet above low-water, to give the seaward face a slope of 3 to 1, and the inner face $1\frac{1}{2}$ to 1, and the width on top 30 feet. As soon as the stones began to appear above water, a perceptible benefit resulted in the relative calmness of the sound during the prevalence of storms; but the structure was frequently very roughly handled by the waves, which altered and flattened its shape. A severe storm in November 1824 overthrew a length of 796 yards of the finished work; after this the breakwater was raised 10 feet higher, the seaward slope made 5 to 1, and the top width 45 feet, the top and slopes paved with masonry, and the top protected with expensively dressed granite blocks, joggled together and bedded with cement. It was not until 1841 that the works were finally completed, by the deposit of more than 3,000,000 tons of stone, and the expenditure of nearly £1,500,000. The breakwater is nearly a mile long, the central portion is 1000 yards; and two wings, of 350 yards each, extend from the ends of this at a slight angle. The open channels at each end, between the breakwater and the shore, are each about half a mile wide, and their depth is respectively 40 and 22 feet at low-water. The breakwater is 400 feet wide at the base, and 45 at the top—the two sides being made very sloping for the security of the stones. The slopes and top are faced with masonry. The water-space protected by this breakwater comprises 1120 acres, and it is generally admitted that the money has been well spent on the work. The breakwater requires constant repair; the sum voted in some years exceeds £2500.

Holyhead Breakwater was designed by Mr Rendel for the purpose of converting Holyhead Bay into a harbour of refuge. It is formed of stone quarried from Holyhead Mountain, the stone being run out upon a timber staging and dropped into the sea. This mode of construction was first adopted at this work, and it permits the stone being deposited in rough weather, when it would not have been safe to use barges. The rubble reached up to the level of high-water, and has assumed a seaward slope of 1 in 12; the inner slope is $1\frac{1}{4}$ to 1. A vertical wall, 20 feet thick, is founded in the rubble at low-water level and carried up to 40 feet above that level; the width of roadway inside is 40 feet. The breakwater shelters an outer roadstead of 400 acres, with a depth of from about 20 to 50 feet, and an inner harbour of 267 acres, with a depth of 3 to 7 fathoms. It was originally contemplated to inclose the area by two breakwaters—a north one 5360 feet long, and an east one 2000 feet in length. The east breakwater was, however, abandoned, and the north breakwater lengthened to 7860 feet. The original estimate was £1,400,000. The stone for the breakwater was obtained by enormous blasts: one of the mines exploded on 21st May 1857 contained 21,000 lb. of gunpowder, which displaced 130,000 tons of stone. On Mr Rendel's death the completion of the work was intrusted to Sir John Hawkshaw, who completed the head, which was founded by divers at a depth of 20 feet under low-water, and carries a lighthouse rising to the height of 70 feet above high-water. The cost of the breakwater has been £163, 10s. per lineal foot. The work was begun in 1847 and finished in 1873.

Portland Breakwater is of very great value,

in converting into a harbour of refuge the expanse of water between the Dorsetshire coast and the Isle, or rather peninsula, of Portland.

Plan of Portland Breakwater.

An act of parliament was obtained in 1847, authorising the works, which were begun in 1849. The breakwater, starting from the north-east point to the isle, stretches nearly due north for more than 2 miles, with one or two intervening openings for the ingress and egress of shipping. The works are of the same engineering character as Holyhead, but were conducted more easily than those of any other great breakwater; for the isle contains an abundance of stone easily quarried, and the steep shores afforded facility for transporting the stones by their own gravity to their destination. The work, finished in 1872, is for the most part a rough rubble stone bank, surmounted by vertical walls from the low-water level; the depth is about 50 feet at low-water. From the nature of the operation, any part of the breakwater became useful as soon as constructed, increasing the safety of Portland Bay as a harbour of refuge.

A battery constructed of iron and mounted with heavy ordnance has been erected on the extreme end of the outer breakwater, and another has been placed on the end of the inner breakwater, while formidable batteries have been erected on shore.

Dover Breakwater has been chiefly useful as the French mail-packet station. There is no stone near to form a mound, as in the other breakwaters spoken of, and, in consequence, the work has been brought up in solid ashlar from the bottom by the diving-bell, with the interior formed of blocks of concrete. In 1891 a bill was passed for extending the commercial harbour, and the memorial stone was laid by the Prince of Wales in 1893. The work includes an extension of the Admiralty Pier 580 feet in length, with another new east pier, and enclosing an area of 75 acres. It is expected to be completed in 1901. Meanwhile, works for a further extension in the form of a National Harbour of Refuge were commenced in the beginning of 1898. These consist of a further extension of the Admiralty Pier of 2000 feet, an east arm extending 3320 feet, and a breakwater 4200 feet long, at a distance of three-quarters of a mile from the shore, to form the sheltering arm of the harbour on the south. The area enclosed, including the commercial harbour, will be 685 acres; the cost is estimated at £3,500,000, and the whole is to be completed in 1908.

Alderney Breakwater was designed for the government by the late James Walker in 1847. The situation is fully exposed, and the depth of water at its extremity is 130 feet. This breakwater consists of a rubble mound, with walls above founded 12 feet under low-water. The work was completed in 1864, but has been at various times seriously damaged. Up to now the cost of repairs was nearly £150,000; the total cost of the structure has been £1,327,050. The length of breakwater is 4500 feet; but the outer portion has been abandoned on account of the difficulty of maintaining it.

Small breakwaters have been constructed at Cette near Marseilles, at the mouth of the Delaware in the United States, and at Buffalo in Lake Erie; but they do not call for description.

Cherbourg Breakwater is the greatest and the most costly ever constructed. More than 100 years ago, M. de Cessart proposed to the French government the formation of a breakwater at Cherbourg, to be commenced by the construction of a number of hollow cones formed of timber-framing, sunk in a line as close as they could be placed to each other, and then filled with stones. These cones, of which there were to be 64, each about 70 feet high, 150 feet in diameter at the base, and 60 feet at the top, were intended to form a nucleus to the stone breakwater, to prevent the stones, during its formation, being knocked about and too much spread out by the action of the waves. In 1784-88, 16 cones were constructed, and 13 of them sunk; but so great was the destruction which they underwent during stormy weather, that the government at length abandoned the plan, and carried on the stone breakwater without the aid of the cones. It was completed under Napoleon III. at a cost

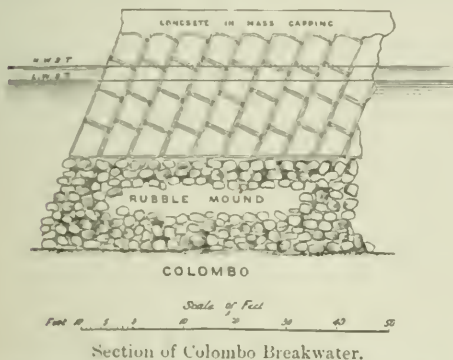

BREAKWATERS.—SECTIONS.

exceeding £2,500,000. The breakwater itself was finished in 1853, but since that year large fortifications have been built upon the upper works. The length is nearly $2\frac{1}{2}$ miles; the breakwater is 300 feet wide at the bottom, and 31 at the top. The chief mass consists of rubble or unshaped stones, thrown down from ships; but there is a larger ratio of wrought and finished masonry than in the Plymouth Breakwater, consisting of granite blocks imbedded in cement. The depth of water is about

60 feet at low-water spring-tides; and the breakwater rises to 12 feet above high-water level. The water-space included within and protected by the breakwater is about 2000 acres, but two-thirds of this has scarcely depth enough for the largest sized ships. The relation which this breakwater bears to the vast military and naval arrangements of the place will be noticed under CHERBOURG.

Concrete Breakwaters.—The introduction of concrete made from Portland cement has in recent years greatly modified and simplified the construction of breakwaters. The cement is mixed with sand, gravel, and broken stone in various proportions according to exposure; 1 of cement to 7 of other materials being a common proportion for breakwaters. Sometimes the concrete is made into large blocks on shore and deposited under low-water. On the other hand, it may be lowered down, inclosed in large bags; or it may be lowered down in boxes, with hinged bottoms, and deposited in

Section of Colombo Breakwater.

mass on the bottom, either within timber casing, or even without any protection at all. The south breakwater of Aberdeen is formed of large blocks from the bottom up to 4 feet above low-water, and above that level of concrete in mass formed within temporary casing. The Colombo Breakwater is composed of a mound of rubble brought up to 24 feet under low-water, and above that level of concrete blocks weighing 35 tons each set on edge. Sometimes breakwaters are made by first depositing large concrete blocks of 20 to 50 tons in weight, in *pierres perdues* style from the bottom up to a little above low-water, and then forming a monolithic mass of concrete above, such as the breakwater at St Jean de Luz. The breakwater in Peterhead Bay (part of the great harbour of refuge, begun in 1886), is in the Colombo style, and is being made by aid of convict labour. The breakwater at Fraserburgh, begun in 1878 and finished in 1882, is constructed of Portland cement concrete; the lower portion is formed of fifty-ton bags dropped from a barge on the system adopted first by Mr Cay at Aberdeen. The result at Aberdeen has not been favourable to the bag-work system for exposed situations, serious damage having been sustained by the works. Mr Abernethy reported to the trustees that a sum of £11,000 would be required to repair the work and make the structure safe. The bag-work has had to be protected at some parts by large concrete blocks deposited in front of them.

Many substitutes have been proposed for solid breakwaters, such as floating breakwaters constructed of timber framework, open iron screens, &c., but none of them have been shown to be suitable for actual practice. Close timber-work, filled in with stones, is found to be quite efficacious; but on most of our coasts the timber is liable to be eaten by the marine worm, which is an almost

insuperable objection to its being used under water. See HARBOUR.

Bream, a popular name applied to three very different kinds of fish, but especially to the first mentioned. (1) The Fresh-water Bream (*Abramis brama*), a common little fish nearly allied to the Bleak (q.v.). It has an elongated, laterally compressed body, a short blunt snout, and long anal fins. The colour varies from silver gray to brown. It may measure over a foot, and usually weighs between two and four pounds, though often more. The bream is frequent in North Europe, including England and Ireland, and lives in great shoals, in quiet waters. They are shy in habit, hardy in constitution, and very prolific. Fresh-water plants, such as Isoetes, form the favourite diet. At the breeding-time the males become adorned with numerous whitish knobs, which become amber-coloured; as many as four are said to follow the spawning female. The flesh is esteemed, especially on the Continent. The White Bream (*A. blicca*) is another common species, also British, but its flesh is not eaten, or at any rate not liked.

(2) Quite distinct from these is the large family of Sea-breams or *Sparidae*, in the Acanthopterygii division of bony fishes. They have compressed oblong bodies, one dorsal fin, with approximately equal soft and spinous portions, with the lower rays of the pectorals usually branched, with thoracic ventrals. They are especially characterised, however, by the nature of their dentition. Anterior cutting teeth, or lateral molars, or both, sometimes plus anterior conical canines, are present, and the palate is usually toothless. The family is a large one, with 30 genera and about 160 species, occurring abundantly along the coasts of tropical and temperate seas. They feed on flesh or algae, and are for the most part fit for eating. The solitary Black Sea-bream or Old Wife (*Cantharus lineatus*), the Common Sea-bream (*Pagellus centrodontus*), caught in great numbers with the seine net, the Mediterranean Gilthead (*Chrysophrys aurata*), and many

Common Sea-bream (*Pagellus centrodontus*).

others, occur in varying abundance on Southern British coasts. Box, Sargus, and Pagrus are allied genera. (3) The term Bream is also applied to *Brama raii* (q.v.), a widely distributed fish of the mackerel family.

Breastplate, in ancient armour, was a plate of iron, steel, or other metal, so fastened as to protect the chest of the wearer. The backplate, in like manner, protected him from attack from behind. The two together form what is now called the *cuirass*, worn by the *cuirassiers* of European armies, and by the household cavalry (Life-guards and Horse-guards) in England. See ARMOUR.

Breasts, or mammary glands, are the organs which secrete milk for the nourishment of the young in the Mammalia, and from the presence of which that class of animals takes its name. In the human subject they are two in number, situated on the front of the chest. In very exceptional cases additional glands are found, sometimes in remote situations. In children they are small and rudi-

mentary, but about the age of puberty they enlarge. In boys this enlargement, if it occurs, passes off after a few days, and the breasts remain rudimentary during the rest of life; but in girls it leads to the full development of the organ. Over the centre of the gland there is a circular patch of skin, thinner and darker than the rest (the *areola*); and from it rises a small conical projection (the *nipple*). On the apex of the nipple the *milk-ducts* (15 to 20 in number) open by separate orifices. Each of these ducts passes outwards to one division or *lobe* of the breast, dilating beyond the nipple into a *sinus*, and

Breast, showing the lower half dissected, during the period of lactation (from Luschka).

then branching repeatedly to terminate in the *lobules*, or clusters of small rounded vesicles in which the milk is secreted. The lobules and lobes are bound together by connective tissue, and well packed in fat, which increases sometimes to an enormous extent the apparent size of the organ.

In the adult female the breasts swell a little at each monthly period. During pregnancy considerable enlargement takes place, and shortly after the birth of the child the milk begins to be freely secreted.

DISEASES OF THE BREAST are of frequent occurrence in women, probably on account of the great changes in activity and blood-supply to which the organ is subject.

Fissures of Nipple.—During suckling the delicate skin of the nipple often becomes abraded. The ulcers or fissures thus formed are usually very painful, so much so it may be as to render nursing impossible, and frequently lead to abscess of the breast. Their formation may usually be prevented by applying to the nipple several times daily a spirit lotion—e.g. diluted eau-de-Cologne or brandy—or an astringent—e.g. glycerine of tannic acid—both before and after nursing is begun, and by scrupulous attention to cleanliness. When they have formed, similar measures may be used; or oxide of zinc, starch, or some other drying powder, frequently applied. If severe or persistent, the use of lunar caustic may be necessary.

Acute Inflammation and Abscess.—Acute inflammation of a part of the breast or of the adjacent tissues frequently occurs during nursing, rarely at other times. In its treatment, besides measures generally useful in inflammation, the free application of belladonna in the form of ointment or liniment is of special value; and care must be taken that the milk is not allowed unduly to accumulate in the organ. When abscesses result, they should be opened with antiseptic precautions; but they are often very tedious and intractable.

Chronic Inflammation of the whole or a part of

the breast sometimes occurs, and may closely resemble a true tumour. It may disappear under the prolonged application of warmth and moisture, or other remedies which favour absorption, or may end in abscess.

Tumours.—The breast may be the seat of almost any of the numerous forms of Tumour (q.v.) met with in the body. Far the most common varieties in this situation, however, are *glandular tumours* and *hard cancer*. Glandular tumours (adenocoele) vary much in size, form, and consistence, but present in their intimate structure more or less resemblance to the normal structure of the breast, and are not dangerous to life. Their removal may be necessary on account of the pain or inconvenience they cause the patient. Cancer (q.v.), on the other hand, is all but invariably fatal if left alone, and the whole gland affected with it should be removed at once as soon as the nature of the case is recognised. Unfortunately, however, the disease frequently returns. It is most important that any lump in the breast, not obviously inflammatory, should at once be shown to a medical man, though in some cases it may be hardly possible, even for the most practised, to decide at once its nature. Here it must suffice to say that cancer of the breast very rarely begins before the age of thirty; in a woman younger than this, therefore, a tumour is not likely to be of a serious nature.

The male breast is occasionally, but very rarely, the seat of disease.

Breastwork, in Fortification, is a hastily constructed earthwork of sufficient height to protect men standing on the natural surface of the ground, and firing over it without requiring a 'banquette' to stand upon, as would be the case with the more carefully constructed work called a 'parapet.' The ditch in front, from which the earth is taken to form the breastwork, affords a slight additional obstacle to the attack. The inner surface of a breastwork is revetted (that is, faced with sods, timber, hurdles, &c.), in order that it may stand at a steep slope, thus improving the cover it gives by enabling the defenders to get close up to it. In this respect it differs from the still simpler work called an *Épaulement*.

Breath and Breathing. See RESPIRATION.

Breath. OFFENSIVE, may depend upon some cause limited to the mouth or nose, or it may arise from diseased conditions of the respiratory or digestive apparatus. If, from want of proper attention, the teeth have collected a quantity of putrescent particles around them, they must be well scrubbed with a brush and tepid water, with some powdered carbonate of magnesia mixed with it. A wash composed of a teaspoonful of tincture of myrrh or of Cond's fluid in a pint of water is also very useful. Occasionally, the secretion from the Tonsils (q.v.) is very offensive; and then a solution of nitrate of silver, 4 grains to 1 ounce of water, should be applied to them every morning, with a camel-hair brush, and small alterative doses of medicine administered. Solutions of soda in water are also very useful. Should the fetid smell arise from a portion of dead bone, the latter must be removed whenever it becomes loose. Inhalations of steam from hot water into which some creosote has been dropped, is much recommended for cases in which the cause resides in the nose and respiratory passages. When, however, it is caused by digestive derangements, the treatment should consist in purging to empty the intestinal canal, followed by soda to correct acidity, and tonics, of which the bitter infusions and tinctures, and the dilute mineral acids, are among the best.

All medical treatment is unavailing to correct the foul odour which rises from the stomach of the

habitual drunkard, or from the victim of gangrene or abscess in the lungs. See also OZENA.

Breccia, a term adopted from the Italian to designate a mass composed of angular fragments of rocks of the same or different kinds, cemented together by an enveloping paste, as, for example, by infiltrated oxide of iron or carbonate of lime. Bones and fragments of bones cemented together by calcareous matter often occur upon the floors of caves in limestone: these accumulations are termed *bone-breccia*.

Brechin, a town of Forfarshire, on the left bank of the South Esk, $8\frac{1}{2}$ miles W. of Montrose. Pop. (1851) 6638; (1891) 8955. With Montrose, &c. it returns one member to parliament. Linen and paper are the leading manufactures; bleaching, distilling, and brewing being also carried on. David I. founded a bishopric here about 1150. Part of the cathedral, late First and Second Pointed in style, is now the parish church, at whose south-west angle rises the Round Tower (q.v.) of a Culdee college, similar to the Irish ones, and to the one at Abernethy, the only other example in Scotland. Dating probably from about 983, it is 87 feet high, 25 feet in diameter at the base, and $12\frac{1}{2}$ feet at the top, which is surmounted by a 15th-century conical roof of 25 feet. Brechin Castle, the ancient seat of the Maules, and now of their representative, Arthur Maule Ramsay, fourteenth Earl of Dalhousie (born 1878; succeeded 1887), was taken by Edward I. in 1303 after a twenty days' siege. The town itself was burned by Montrose in 1645; and near it Huntly defeated the rebellions Crawfords in 1452. Dr Thomas Guthrie was a native of Brechin.

Breckinridge, JOHN CABELL, vice-president of the United States, was born 21st January 1821, near Lexington, Kentucky, where he practised law until 1847, when he was chosen major of a volunteer regiment for the Mexican war. He sat in congress 1851-55, and in 1856 was elected vice-president, with Buchanan as president. In 1860 he was the pro-slavery candidate for the presidency, but was defeated by Lincoln. A United States senator from March to December 1861, he then entered the Confederate army, was appointed a major-general in 1862, and held some important commands during the civil war. He was secretary of war in Jefferson Davis's cabinet at the close of the struggle, and escaped to Europe, whence he returned in 1868. He died at Lexington, 17th May 1875.

Brecknock, or BRECON, the capital of Brecknockshire, is situated in an open valley in the middle of the county, at the confluence of the Usk and Honddu, 183 miles W. by N. of London by rail, and 40 N.E. of Swansea. It lies in the midst of fine mountain scenery, and has beautiful public walks, the triple-peaked Brecon Beacons (2910 feet) rising to the south. From 1536 to 1885 Brecon returned one member to parliament. Flannels, coarse woollens, and hats are manufactured. Pop. (1861) 5325; (1891) 5646. Bernard de Newmarch founded the town, and built a castle here in 1094. Henry VIII. in 1541 converted a Dominican friary into a college, which was rebuilt in 1864; the priory, now the parish church, was restored by Sir Gilbert Scott in 1862. The county-hall was built in 1843. Mrs Siddons, the actress, was a native.

Brecknockshire, or BRECON, an inland county of South Wales, to the south of Radnorshire, from which it is separated by the Wye. The maximum length is 39 miles; its breadth ranges between $11\frac{1}{2}$ and 30 miles; and its area is 719 sq. m., of which only 43 per cent. is cultivated. Brecknockshire is one of the most mountainous counties in South Wales, and has deep, beautiful, and

fertile valleys. Two principal mountain-chains, the highest in South Wales, culminating in the Brecon Beacons at a height of 2910 feet, intersect the county in the north and south, and occupy, with their offshoots, a great part of the surface. Old red sandstone occupies the south and middle of the county, and Silurian rocks the north. The chief rivers are the Wye and Usk; and Llangorse Lake covers nearly 1800 acres. The climate is moist but healthy among the mountains, and in the valleys comparatively mild. The agriculture, though still defective, especially in the higher districts, has been greatly improved by the Brecknockshire Agricultural Society, instituted in 1775. The chief crops are oats and barley, but wheat is also grown in Talgarth and Crickhowell, the most fertile districts of the county. The native small black-cattle are reared in the hills, while in the lowlands the Hereford breed predominates. The mineral produce is small, consisting of iron, especially along the south border; coal and limestone are also found in the south and west. The Brecon Canal connects the county with the Bristol Channel, and many railways have been constructed throughout the county. There are several small factories of woollens and worsted hosiery; also several important ironworks, but the ore is chiefly obtained from adjoining counties. Brecknockshire returns one member to parliament. Pop. (1801) 32,325; (1871) 61,627; (1891) 57,931. The chief towns are Brecon (the county town), Builth, Crickhowell, Hay, and Llanelly. There are many remains of British and Roman camps, Roman roads, cairns, cromlechs, mounds, and castles, throughout the county. Brecknockshire formed part of the territory of the Silures, who bravely withstood the Romans. The Normans, under Bernard de Newmarch, wrested the county from the Welsh princes in 1092. Llewelyn, the last British prince of Wales, was killed at Llanafanfych, near Builth, in 1282, and by his fall the native mountain-chiefs were entirely subdued. Welsh is still the language of the middle-class and the peasantry. See Jones's *History of Brecknockshire* (2 vols. 1805-9).

Breda, a town of North Brabant, Holland, at the confluence of the navigable Mark and Aa, 60 miles ENE. of Flushing by rail, and 30 NNE. of Antwerp. It formerly possessed the means of laying the surrounding country under water in the event of an attack, but the importance of the town as a military position has passed away, and in 1876 the fortifications were removed. Its Gothic cathedral (1510) has an octagonal steeple 311 feet high, and several interesting monuments; whilst the castle (1350) received its present shape from William III. (1696), and in 1828 was converted into a military academy. There are manufactures of carpets, linen, hats, soap, leather, &c., and dye-works, breweries, and rope-walks. Pop. (1869) 14,765; (1891) 22,987. Breda is celebrated as the place where, in 1566, the protest of the Dutch nobles, known as the 'Compromise of Breda,' against the measures of Philip II. of Spain in the Netherlands, was presented and rejected. The 'Declaration of Breda' (April 1660) was Charles II.'s manifesto prior to the Restoration; whilst by the 'Treaty of Breda' (1667) between England, France, Holland, and Denmark, England got St Christopher, Antigua, and Montserrat, and France Acadia. Breda has suffered numerous sieges, having been captured by the Spaniards (1581), by the Dutch under Maurice of Orange (1590), by Spinola (1625), again by the Dutch (1632), and twice by the French (1793-95), who were finally driven out in 1813.

Brederode, HENRY, COUNT OF, born in Brussels, in December 1531, was a leader of the

disaffected nobility in the struggle against Spain. He drew up the 'Compromise' of 1566, and headed the deputation to whom the name *Gueux* (q.v.) was first applied. He was active in organising the fraternity, but the failure of an attempt, in the following year, to raise an armed revolt in Amsterdam, obliged him to flee to Germany, where he died at Recklinghausen, 24th August 1568.

Bree. MATTHIAS IGNATIUS VAN, a Flemish painter, was born at Antwerp in 1773, and in 1797 gained the *prix de Rome* by his 'Death of Cato.' In 1804 he returned to Antwerp, where he became director of the Academy of Fine Arts, and died 15th December 1839. His chief works are the 'Entrance of Napoleon into Antwerp,' the 'Death of Rubens,' in the Antwerp Museum, and the 'Patriotism of the Burgomaster at the Siege of Leyden, 1576,' in the town-house of Leyden.—His brother, PHILIPP JACOB VAN BREE (1786-1871), also acquired some reputation as an historical painter.

Breeches Bible. See BIBLE, p. 127, col. 2.

Breech-loading is the method of introducing the charge into a firearm at the breech instead of the muzzle. The breech is then closed by a block of metal which is held in its place by a hinge and lever, or by a bolt with a bayonet joint, in the case of small-arms, and in that of heavy guns by a screw or a wedge.

Military Small-arms.—The advantages of the breech-loading military rifle are very manifest. It enables a recruit to fire four times as fast as the best-drilled soldier armed with a muzzle-loader, and a cavalryman to load his carbine even at a gallop. The absence of Windage (q.v.) renders the action of the powder stronger and more uniform, thus increasing the range and accuracy of the weapon. The rapidity of fire can be still further increased by the addition of a magazine, as described under RIFLES.

The Prussian needle-gun (1841) was the first breech-loading rifle carried by European troops. Its breech is closed by a bolt carrying a long needle. This is driven by the hammer completely through the powder, and ignites it in front by striking a patch of fulminate placed at the base of the sabot which carries the bullet. The latter is oval, and fits the bore loosely, the sabot taking the grooves and causing it to rotate. The cartridge is of thin paper, and intended to be consumed on discharge, thus avoiding the necessity of extracting the empty case. The French Chassepôt (1866) is also a bolt-action breech-loader firing a paper cartridge ignited at the base.

The Sharp breech-loading carbine, long used by the cavalry in British India, has a similar consumable cartridge. The breech of each of these rifles is ineffectually closed, and the 'spitting' inconveniently great, in spite of an attempt, in the case of the Chassepôt, to prevent it by an india-rubber washer or ring; nor is the cartridge paper always consumed. The metallic cartridge (called by the French *cartouche obturatrice*), which 'obturate' and seals the breech at the moment of explosion, has now been universally adopted to remedy this defect.

The first re-armament (1866) of the British infantry with breech-loading weapons was effected by converting the Enfield rifle on the Snider principle: the result of experiments carried on with fifty different systems in 1864. The breech-action of this rifle is well described by its French name, *fusil à tabatière*. The breech-block is hinged on to the side of the barrel, and contains a piston or striker, by means of which a blow is communicated from the hammer to the cap at the base of the cartridge. After firing, the hammer is raised, and the breech-

block opened like a snuff-box. The block also slides upon its hinge, and when pulled towards the butt, catches the empty cartridge-case and loosens it, so that it can be thrown out.

The Martini breech-action, which superseded the Snider in 1871-74, and which was retained in the Enfield-Martini rifle issued in 1888 to the British army, is a block and lever system. The lever, *c*, in fig. 1 is hinged behind the trigger-guard, and

Fig. 1.—Enfield-Martini Breech :
A, in section; B, with part of side plate removed.

free at the end next the stock. On being pulled down, away from the stock, this lever depresses the front end of the breech-block, hinged at *d*, which contains the striker, opens the breech, and compresses the spring, thus bringing the trigger to full-cock, and extracts the empty cartridge-case. A fresh cartridge being introduced, the block is returned to its place by the return movement of the lever, and the rifle is ready for firing. The Lee-Enfield rifle at present in use has the Enfield barrel in connection with the Lee breech-action.

As an example of the bolt-action, fig. 2 shows the German Mauser rifle. This action has been

Fig. 2.—German Mauser Rifle.

adopted by all European nations, except Great Britain, as being simpler and more direct. To close the breech, the bolt, *a*, carrying a striker and extractor, is pushed forward and turned down to the right. After firing, the reverse process opens the breech and extracts the cartridge.

The Lee-Metford rifle, introduced into the British army in 1890, will be found fully described, with diagrams, under RIFLE. See also BULLET, CARTRIDGE. Revolvers (q.v.) usually have a breech-action similar to that of sporting guns (see p. 420).

Artillery.—The difficulty of closing the breech in a simple and effectual manner, especially with heavy guns, the structural complications involved, the impossibility of using a simple time Fuse (q.v.), owing to absence of Windage (q.v.), and the greater

cost, were long the chief objections to breech-loading artillery. Krupp (1812-87), in Germany, always advocated this construction, and in 1859 the Armstrong

Fig. 3.—Section of Krupp Breech.

breach-loading system was introduced into the British service, only, however, to be abandoned in favour of muzzle-loading some six years later. Other nations gradually re-armed their artillery with breech-loaders, and in 1880 breech-loading field-guns began again to be made at Woolwich Arsenal; in 1888 the heaviest guns were being so constructed. The reasons given are chiefly due to fortress and naval requirements. The immense power necessary to pierce modern ships' armour is obtained by using a slow-burning powder, requiring the projectile to be held fast until a pressure of from 1 to 2 tons per square inch is set up in the powder chamber, which can only be done in a breech-loader. The power of the gun is increased by making it longer, and many such guns are placed in turrets, or other confined spaces, where their length prevents their being loaded at the muzzle. The use of the so-called obturator has met the diffi-

Fig. 4.—Section showing Obturator.

their greater liability to injury on service.

There are practically only three methods of closing the breech of a gun—viz. the *screw*, the *wedge*, and the *interrupted screw*. In the Armstrong screw-gun, shown in fig. 5, the breech is closed

Fig. 5.—Armstrong Breech.

by a 'vent-piece,' *a*, held in its place by a hollow 'breech-screw,' *c*, through which the gun is loaded; the lever, *b*, being used to screw it up firmly. A copper face to the edge of the vent-piece, or a tin cup in front of it, more completely closes the breech, and is the earliest form of 'obturator.' The *wedge* breech-action invented by Lord Armstrong con-

sisted of two wedges sliding on their sides in a slot, and also a heavy sliding handle arranged to act as a hammer, and so tighten the wedges, which, when loose, could be drawn out sufficiently to admit the charge. Very few guns were made with this action.

The Krupp breech system, shown in fig. 3, has a round-backed wedge pushed in from the side, and forced firmly home by a screw and lever handle. Its face carries a removable flat plate, which presses against a Broadwell ring let into the end of the bore. It is axial vented, like all modern heavy breech-loading guns.

The *interrupted screw* system (fig. 6) has been adopted by the French, by the Royal Gun Factories at Woolwich, and the Elswick Ordnance Company (Armstrong, Mitchell, & Co.). It consists of a solid steel breech-block furnished with a screw-thread of the requisite pitch and strength fitting into a similar female screw in the gun. The surface of the block is divided longitudinally into six or eight equal

Fig. 6.—Elevation of Breech (open).

parts, and the screw-thread planed away from alternate portions. In the gun the parts corresponding to the smooth portions are left, and those between them slotted away. A turn of one-sixth or one-eighth of a circle enables the block to be drawn out, and a carrier, hinged to the side, swings it clear of the bore. The bearing surface, and consequent strength of the screw, is reduced one-half by this method, but this can be compensated for by increasing its length, which would not appreciably affect the time occupied in opening or closing the breech, or by making it conical, and forming the screw-threads in steps, with the blank spaces on one opposite the screw-threads on the other. Additional mechanism and extra leverage are supplied when the size of the gun requires it.

The obturator, *O* in fig. 4, the invention of De Bange, of the French artillery, is similar in the French, Woolwich, and Elswick guns, but the latter sometimes have a different pattern, called the 'Elswick-cup.' Some safety arrangements, making it impossible to fire the gun until the breech-block is screwed home, are common to all three. See CANNON, FIREARMS, GUN, REVOLVER, and RIFLE.

Breech-loading Sporting Guns are made on a totally different principle, called the drop-down action. Nearly every maker has a patent for different details, but almost all are founded on the Lefauchaux action, invented in 1825. This consists of a piece of steel called the 'lump,' securely fastened to the under-side of the breech end of the barrels, and about 2 or 2½ inches long; the fore end of this lump is hinged by means of a pin to the corresponding part of the breech-piece (*d, e, f*, fig. 7) at *d*, and on this hinge the barrels are moved in opening and shutting the breech. The lump is, in

most guns, cut into two divisions, *c*, which fit into slots in the breech-piece, and both parts have notches, into which an ingenious arrangement called, from the inventor, a 'Purdey' bolt, snaps when shut. An additional grip to add solidity is also generally provided in various forms of an extension of the top rib, *b*. The modern breech-loading sporting gun is generally made hammerless—i.e. without outside hammers, but the locks, which are let into slots in the breech-piece, are usually made, more or less, on the old principle. A main-spring, on the pull of the trigger, explodes the cap in the rear end of the cartridge by means of a hammer, either acting directly through a hole in the breech (as in the Anson and Deeley lock), or by means of a detached rod inserted in the hole.

Fig. 7.—Greener's Self-acting Ejector Gun.

Fig. 7 represents one of the many first-class breech-actions, Greener's self-acting ejector gun. A movement of the top lever, *a*, to the right, simultaneously slides the cross bolt from the hole in the extension top rib, *b*, withdraws the double Purdey bolt from the lump, and the barrels tilt over. Swivels attached to either side of the rear end of the lump cock the hammers ready for firing again; a lever at the same time ejects the used cartridge-case. The figure shows the gun as opened after firing the right barrel, from which the cartridge-case, *g*, is being ejected. When the breech is closed, all the bolts snap into their places. There is a safety arrangement on the side of the gun, acting on the trigger, and another automatically obstructing the fall of the hammer, which prevent the gun being accidentally discharged. See GUN; also J. H. Walsh's ('Stonehenge') *Modern Sportsmen's Gun and Rifle* (1882-84); W. W. Greener's *Gun and its Development* (1881), and his *Modern Shot Guns* (1888).

Breed, a term applied to varieties of animals which have been developed more or less directly under human control. Since organisms are liable to change, even the encroachment of civilisation on their old habitats is liable to cause variation. When useful animals are subjugated or tamed by man, when they are brought under the changed conditions of domesticated life, and above all, when their coupling is controlled by human selection, distinct breeds arise. Some breeds have doubtless arisen unintentionally, or as we say naturally, others have from the first been subject to man's purposeful improvement. Some have been formed very slowly and insensibly (e.g. race-horse, greyhound, gamecock, carrier-pigeon), while others have appeared as sudden, more or less abnormal and pathological, variations (e.g. ancon and mawchamp sheep, turnspits, pug-dogs, short-faced tumbler-pigeons). The slowly formed varieties, arising, like most of the species in nature, by steady progress in some definite direction, are more permanent; the more sudden sports and fancy forms are less fixed,

and are more apt to revert to the primitive type, or to vary again in some new direction. From zoological analogies, from the occurrence of reversions, and from definite historical evidence, it is now regarded as certain that very many of the domestic varieties or breeds with which we are familiar have descended from a common stock. The domesticated cattle, dogs, fowls, horses, pigs, sheep, &c., are regarded zoologically as variations of one or a few species. The old notion of a distinct origin for each distinct breed is no longer seriously maintained. Their history in general terms has always been the same: wild forms were domesticated, were allowed to breed among themselves, further variations were selected as more fit, reversions were thrown out, and desired forms stereotyped by controlled coupling.

History.—Domestication began in the early savage state. Only a few animals were tried, because few were capable of taming, few promised direct usefulness, and only a few could endure domestication without loss of fertility. The animals thus domesticated in different localities varied very greatly in their new conditions, and as the fitter variations were selected for breeding, numerous sub-breeds arose, and the variety as a whole came to vary more and more markedly from the original wild forms. In some cases, different wild species—e.g. of dog, ox, pig—were in this way subjugated and changed, and thus we have distinct domestic species. In other cases the same wild species would in its domestication in diverse localities experience different changes, and thus different domestic varieties of the same species occur in various countries. As the animals continued—with increased rapidity indeed—to vary under the manifold influences of domestication, the breeder might set apart one set of variations for one purpose, another set for another, and thus a breed became split up into various sub-breeds. For the detailed history of the different breeds, the reader must consult the various articles dealing with domesticated animals—e.g. CATTLE, DOG, HORSE, SHEEP.—What is true of animals is also true of plants, whether cereals, vegetables, or decorative flowers, though the word breed is not usually extended to vegetable organisms. De Candolle's treatise on the *Origin of Cultivated Plants* (Inter. Science Series, 1884) may be profitably consulted on this subject.

Theory of Breeds.—While the whole subject of domestication will be elsewhere discussed (see DOMESTICATION), some general facts in the formation of breeds must be noticed. (a) The whole process is started by the liability of organisms to change, either (1) in the line of their constitutional tendencies (e.g. increase of fat, hair, decoration, strength, swiftness), or (2) as the direct result of novel external conditions, or (3) in consequence of the increased use or disuse of various structures. (b) The process is sustained by restricting the pairing to organisms of similar constitution. If a variety were allowed to pair with another of a very different tendency, the result would be that the desired variation would in all probability be less marked in the offspring. The secret of breeding is of course to couple those forms from which a continuance of the peculiar features of the breed may be most probably expected. Sexual reproduction, being the mingling of different experiences, is in itself an abundant source of variation, hence the importance of pairing similar forms. To analyse the results of domestication is a complex problem, for the influence of constitutional variability, of restricted or selected sexual range, of changed environment, of altered function, have all to be kept in view. The process of breed-forming is only a special case of what goes on in nature's species-forming, with those important differences,

that the life is artificially conditioned, the habits artificially restricted, the sexual reproduction artificially selected. By artificial, we describe conditions which do not find any accurate parallel in nature when unrestricted by human interference. In drawing analogies between the origin of breeds and the origin of species, it must also be remembered that the number and range of domesticated animals is comparatively small, that the variations desired by man concern for the most part the vegetative or nutritive as opposed to the reproductive system, and that in many cases the domesticated males are only in exceptional forms allowed to become reproductive at all.

Variations of Breeds.—While many of the peculiarities which distinguish the various breeds and sub-breeds are very slight, 'no part of the organisation escapes the tendency to vary.' The skin and its outgrowths of hair, feathers, horns, wattles, &c., vary extremely in form, texture, colour, and degree of development. The wool of sheep, the plumes of fowls and canaries, the horns of cattle, the wattle of the carrier-pigeon, are familiar examples. The webbing of the feet of water-dogs is also an instructive case. The muscular system also varies, especially in response to increased use or disuse. What happens in men following different trades, happens similarly in domesticated animals, such as beasts of burden, when habituated for generations to special services. The drooping of the ears is also an illustration of frequent muscular change. The skeleton, too, varies, as is well pointed out by Darwin in the case of pig, mink, rabbit, fowls, pigeons, &c. By attending to such trivial characters as the form of the comb or the plume of feathers on the head, the breeder has given ridges to the skull. The various breeds of short-legged animals (e.g. sheep and dogs) illustrate considerable modifications of the skeleton. The teeth also exhibit many variations in domestic animals. The alimentary system and other internal organs are not such that the breeder can direct much attention to the increase or decrease of their tendencies, but they do vary for all that. The lungs and liver of improved breeds of cattle are found by Professor Tanner 'to be considerably reduced in size when compared with those possessed by animals having perfect liberty.' In the case of the pouter pigeon, the zeal of the breeder for the peculiar form characteristic of that variety of bird, has enormously increased the width of the esophagus. The changed conditions of life frequently render the reproductive organs more or less impotent. Many other modifications of internal structure, even of the brain, have been recorded. For a detailed account of the various direct and indirect influences of man's control of animals, Darwin's work on the *Variation of Plants and Animals under Domestication* must be consulted, and also such works on the structure of our domestic animals as are referred to under special articles. It hardly needs to be pointed out that the characters due directly to breeding—i.e. to intentional control—must be distinguished from those which are simply the secondary results of that change of life which is expressed in domestication.

Practical Breeding.—On this subject works on animal culture must obviously be consulted. The general theory is simple, the practical details numerous. Since many desired variations are still unstable, the breeder has constantly to be on the watch that these do not revert under changed conditions, or become washed out by careless coupling. To preserve a given peculiarity, similar forms must be paired, and yet this 'breeding in and in' may be pursued too far to the degeneration of the stock. Too great attention to non-reproductive characters, in the anxiety to spread and

stereotype some desired feature, may tend to general reproductive impotency. When a variation crops up which is novel and desirable, the breeder has to segregate the varying forms, and by controlling the range of reproduction, manufacture a new sub-breed. That this has been repeatedly done is demonstrated by the history of breeds. It seems tolerably certain, however, that only constitutional variations can be transmitted to the offspring, and not such as may be impressed from without upon the parent. The latter may indeed become part of the hereditary capital if the external condition inciting change persist through a series of generations. When this is so, the externally impressed variation becomes deeply rooted, saturates through the organism, becomes part of the constitution, affects the reproductive elements, and may be then transmitted. See HEREDITY.

The whole subject of breeds is one of immense practical and theoretical importance. Without our existing breeds of domesticated animals, from silkworms to horses, human life would be a very different matter. And while the experimental energy of breeders has in some cases become an enthusiastic craze, this same energy has vastly increased the wealth of those civilised countries where the subject receives most attention. The body of experimental fact now accumulated has raised the practice of breeding from the more or less haphazard affair of earlier days to a practical art, in which skill and patient care can (within certain limits) insure any desired result. To the biologist again, the subject is one of unbounded interest. For, in the annals of breeding, as Darwin's patient investigations first emphatically showed, he has the record of a vast series of experiments on the origin of species. On the problems of variation, of environmental influence, and of hereditary transmission, the facts accumulated by breeders have shed and are shedding a great flood of light. See CANARY, CATTLE, DOG, DOMESTICATION, ENVIRONMENT, FOWL, HEREDITY, HORSE, HYBRID, PIGEON, SHEEP, VARIATION, &c.

Breedé, a river in Cape Colony, rises in the Warm-Bokkeveld, and flows chiefly in a south-east direction through the district of Zwellendam, entering the Indian Ocean at St Sebastian's Bay, about 60 miles N.E. of Cape Agulhas, the most southerly point of Africa. It is navigable for vessels drawing not more than 10 feet of water to a distance of 40 miles, and drains a very fertile district.

Bregenz, a town of Austria, capital of the district of Vorarlberg, is picturesquely situated on the east shore of the Lake of Constance, 6 miles S.E. of Lindau by rail. The opening of the Arlberg Railway (1884) increased its importance. The ancient *Brigantium*, it was an important Roman station, and was for several centuries one of the chief fortified places in Southern Germany. During the Thirty Years' War, the Swedes in 1646 stormed and captured the fortress. Pop. 6739.

Brehm, ALFRED EDMUND, naturalist, was born 2d February 1829, at Renthendorf, in Thuringia, and was son of the pastor there, Christian Ludwig Brehm (1787-1864), a great ornithologist. Young Brehm travelled five years in Africa, then went to Jena and Vienna to study natural science. He subsequently travelled in Spain, Norway, Lapland, Siberia, and Turkestan, became keeper of the Hamburg Zoological Garden in 1863, in 1867 founded the Berlin Aquarium, and died in his native place, 11th November 1884. His *magnum opus* is the *Illustriertes Thierleben* (2d ed. 10 vols. 1876-79).

Brehon Laws, the name given by the English to the system of jurisprudence which prevailed among the native Irish from an early period till

towards the middle of the 17th century. The *breitheamhuin* (pronounced *brei-hoo-in* or *brehon*), from whom the laws have received their name, are supposed to have been hereditary judges, who administered justice among the members of their tribe seated in the open air, upon a few sods, on a hill or rising ground. The poet Spenser in his *View of the State of Ireland*, written in 1596, describes the Brehon Laws as 'a rule of right unwritten, but delivered by tradition from one to another, in which oftentimes there appeareth great share of equity in determining the right between party and party, but in many things repugnant quite both to God's law and man's: as, for example, in the case of murder, the brehon—i.e. their judge—will compound between the murderer and the friends of the party murdered, which prosecute the action, that the malefactor shall give unto them, or to the child or wife of him that is slain, a recompense, which they call an *eric*; by which vile law of theirs many murders amongst them are made up and smothered.' Spenser was ignorant that pecuniary compensation for manslaughter had obtained in the ancient laws as well of England as of most European nations. He was mistaken, too, in believing that the Brehon Laws were an unwritten code. Among numerous portions of manuscript collections of the Brehon Laws still existing in public and private libraries may be mentioned those of the Royal Irish Academy, Trinity College, Dublin, the British Museum, and the Bodleian. These manuscripts are regarded as varying in date from the early part of the 14th to the close of the 16th century. For the laws themselves a much higher antiquity is claimed. Portions of them are referred to in compilations of the 10th century, and it may be, as has been suggested, that the redaction of them in their present form was due to Cormac Mac Cuilleannain (killed 903 A.D.), king and archbishop of Cashel, a man of great learning and energy; but of this there is no actual record. The recension of the code, known as the *Seanchus Mor*, is traditionally ascribed to St Patrick (5th century), who is said to have expunged from the laws all institutions savouring of heathenism; and here again we are met with references to written laws dating from the reign of Cormac Mac Art (3d century). The language in which the Brehon Laws are composed is Ancient Irish, and though in general intelligible enough, it is sometimes rendered obscure by technical and obsolete legal terms, of which the exact meaning is uncertain.

The form of society presupposed by the laws is such as is known to have existed in Ireland in the earliest historic times. The basis of it is the tribe, and the principal occupation is the pasturage of cattle or the tillage of the soil. The whole community is arranged in a graded system of monarchs, provincial kings, chiefs, proprietors, clansmen, and serfs of an alien race. The land seems to have been divided into two parts, one as common pasture ground, the other portioned out among the chiefs and other tribal dignitaries, with the poorer clansmen and serfs holding as tenants under a proprietor. The use of coined money is apparently unknown, as fines and valuations are represented in terms of so many head of cattle.

Every part of life comes within the range of the law; there are regulations for the fostering of the children of the nobles, for their food and education, for their dress and its quality, along with ordinances regulating the holding of courts and the giving of evidence. And in the midst of all this, there survive the remains of a pagan past not yet eradicated by Christianity, such as the laws of marriage and magical ordeals. In 1852 a Royal Commission was appointed 'to

direct, superintend, and carry into effect the transcription and translation of the ancient laws of Ireland, and the preparation of the same for publication.' The commissioners intrusted the transcription and translation of the Brehon Laws to the two most eminent Irish scholars—Dr John O'Donovan, professor of Celtic in the Queen's College at Belfast, and Eugene O'Curry, professor of Irish Archaeology in the Roman Catholic university of Ireland. Four volumes have appeared under various editors—the last in 1885—under the title of *Ancient Laws and Institutes of Ireland*. Along with the Irish text, an English translation is given, accompanied with preliminary dissertations and indexes, and they give a vivid and characteristic picture of the polity and social life of a Celtic people.

Breisach, ALT, a town of Baden, situated on an isolated basalt hill (804 feet) on the right side of the Rhine, 14 miles W. of Freiburg. The *Mons Brisiacus* of Caesar, it was taken by Ariovistus when he invaded Gaul; being regarded as the key to the west of Germany, it figured prominently in the wars of the 17th and 18th centuries. The minster is a 13th-century structure. Pop. 3088.—Neu Breisach (pop. 2500), on the other side of the Rhine, in Alsace, was built by Louis XIV. in 1697, when Alt Breisach was given back to the empire.

Breisgau, a district of Baden extending along the right bank of the Rhine, from Strasburg to Basel, embracing the southern Black Forest. The chief town is Freiburg.

Breitenfeld, a village of Saxony, 5 miles N. of Leipzig, remarkable for three battles fought in its neighbourhood. In the first, fought on the 17th September (old style, 7th) 1631, Gustavus Adolphus inflicted a decisive defeat upon the imperialists under Tilly, who, as well as his generals, Pappenheim and Fürstenberg, was wounded. The second battle was also a victory of the Swedes under Torstenson over the imperial forces under the Archduke Leopold and Piccolomini, 2d November (old style, 23d October) 1642. The third battle was one act of the great 'Battle of the Nations' at Leipzig, 16th October 1813.

Bremen, one of the three free cities of Germany, is situated on the Weser, 39 miles by rail SSE. of its port, Bremerhaven, and 76 miles NW. of Hanover. Pop. (1875) 102,177; (1890) 124,955, or with suburbs, 145,000, nearly all Protestants. Bremen is divided into the Old and the New Town—the former on the right, the latter (dating from 1620) on the left bank of the river, which is spanned by four bridges. The ramparts and bastions round the old town have been levelled and formed into public promenades, which are laid out with excellent taste. Among the principal buildings, the cathedral (1043-70; reconstructed 13th to 17th centuries; being restored in 1888), the Gothic town-hall (1409), with its famous wine-cellar, said to contain hock of the vintage of 1624, the 'Schütting' or guildhall (1537), the exchange, the museum, the post-office, and the observatory of Dr Olbers, from which he discovered the planets Pallas and Vesta, are remarkable. Its position makes Bremen the emporium of Brunswick, Hesse, and other countries through which the Weser flows. Besides its excellent water-communication, it is connected by railways with the whole of Western and Central Germany. Bremen is an exceedingly thriving place, and now ranks as the second commercial city in Germany. Till of late all large vessels had to stop at Bremerhaven, and only ships not drawing more than 7 feet of water came up to the town itself; but a comprehensive scheme for the deepening of the river-bed, so as to allow the passage of

ships drawing 16 feet of water, was carried out in 1885-95, at a cost of £1,500,000. Bremen carries on an extensive commerce with Great Britain, North and South America, the West Indies, Africa, the East Indies, and China. Its great foreign trade, however, is with the United States, from which alone it imports annually produce of the estimated value of £10,000,000, exporting in return goods to the value of about £5,000,000. Bremen ships about 50 per cent. of all emigrants sailing from Germany, principally to the United States. The total number of vessels arriving at Bremen annually is about 2500, with a tonnage of above 1,500,000 tons. The ships belonging to the port number about 400 (170 steamers) of a tonnage of 400,000 tons. The annual value of the imports is over £30,000,000, of exports £25,000,000. Bremen claims to be the first port in the world for the import of tobacco and rice; for cotton and indigo the first on the Continent; for wool and petroleum it fairly rivals Antwerp and Hamburg. In the year 1858 the imports were valued at only £8,237,000, and the exports at about £8,000,000. The chief imports are tobacco, coffee, sugar, cotton, rice, skins, dyewoods, wines, petroleum, timber, and hemp. The exports consist of woollen goods, linens, glass, rugs, wool, hemp, hides, oil-cake, colours, and wooden toys. Large quantities of tobacco are re-exported. There are manufactures of woollens and cottons, cigars, paper, and starch, and breweries, distilleries, rice-mills, and sugar-refineries. The cigar and sugar manufactures have of late declined, the former owing to the increase of duty. Bremen is the headquarters of the North German Lloyd Steamship Company (1857), and has steam-communication with all parts of the world.

Bremen first became of historical note in the 8th century, when it was erected into a bishopric by Charlemagne. It soon attained considerable commercial importance, and became one of the principal cities of the Hanseatic League (q.v.). It frequently suffered at the hands of the French, and was in 1810 incorporated with that empire; but recovered its independence in 1813, and by the Congress of Vienna was admitted in 1815 as one of the Hanse towns into the Germanic confederation. In 1867 it became a member of the North German confederation, and now it forms part of the German empire. In 1884 it agreed to a surrender of its privileges as a free port, to take effect from 1st October 1888; but certain new docks and warehouses (the *Freihafen Gebiet*), as well as the Bremerhaven docks, are excepted from this arrangement. The area of the territory is about 100 sq. m.; pop., including the town of Bremen (1890) 179,714. The government is intrusted to a senate of 16 members, 2 of whom are chosen burgomasters, and to a municipal council of 150 burgesses.

Bremer. FREDRIKA, the well-known Swedish novelist, was born at Tuorla near Abo, in Finland, 17th August 1801; and was brought up at Arsta, about 20 miles from Stockholm. At seventeen she was taken for her health a tour through Germany, Switzerland, and France. Soon after, the poetry of Schiller set her young imagination aglow, and the restlessness of her temperament drove her to writing—the only outlet for her energy that was open to her. In 1828 appeared the first volume of her *Sketches of Everyday Life*, but the second volume, *The H. Family* (1833; Eng. trans. 1844), first revealed her power. From this time she devoted herself to writing stories that quickly became popular in translations far beyond the bounds of Sweden, and she varied her literary labour by long journeys in Italy, England, the United States, Greece, Palestine, which supplied the materials for her *Homes of the New World* (1853), and *Life in the Old World* (1862), full of

fine descriptions of scenery and vivid pictures of social life, with sound views on political and moral questions. The admirable translations of Mary Howitt had preceded her in America as well as England, and insured her an equally warm welcome on both sides of the Atlantic. On her return to Sweden she gave herself up to philanthropy, but more particularly to the education and emancipation of women, and the consequent propagandist character of her later novels, *Bertha* and *Father and Daughter* (1859), was detrimental in no small degree to their literary value. Her religious views she set forth in her *Morning Watches* (1842). She spent her last years at Arsta, and died there 31st December 1865. Her *Life and Letters* were edited by her sister in 1868, and were at once translated into English and German. She has been called, and not inaptly, the Jane Austen of Sweden. She resembled the English novelist in delicacy, shrewdness, and love of quiet domestic incident, but fell far short of that subtlety in simplicity which is the secret of her charm, and that marvellous insight into women, if not men, on which depends her power. Of Miss Bremer's stories perhaps the most perfect is *The Neighbours* (1837; Eng. 1844). *The Diary*, *The President's Daughters*, *Brothers and Sisters*, *Strife and Peace*, and *Scenes in Dalecarlia* are only less popular.

Bremerhaven. the port of Bremen, on the east shore of the Weser estuary, nearly 10 miles from the open sea, and 39 NNW. of Bremen. It was founded by Bremen in 1827 on ground acquired from Hanover, and rapidly became a thriving place. A second dock was opened in 1866, a third in 1874; and in 1888 a great port, with docks, was undertaken at Nordenham, on the opposite bank. A dreary place, with its music-halls and beer-shops, Bremerhaven was the scene in 1875 of a dynamite outrage, the premature explosion of a mail steamship, by which 60 persons were killed. The Geeste separates it from Geestemünde (q.v.). Pop. (1850) 3500; (1890) 16,414.

Brendan. SR, of Clonfert, born at Tralee in 484, studied under St Jarlath of Tuam, and was ordained by Bishop Ere. His name is memorable chiefly for his voyages in search of 'the mysterious land far from human ken.' After seven years' fruitless wandering he returned, but once more, in a ship of wood instead of hides, set sail with sixty friends, and at length after many wanderings reached 'that paradise amid the waves of the sea.' Brendan founded a monastery at what is now Clonfert, and died in 577 in the ninety-fourth year of his age. His festival is on the 16th of May. The *Navigation of St Brendan* was a very popular book in Western Europe as early as the 11th century, but the two voyages were compressed into one, and many other adventures added. In maps before Columbus' day, 'St Brendan's country' is placed to the south of the island of Antilia and west of the Cape Verde Islands. See O'Donoghue's *Brendaniana* (1894), and Lord Bate in the *Scottish Review* for 1893.

Brenner Pass. a pass in the Central Tyrol Alps, on the road between Innsbruck and Bozen, connecting Germany with the north-east of Italy. It is the lowest pass which crosses the main chain of the Alps, the summit being only 4588 feet above the level of the sea. Lofty mountains rise above it, but the scenery is less sublime and less interesting than that of any other of the great passes of the Alps. It is open at all seasons of the year. At the summit of the pass the traveller finds in close contiguity the Eisach, a small stream, which, after growing to be a considerable river, joins the Adige and the Sill, a tributary of the Inn; the

one stream flowing to the Adriatic, and the other into the Black Sea. In 1867 a railway through the pass was opened, and thus a complete line of railway communication was established between Germany and Italy. This work was begun by the Austrian government when Venetia belonged to the Austrian empire. The distance from Innsbruck to Botzen in a direct line is only 52 miles, but frequent windings extend the railway to 78 miles. It passes over numerous viaducts and bridges, and through twenty-seven tunnels, one of which has a length of 935 yards. This line is still the shortest route between the eastern half of Germany and Italy, though it has now a rival in the St Gothard Railway.

Brennus, the Latinised form of a Celtic royal title.—(1) The leader of the Senonian Gauls who, in 390 B.C., crossed the Apennines and overthrew on the banks of the Allia (q.v.) the Roman army. On their entry into Rome the Gauls found that most of the inhabitants had fled save the senators, who, with pathetic heroism, had resolved not to survive the destruction of their homes. Clothed in their robes of dignity or office, and sitting in their curule chairs, they waited the approach of their enemies, and received their death in majestic silence. Brennus plundered the city and besieged the capitol for six months, during which time occurred the famous night-attack, which would have been successful had not the cackling of the geese in Juno's temple awakened the garrison. The Romans were at length compelled to treat with the besiegers. They offered a thousand pounds of gold for their ransom, which was agreed to. To counterpoise the gold, Brennus flung his sword into the opposite scale, crying as he did so, *Vae victis* ('woe to the vanquished'). But Camillus, who had been recalled from banishment and appointed dictator, appeared with his soldiers in the nick of time, at once set on the enemy, and after a desperate struggle cut them off to a man. According to Polybius the Gauls returned home in safety with their booty.—(2) The Gallic chief who invaded Greece, 279 B.C., at the head of 150,000 foot and 20,000 horse. After desolating Macedonia, he forced his way through Thessaly to Thermopylae, and hurried on to Delphi with a view to plunder. The Delphians bravely resisted, and aided by an earthquake and a terrible storm, besides the supernatural help of Apollo, they utterly routed the Gauls, who fled in dismay. Brennus was taken prisoner, and drank himself to death in his despair.

Brenta (*Medoacus Major*), a river of North Italy, issuing from a small lake in the Tyrol, and flowing 120 miles southward and eastward through the Venetian territory, till it falls into the Gulf of Venice at the haven of Brondolo. The old bed of the river was made use of as a canal, which forms the chief communication by water between Venice and Padua; while the Brenta is but little used for navigation.

Brentano, CLEMENS, romanticist, the brother of Goethe's 'Bettina,' was born at Ehrenbreitstein, 8th September 1778. Save for the six years (1818–24) he passed with the 'Nun of Dülmen,' recording her revelations, he led a restless, unsettled life, and showed plain signs of derangement some years before his death at Aschaffenburg on 28th June 1842. In his earliest poems the peculiarities of the Romantic school of his time are carried to excess. His dramatic productions, the best of which is *Die Gründung Prags*, are characterised by great dramatic power, amusing though rather far-fetched wit, and a wonderful flow of humour. Brentano was most successful in his smaller novels, particularly in the *Geschichte vom braven Kaspar*. His

collected works fill 9 vols. (1852–55), and there is a good selection by Diel (1873), who has also written his *Life* (1878). See also ARNIM, LUDWIG VON.

Brentano, LUJO, political economist, was born at Aschaffenburg, in Bavaria, 18th December 1844. He studied at Dublin, and at four German universities; and after attaining a post in the royal statistical seminary in Berlin, went to England to study the condition of the working-classes, and especially trades' associations and unions. The outcome of this was his work *On the History and Development of English Guilds* (Lond. 1870); *Die Arbeitergilden der Gegenwart* (2 vols. Leip. 1871–72). He has been professor at Breslau (1873), Strasburg, Vienna, Leipzig, Munich (1891). He supports the 'Socialists of the chair' (*Kathedersozialisten*) against the German free-trade school, and has written works on wages (1877), labour in relation to land (1877), and compulsory insurance for workmen (1881), on the English Chartists, on the Christian Socialist movement in England (2d ed. Leip. 1883), and numerous polemical pamphlets.

Brentford, the county town of Middlesex, 10 miles W. of Paddington station, at the influx of the Brent to the Thames, which is crossed here by a bridge leading to Kew. Consisting chiefly of one long irregular street, it has figured in literature, not always creditably. Falstaff disguises himself as a 'fat woman of Brentford.' Cowper and others allude to its 'two kings on one throne.' Thomson calls it 'a town of mud;' Gay has spoken of its 'dirty streets;' and its modern condition is not irreproachable. It has gin-distilleries, a brewery, sawmills, a soap-work, the Grand Junction Water-works, the terminus of the Grand Junction Canal, and railway docks. There are many market-gardens in the vicinity. Here Edmund Ironside defeated the Danes in 1016, after expelling them from London; in 1558 six martyrs were burned at the stake; and in 1642 the Royalists under Rupert defeated the Parliamentarians under Colonel Hollis. Pop. (1881) 11,808; (1891) 13,736.

Brent Goose, or BRENT BARNACLE (*Bernicla brenta*), a species of wild goose, breeding in the far north, coming south in winter in great numbers, and often shot along British and other coasts. It is common in markets. The head, neck, long wing-feathers, and tail are black, the belly white, the rest slaty gray. It is often called the black goose. It lives on marine plants and small animals. There are twelve other species—e.g. *B. leucopsis* and *B. ruficollis*. See BARNACLE GOOSE, GOOSE.

Brentwood, a market-town in Essex, 10 miles SW. of Chelmsford by rail, stands on an eminence in a well-wooded country. It has a richly endowed grammar-school, founded by Sir Anthony Browne, Chief-justice of England, in 1567. There are remains of an old chapel, dedicated in 1221 to St Thomas à Becket. Pop. 4949.

Brenz, JOHANN, the Reformer of Württemberg, was born 24th June 1499, at Weil, in Swabia, and went in his thirteenth year to study at Heidelberg. From Luther's visit to Heidelberg in 1518 he became his zealous adherent, and after his appointment as a preacher in the imperial free city of Hall, in Swabia (1522), he openly attached himself to the Reformation. He was at the Marburg Disputation in 1529, and the Diet of Augsburg in 1530, and in 1536 was summoned by Duke Ulrich of Württemberg to lead the Reformation there. For his energetic opposition to the Interim of Charles V. he was forced to flee to Stuttgart, where in 1553 he became 'propst' (or superintendent), and died 11th September 1570. Brenz was co-author of the Württemberg Confession of Faith, and his Catechism (1551) has held the next place to that of Luther in Protestant Germany. Eight

volumes of his collected works were published in 1576-90. See his biography by Hartmann (1862).

Brescia, a city of Italy, in Lombardy, 51 miles E. of Milan by rail. It is romantically situated on the rivers Mella and Garza, in a wide fertile plain, at the base of several hills, on the summit of one of which is an old castle formerly known as the Falcon of Lombardy. The city is for the most part regularly built, and besides two cathedrals—the old (dating from the 7th century), and the new (1604-1825)—it has numerous ancient churches, and the Tosi Gallery or Town Museum, adorned with pictures and frescoes, including many by masters of the Venetian school. The old Broletto Palace dates from the 12th century. A valuable public library, the *Biblioteca Quiriniana*, was founded and nobly endowed in 1750 by Cardinal Quirini; it contains 40,000 volumes, with many rare manuscripts. The Temple of Hercules, built by Vespasian, and excavated in 1822, forms a repository for classical antiquities. The cemetery, founded in 1810, is regarded as the finest in Italy. A statue of Arnold (q.v.) of Brescia was unveiled in 1882. Brescia has manufactures of woollens, silk, leather, paper, arms, cutlery, &c., and its wine is of good quality. Brescia, whose old name was *Brixia*, is supposed to have been founded by the Etruscans; it was a town of the Cenomani, and its inhabitants were allied with the Romans when Hannibal crossed the Alps. It was captured by the Huns, and passed through the hands of Lombards, Charlemagne, the Franks, the Germans, and was taken by the French under Gaston de Foix in 1512. The republic of Venice held it till its own downfall in 1797. In March 1849, Brescia, as the only important town opposed to Austrian rule in Lombardy, was besieged by Haynau, and forced to capitulate. The city and province were incorporated with the kingdom of Italy after the war of 1859. Pop. (1892) 66,500.

Breslau, the capital of Prussian Silesia, 150 miles SE. of Frankfort-on-Oder by rail, is situated at the confluence of the Ohlau and Oder, which divides it into two parts, connected by numerous handsome bridges. The fortifications were converted in 1813 into beautiful promenades, and the ditch has been transformed into an ornamental sheet of water. The streets of the new portion of Breslau are spacious and regular, and the houses stately and handsome, affording a pleasant contrast to the sombre, massive structures of the old town. Educational institutions are numerous, including a university founded by the Emperor Leopold I. in 1702, and attended in 1886 by 1436 students. The library contains 300,000 volumes. Besides a cathedral (1148-1680; restored 1875), Breslau has many churches, the most remarkable being the Protestant church dedicated to St Elizabeth, with a steeple 298 feet in height, and a splendid organ; a Jewish synagogue; and a bishop's palace. The other buildings include the Rathaus, the royal palace, now used as government buildings, exchange, barracks, and court-house. Breslau has many hospitals and charitable institutions. The position of Breslau, in the centre of the manufacturing districts of the province, secures it a large trade, which its railway connection with all the important cities on every side, in addition to the facilities of communication which the Oder affords, enables it to turn to the best account. Linen fairs are held, and it is a great wool-mart. It has manufactures of linen, woollens, cotton, silks, lace, jewelry, machines, earthenware, soap, alum, starch, &c., with many distilleries; and a trade in corn, coal, metals, timber, hemp, and flax. Breslau is a city of Slavonic origin, and was for many centuries occupied alternately by the Poles and the

Bohemians. It afterwards passed to Austria, from which it was taken by Frederick II. of Prussia in 1741. Six years afterwards it was captured by the Austrians after a bloody battle, but retaken by Frederick in about a month. From that time until 1814 it was frequently besieged. Since 1890 Breslau is to be made again a first-class fortress by means of detached forts. It is the second city of Prussia, and fifth largest in the empire. Pop. (1870) 207,997; (1885) 299,405; (1890) 335,186 (37 per cent. Catholics, 6 per cent. Jews).

Bressay, one of the Shetland Isles, separated from Lerwick by Bressay Sound. It is 6 miles long, 1 to 3 miles in breadth, and 10½ sq. m. in area. The prevailing rocks are Devonian. Flag and roofing stones are quarried for exportation. The coast is rocky, there are several caverns, and the highest point is 724 feet above sea-level. Pop. 799, most of them fishermen. Bressay Sound is one of the finest natural harbours in the world, and is a rendezvous for herring-boats, and for all whalers and other vessels proceeding north. In its west centre is the harbour of Lerwick with light-house. East of Bressay, and separated from it by a narrow and dangerous sound, is a rocky isle, called Noss, 6 miles in circuit, girt on all sides by perpendicular cliffs, and rising abruptly from the sea to the height of nearly 600 feet, with a flattish top. A detached rock or holm, on the south-east side, in former years communicated with Noss by means of a cradle or wooden chair run on strong ropes stretched across a yawning gulf, and admitting a man with a sheep to be drawn over at a time.

Brest, a strongly fortified city in the department of Finistère, one of the chief naval stations of France, is situated 389 miles by rail W. of Paris, on the north side of the Bay or Road of Brest. One of the finest harbours in Europe, the roadstead is formed by the promontory of Finistère on the north and Kelerun on the south, and is broken up into various bays formed by the mouths of streams as they enter the bay. The only entrance to the bay is by a narrow channel called *Le Goulet*, which is scarcely a mile wide, and is strongly defended by batteries; the difficulty and danger of access to hostile ships being increased by rocks in the middle of the channel. The roadstead from this entrance to the mouth of the Elon is about 6 miles in length. Under Napoleon III. £600,000 was expended on harbour and fortification works, and a further sum of £1,500,000 between 1883 and 1894. The small river Penfeld flows through the town; on its left bank is the town proper, on its right the suburb of *Recouvrance*, connected by a splendid iron swing-bridge (1861), 65 feet high, and 347 long. Brest is, on the whole, irregularly built on an uneven site, and has steep, narrow, dark, and very dirty streets. In some places, communication between the lower and upper parts of the town can be effected only by stairs. The fine promenade known as the *Cours d'Ajot* runs along the shore to the south of the town, and is planted with trees. There are an old castle, an exchange, town-house, naval hospital, lyceum, observatory, and public library. The manufactures include leather, wax-cloth, paper, and rope; the exports are chiefly beer, grain, brandy, and fish. Brest has extensive shipbuilding yards, rope-walks, storehouses, &c.; extensive quays, arsenals, and dry-docks; its industry is chiefly confined to the equipment of the navy in its various branches. It has telegraphic communication with America by a submarine cable. The Bagnes or hulks were closed in 1860, and the prison is now used as a storehouse. The splendid position of Brest made it an object of contention to French, English, and Spaniards. The Count of Leon ceded Brest to the first Duke

of Brittany in 1040; it was given up to the English by Duke John IV. in 1372, but again came into the hands of the dukes; it was held by an English garrison till 1397. Again held by the English, it was retaken by the French, to whom it passed on the marriage of Louis XII. to Anne of Brittany. In 1631 Cardinal Richelieu resolved to make it a naval station, and commenced the fortifications, which were completed by Vauban, but have since been greatly extended. In 1694 the English under Lord Berkeley were repulsed here with great loss. In 1794 the French fleet under Admiral Villaret-Joyeuse was defeated off Brest by the English fleet under Admiral Howe. Pop. (1872) 66,272; (1886) 70,778; (1891) 75,854.

Brest Litovsk (Polish *Brzesc*), a strongly fortified town of the province of Grodno (Russian Poland), on the Bug, commands the intersection of several important railways, being 132 miles ESE. of Warsaw, and 682 miles WSW. of Moscow. It has vast magazines and military stores, and has an extensive trade in its cloth manufactures, Russian leather, soap, and wood. Once the occasional residence of the kings of Poland, it is now the seat of a Greek and an Armenian Catholic bishop. It fell to Russia in 1795. Pop. 45,137.

Bretagne. See BRITTANY.

Brethren. See BROTHERHOODS.

Bretigny, a village in the French department of Eure-et-Loir, 20 miles S. of Paris by rail. Here, in 1360, Edward III. concluded a peace with France, by which John II. of France was released from his captivity in England on agreeing to pay three million crowns for his ransom, whilst England renounced her pretensions to Normandy, Anjou, Maine, and Touraine, and was confirmed in possession of Gascony, Guienne, and several other parts in France, recently acquired by conquest.

Breton, JULES ADOLPHE, born in 1827, the son of the Mayor of Courrières, was educated at St Omer and at Douai, and trained as a painter under Félix Devigne at Ghent, and in Drölling's *atelier* at Paris. The subjects of his earlier pictures, such as 'Misère de Désespoir' (1849), are taken from the French revolutionary period; but he soon turned to the scenes from peasant life which he has treated in a most poetic and suggestive manner, with an admirable union of style with realism. In 1853 he exhibited 'Le Retour des Moissonneurs,' and in 1855 his celebrated 'Les Glaneuses.' He is represented in the Luxembourg by 'La Bénédiction des Blés' (1857), admirable for its rendering of sunlight; 'Le Rappel des Glaneuses' (1859); and 'Le Soir' (1861). His later works are simpler in their component parts and larger in the scale of their figures, and of these 'La Fontaine' is a typical example. Breton is also known as a poet; and his brother and pupil, Émile Adélaide Breton, is a distinguished landscape-painter.

Breton de los Herreros, DON MANUEL, Spanish dramatist, was born in 1800 at Quel, in the province of Logroño, and served as a volunteer in the army from 1814 to 1822. Subsequently he held several government offices, but was always losing them—finally in 1840—on account of his expression of Liberal opinion. He died at Madrid, 13th November 1873. His poems fill 5 vols. (Madrid, 1850-52), and a selection appeared at Paris in 1875. He brought out upwards of 150 pieces, partly original, partly adaptations from the older Spanish classics, and partly translations from the Italian and French, most of which have been highly popular. Indeed, Señor Riaño says, 'he was unrivalled in Spain in the comic situations of his plays, in originality, in the delicacy with which he copied the types of the middle classes, the facility with which

he versified his dialogues, and his extraordinary fecundity.'

Bretschneider, HEINRICH GOTTFRIED VON, a satirist, of unsettled life and eccentric habits, born at Gera in 1739, from the Moravian Institute at Elbersdorf passed to the Gymnasium at Gera, and at seventeen entered the army. In 1778 he became librarian to the university of Ofen (Buda), and in 1782 Joseph II. gave him a government appointment. He died in 1810. Of his numerous works, including plays and poems, the chief are his satires, *Almanach der Heiligen auf 1788* and *Wallers Leben und Sitten* (1793).

Bretschneider, KARL GOTTLIEB, a distinguished German theologian, born 11th February 1776, at Gersdorf, in Saxony, studied theology at Leipzig, was appointed pastor at Schneeberg in 1807, general superintendent at Gotha in 1816, and afterwards councillor of the Upper Consistory there. He died at Gotha, 22d January 1848. Bretschneider established a reputation as a sound and judicious thinker of rationalistic bias, and his theological writings are admitted to have a permanent value. In 1820 appeared his *Probabilia de Evangelii et Epistolarum Johannis Apostoli Indole et Origine*, an attack upon the Johannine authorship from internal evidence, and in 1824 his *Lexicon Manuale Græco-Latinum in Libros Novi Testamenti*. Another work of importance is his *Handbuch der Dogmatik* (4th ed. 1838). Besides these, Bretschneider wrote on various theological questions and controversies. An autobiography was published at Gotha in 1851.

Bretten, a town of Baden, the birthplace of Melancthon, 16 miles ENE. of Karlsruhe by rail. The house in which the Reformer was born belongs now to a foundation bearing his name for the support of poor students, established in 1861. A monument was erected in 1867. Pop. 4020.

Bretts and Scots, THE LAWS OF THE (Lat. *Leges inter Brettos et Scotos*), the name given in the 13th century to a code of laws in use among the Celtic tribes in Scotland. The 'Scots' were the Celtic people dwelling in the western and more mountainous districts north of the Forth and the Clyde, who, when it became necessary to distinguish them from the Teutonic inhabitants of the low country, received the names of 'the Wild Scots,' 'the Irishry of Scotland,' and, more recently, 'the Scotch Highlanders.' The 'Bretts' were the remains of the British or Welsh people, who were at one time the sole or chief inhabitants of the region now divided into the shires of Dumbarton, Renfrew, Ayr, Lanark, Peebles, Selkirk, Roxburgh, Dumfries, and Cumberland. This province was for some centuries an independent kingdom, known by the names of 'Cumbria' and 'Strathclyde.' It became about the middle of the 10th century a tributary principality held of the king of the English, by the heir of the king of the Scots. It so continued till after the beginning of the 12th century, when Cumberland having been incorporated with England, the gradual absorption of the rest of the territory into the dominions of the king of the Scots seems to have been imperceptibly completed. The last 'Prince of Cumbria' named in record was the brother and heir of Alexander I. of Scotland, 'the Earl David,' as he was called, who, on his brother's death in 1124, himself became king of the Scots. No more is heard of Cumbria as a principality; but 'the Welsh' continue to be named among its inhabitants, in the charters of King David's grandsons—Malcolm the Maiden (1153-65), and William the Lion (1165-1214). And they seem to have retained more or less of their ancient Celtic laws until after the beginning of the 14th century. It was not until the year

1305 that an ordinance of Edward I. of England, who appeared then to have reduced all Scotland to his subjection, decreed 'that the usages of the Scots and the Bretts be abolished, and no more used.' It is unknown how far this prohibition took effect. Of the code which it proscribed, only a fragment has been preserved. It was printed by Sir John Skene, in his *Regiam Majestatem* (1609); and by Thomas Thomson and Cosmo Innes, in the *Acts of the Parliaments of Scotland*, vol. i. (1844), where the laws are given in three languages—Latin, French, and English. The French version, which is the oldest, is printed from a manuscript of about 1270, formerly in the public library at Bern, in Switzerland, now in the Register House at Edinburgh. The fragment of the 'laws of the Bretts and the Scots' thus published, is of much the same nature as the ancient laws of the Anglo-Saxons, the Welsh, the Irish, and other nations of Western Europe. It fixes the *cro*, or price at which every man was valued, according to his degree, from the king down to the churl, and which, if he were slain, was to be paid to his kindred by the homicide or his kindred. The *cro* of the king was 1000 cows; of the king's son, or of an earl, 150 cows; of an earl's son, or of athane, 100 cows; of a thane's son, 66½ cows; of the nephew of a thane, or of an oghthiern, 44 cows and 21½ pence; and of a villain or churl, 16 cows—all persons of lower birth than a thane's nephew or an oghthiern being accounted villains or churls. The *cro* of the married woman was less by a third than the *cro* of her husband. The *cro* of the unmarried woman was as much as the *cro* of her brother. A chapter 'of blood-drawing'—corresponding with the *blod-wyrt* of the English—fixes the fine to be paid for a blow to the effusion of blood, according to the degree of the person wounded and the place of the wound.

Bretwalda, a title of supremacy among the early Anglo-Saxon kings, the exact signification and history of which are highly uncertain. The *Anglo-Saxon Chronicle* says of Egbert, 'and he was the eighth king that was *Bretwalda*,' and the word only occurs elsewhere in an English and Latin charter of Athelstan in 934, in which that king is styled 'King of the Anglo-Saxons and *Brytenu-wallda* of all the island.' Palgrave attempted to explain the title as 'wielder of Britain,' an honour to which the most powerful king was elected, and which was substantially an assertion of a kind of continuity with the old Roman imperial power within the island. Kemble explained the word as merely 'wide ruler' (*bryten*, 'broad'), and ridiculed the idea of any kind of federation and elective hegemony among the early English kings. Freeman inclines to 'an intermediate position between Kemble and Palgrave,' but refuses to admit the idea of Roman influence, maintaining that the institution was of purely English growth. See note B to vol. i. of Freeman's *Norman Conquest*.

Breughel, PETER, the founder of a family of Dutch painters, was born in the village of Breughel, near Breda, in 1510 (or, as others say, 1530), and died at Brussels in 1569. After travelling through Italy and France, he fixed his residence at Antwerp, where he was elected to the Academy. He painted chiefly the pleasures of rustic life, which he transferred to his canvas with vivid colouring, and at times unnecessary coarseness. His son, PETER, distinguished by the strange title 'Hellish Breughel'—because he loved to paint scenes in which the leading characters were devils, hags, or robbers—was born about 1559, and died 1637.—JAN, brother of the preceding, usually called 'Velvet Breughel,' from his rich dress, was born in 1569, and died in 1625. He was chiefly a flower painter, but was

also distinguished for his landscapes and for his minute finish of small figures. He painted several works in concert with Rubens, who supplied the chief figures.—Other members of the same family attained to some note, in most cases as painters of still-life. See monograph by Michel (Paris, 1892).

Breve, a note in Music. The name was originally applied to the shortest of the three notes used in early music, but is now appropriated to the longest note met with, and it occurs but seldom, except in church music, modern music being divided into bars which usually fall short of it in length. It has the time-value of two semibreves, and was formerly written thus, \equiv , now \circ or \bigcirc . The expression *alla breve* at the beginning of a piece—also denoted by the vertical stroke through the sign of common time, C —signifies that the time-value of the notes is reduced to one-half.

Breve, or BRIEVE, in the practice of the Scots law, is a writ issuing from Chancery in the name of the crown, to a judge, ordering him to try by jury the points or questions stated in the breve. In ancient times these writs appear to have been the foundation of almost all civil actions in Scotland; but latterly they have been used only in the following cases: (1) Breve of Inquest, now, however, superseded by a petition of service to the sheriff to ascertain the heir of a deceased person. (2) Breve of Tutorry, the purpose of which is the appointment, as guardian to a pupil, of the nearest agnate or person most nearly related through the father, of lawful age. (3) Breves of Idiocy and Furosy, for the appointment, in case of ascertained insanity, of the nearest male agnate, of lawful age, as guardian or curator. Proceedings 2 and 3, however, are much superseded by the appointment of judicial officers. (4) Breve of Terce to enable a widow to recover her terce or dower. It is issued to the sheriff of the county, who divides the possession of the land between the widow and the heir (see TERCE). (5) Breve of Division amongst heirs-portioners. By means of this breve an heir-portioner—i.e. one of two or more sisters succeeding in equal portions to a landed estate—may have her share of the lands separated or set apart by a judge, who appoints an inquest, or jury of fifteen persons. An arbitration or ordinary action is now more generally resorted to. See HEIRS-PORTIONERS.

Brevet (Fr., 'a writ' or 'warrant'), in the British army, is a promotion of officers by selection to a higher rank irrespective of there being any vacancies in its established numbers. A general promotion by brevet used formerly to be made once in about six years; but more recently it was limited to very special occasions, as a coronation, the birth of an heir to the throne, the termination of some great war, &c., and given only to officers who had some particular claim to promotion. A brevet was determined on by the cabinet, and carried out by the commander-in-chief. It had formed part of the British military system ever since the time of James II.; but it was unsatisfactory, because the flow of promotion caused by it was arbitrary, uncertain, and much liable to abuse. There were brevets in 1837, 1838, 1841, 1846, 1851, and 1854, some of all ranks, from lieutenant-general to captain, receiving promotion. On one of these occasions, 200 colonels were at once made major-generals. The increase of pay following their promotions was in 1837 £11,000; in 1838, £7000; in 1841, £15,000; and in 1846, £21,000, &c.; but it must not be forgotten that death and sales had in the intervals cleared off perhaps an equal number of officers at the higher rates of pay. In 1854 the new major-generals alone involved an additional charge of £18,000 a

year. In that year general brevets were abolished—a fixed establishment of general officers being substituted; but individual brevets were still given to field-officers after five years' service in each rank, and to all officers, except subalterns, for distinguished service in the field. This promotion carried with it the higher rate of pay, but was neither purchasable nor saleable. It has never been given to officers below the rank of captain, and now (1888) is only conferred for distinguished service. The holder retains his place and rank in his regiment if it is alone, but if acting with other troops he will take command of the whole force, provided that he is senior by brevet, or, as it is called, 'army' rank, to the other officers. This rule has been known to cause a change of command in the middle of an operation, which, on active service, is very undesirable. The official title of an officer holding brevet rank is captain and brevet-major, or major and brevet-lieutenant-colonel, or lieutenant-colonel and brevet-colonel, as the case may be; but an officer may have as many as three brevets, and be a captain and brevet-colonel. All colonels are placed on a seniority list for promotion to major-general, so that it is possible by means of brevets to greatly accelerate the promotion of a deserving officer to that rank.

There is no brevet promotion in the navy.

In the United States, brevet rank does not entitle the holder to the higher rate of pay, nor to corresponding rank, except under special circumstances defined by law.

Breviary. By this word Roman Catholics understand the book which contains all the ordinary and daily services of their church except (a) those connected with the celebration of the Eucharist, which are contained in the *Missal*, and (b) those for special occasions, such as baptisms, marriages, ordinations, funerals, &c., which are contained in the *Ritual* or *Pontifical*, according as they fall within the sphere of ordinary priests or of bishops. In the Established Church of England, therefore, the breviary would be exactly represented by a Prayer-book containing, after the preface, tables, &c., the morning and evening prayer, litany, Athanasian creed, collects, psalter, and all the lessons for every day in the year, with the addition of a complete set of hymns for the different occasions. What is called a 'Church Service,' with *Hymns Ancient and Modern* bound in, is, in fact, a breviary, only differing from the contents of the Latin one in the fact that it provides only for Sundays and holidays, that the hymns are more or less left to selection, and that it contains the Eucharistic and occasional offices in addition. The word breviary is colloquially applied by Latin-Catholics to the corresponding portion of the services of the Oriental churches—e.g. one may hear the remark that the services of the Greek breviary are very long, or those of the Coptic breviary very unchanging—but the present article deals only with Latin breviaries.

The word itself signifies an *abbreviation* or *summary*, and is used to indicate that the book is a *compilation* designed to obviate the necessity of using several different books in the same service, that is to say, a separate book for the prayers, a hymn-book, a Bible from which to read the lessons and Psalms, copies of the Fathers from which to read the homilies, &c. An Anglican *Church Service* is a compilation on exactly the same principle and for the same object, as well as very similar in contents. The origin of the different hours of prayer during the day, which is undoubtedly older than Christianity, and adopted by the church from the synagogue, is beyond the scope of this article, as are also the changes and modifications which they have undergone. The

compilation called the breviary is believed to owe its origin to Gregory VII. in the 11th century. It underwent several changes under succeeding popes, and in 1536 Francis, Cardinal de Quiñones, a Spaniard, published at Rome a reformed breviary which had the approval of Clement VII. and Paul III. It was, at least in the earlier editions, perhaps too sweeping in its changes, but is of great merit, insuring the reading of the whole Book of Psalms every week, and of almost all the New Testament and a great part of the Old every year. It is upon this work that the daily service of the English Established Church is largely modelled, some parts of the preface being embodied entire in that of the Book of Common Prayer. The use of this breviary was never made compulsory, but while it was permitted as a substitute for the unreformed breviary, it was very widely adopted both for public and private worship. It was, however, considered that its services were both too short and too divergent from ancient custom, and Pius V., in conformity with a decree of the Council of Trent, issued in 1568 a reformed edition of the old Roman breviary, which he imposed absolutely upon all the Latin churches, to the exclusion of the breviary of Quiñones, and of all other breviaries which did not possess an antiquity of 200 years. This breviary was further altered by Clement VIII. and Urban VIII., the latter of whom, with deplorable taste, made a series of changes in the texts of the hymns which has been most disastrous to both the literary merit and the historical interest of these poems. The breviary has since undergone many other modifications, chiefly by the addition to the calendar of great numbers of feast-days in honour of saints, to such an extent that the ordinary service of a week-day became very uncommon. Finally, in 1883 Pope Leo XIII. permitted, though not commanded, the substitution for the week-day service, upon almost every day in the year, of a voluntary office of a festal character according to the day of the week. The state to which the practical use of the breviary has thus been reduced, especially by the virtual abrogation of the weekly reading of the whole Book of Psalms, which is, in theory, its main intention, is now acknowledged on all hands to call for a new and sweeping reform. This reform will probably follow, at least in this respect, the lines of the reformed breviary of Cardinal de Quiñones. It may be regarded as imminent, and had the sittings of the Vatican Council been continued, would very likely have taken place before now.

The exception made by Pius V. would have spared some at least of the old English breviaries, but owing chiefly to the English Roman Catholic clergy being educated abroad in the 16th, 17th, and 18th centuries, their use has become extinct. Great numbers of new breviaries were, however, brought into use in France in different dioceses in the 17th and 18th centuries. These are generally works compiled with great care and learning. They are mainly distinguished for an exclusive use of scriptural phrases, an intense nationalism, the substitution for early and medieval hymns of compositions written in imitation of Horace by French scholars, and certain indications of a leaning to the doctrines of Jansenism. They are now almost, if not entirely, extinct, the Roman breviary having been adopted in their stead. The principal Latin breviaries at present in use, other than the Roman, are the Monastic, used by all the male and female disciples of St Benedict—i.e. by all monks and nuns properly so called; the Dominican, used by all disciples of St Dominic; the Ambrosian, in the ecclesiastical province of Milan; and the Mozarabic, the original national rite of Spain, in use in part of the cathedral and city of Toledo.

What here follows will relate only to the Roman breviary. It is to be observed at the same time, that wherever the Roman breviary has been introduced, it has been subjected to additions to the calendar and other changes, so as to give it a local or national colour. In England, for instance, there are about seventy days in the year—without reckoning others within octaves, alterations in importance, or changes of date—upon which the service differs from the text of the Roman breviary.

After the general rubrics, tables to find Easter, calendar, &c., the body of the breviary is divided into five parts. The first of these consists of the Book of Psalms arranged in sections, with the daily prayers and some hymns, for the different services of the day and week. The first of these is *Matins*, which properly belongs to midnight, but is usually said in Italy about 7.30 or 8 A.M. In France, on the contrary, it is usual to forestall it on the preceding evening. It consists of Psalm xev. (*Venite*) and a hymn, followed by one or three sections called *Nocturna* or *Watches of the Night*. On Sundays there are three of these, the first containing twelve psalms, and each of the others three. At the end of each is read a lesson, divided into three portions, whence the whole are counted as nine. The first reading is from Scripture, the second from one of the Fathers, and the third from one of the Fathers, on the gospel which will later be read at mass. The *Te Deum* usually follows. On week-days there is only one *Nocturna* of twelve psalms, and one lesson (three), all from Scripture. The second daily service is *Lauds* or the *Morning Praises*, theoretically proper to sunrise. It consists of four psalms, a Scripture canticle, Psalm cxlviii., cxlix., and cl., a hymn, the *Benedictus* or Thanksgiving of Zacharias (Luke, i. 68-79), and prayers. The succeeding services, or *Little Day Hours*, are *Prime* or the *First Hour* (6 A.M.), *Terce* or the *Third Hour* (9 A.M.), *Seut* or the *Sixth Hour* (noon), and *None* or the *Ninth Hour* (3 P.M.). They are all alike, consisting of a hymn and some sections of Psalm cxix. (Vulgate cxviii.), followed by a prayer. Prime differs a little from the others, being susceptible of some extra and changing psalms, and on Sundays of the creed of St Athanasius, and containing special prayers for the morning; in choirs a lesson is also read at it taken from the Martyrology. *Vespers* or *Evening Song* is theoretically proper to sunset, and is reckoned to begin the next day, according to the eastern reckoning—'The evening and the morning were the — day.' It consists of five psalms, which vary according to the day of the week, a hymn, the *Magnificat* or Thanksgiving of the Blessed Virgin (Luke, i. 46-55), and prayers. *Completorium* or *Compline*, 'the completing service,' belongs theoretically to 9 P.M., and is a supplication for protection during the night. It is always the same, consisting of the general confession, four unvarying psalms, a hymn, the *Nunc Dimittis* or Song of Simeon (Luke, ii. 29-32), prayers, and a Commemoration of the Blessed Virgin. The unchanging character of this and of the Little Hours conveys no idea of the practical monotony from day to day. This arises from the multiplication of festivals of saints already spoken of. These have, practically speaking, always got special psalms, which are always the same at lauds, and vary very little at vespers and matins. Hence, as a matter of fact, about fifty or sixty psalms are repeated constantly, and the others rarely or never.

The second part of the breviary consists of what is called the *Proprium de Tempore*. This means the whole service for Sundays and week-days as dependent upon Christmas and Easter. It contains the homilies of the Fathers, hymns, &c. for the whole year, as far as so dependent, but is

mainly occupied by the course of daily scripture-reading. This consists of selected extracts averaging about 20 verses a day. Roughly speaking, Isaiah is read in Advent (the three or four weeks preceding Christmas), the epistles of St Paul from the Epiphany (January 6) till Septuagesima (the ninth Sunday before Easter), when Genesis is begun, but broken off at chapter xiv. on Shrove Tuesday. Homilies, not Scripture, are read in Lent, except on feasts of saints, and then the Scripture is special, but Genesis continues to be read on Sundays, and a small portion of Jeremiah and Lamentations in the last fortnight. A week after Easter the Catholic Epistles and Apocalypse are begun and read till Whitsunday. A week after Whitsunday, Samuel and Kings are begun, and read till the beginning of August. At that date Proverbs are begun, and followed by Ecclesiastes, Wisdom, Ecclesiasticus, Job, Tobit, Judith, Esther, both books of Maccabees, and the rest of the Prophets. The weakness of this arrangement, besides the scantiness and scrappiness of the extracts, is in the omission of so much, including entire books and the greater part of the Pentateuch. It forms, however, a kind of imperfect epitome of scriptural history, and a limited course of scriptural reading.

The third part of the breviary consists of what is called the *Proprium Sanctorum*, or special offices of saints. This consists of whatever is special to any day fixed by the day of the month. The greater part of it as regards bulk is occupied by summaries of saints' lives, exactly like articles in a biographical dictionary. This is certainly the weakest part of the breviary, and is accordingly always selected as the point for controversial attack. Although sometimes drawn up with care, and often altered—as has been done by Leo XIII. among others—to keep them abreast of historical criticism, the biographical notices are open to the charge of occasional inaccuracies in matters of fact. A notion sometimes obtains among Protestants that Roman Catholics are obliged to believe these biographies. This is wholly baseless. No such idea exists even as a superstition. As these notices embrace the lives of a very great number of persons of religious eminence, of all nations, ages, and conditions, they form a sort of imperfect epitome of church history, just as the Scripture readings form one of Scripture.

The fourth part of the breviary is called the *Commune Sanctorum*. These are a series of twelve offices for festivals of saints according to the class to which he or she may belong. They are for (1) the eves of apostles; (2) the feasts of any martyrs, including apostles, within the season from Easter to Pentecost; (3) apostles and evangelists; (4) a single male martyr; (5) a group of several martyrs; (6) a canonised bishop not a martyr, technically styled *confessor*, as having confessed Christ before men, though not by death; (7) a confessor not a bishop—i.e. a priest or layman; (8) doctors of the church—i.e. certain eminent theologians, but this differs little from 6 or 7; (9) virgins, divided into martyred and not martyred—the latter are mainly canonised nuns; (10) other women; (11) dedication festivals of churches; (12) the Blessed Virgin Mary. The *Commune Sanctorum* is the most used of any part of the breviary. In fact, the service from day to day usually consists of 4, 6, 7, and 9, with occasional changes to 2, 3, 5, and 12. All these have special psalms, which differ little, 6, 7, and 8 being absolutely the same, as also 9, 10, and 12, and 2 having the psalms of 3, 4, or 5. The festal office is a good deal shorter than others, a circumstance which probably accounts for a good deal of its multiplication. There are three *Nocturne* at matins, with only three psalms in each. At the

end of the first are read the lessons from Scripture, which are usually those of the day from the *Proprium de Tempore*, as only festivals of some importance have special Scripture lessons; at the end of the second is read the biographical notice; at the end of the third, a homily on the gospel. These lessons of the third Nocturn, which are often most striking and powerful passages from the greatest writers of the early church, vary a good deal, and form, along with those of the *Proprium de Tempore*, a sort of imperfect epitome of theology, as those of the first Nocturn do of Scripture, and those of the second, of church history.

The fifth part of the breviary consists of extra services, the principal of which are the vespers (*placebo*), and matins, and lauds (*dirge*) of the dead, and the Little Office of the Blessed Virgin Mary. None of these extra services are ever obligatory, except that of the dead on All-Souls' Day. It is funeral in character, and is mainly used at funerals, anniversaries of deaths, &c. The Little Office of the Blessed Virgin is a sort of abbreviated festal office of the Blessed Virgin, with only one Nocturn. It contains 31 psalms daily, with 4 canticles, hymns, prayers, &c., and is very widely used by itself among the laity and the active religious orders.

Notwithstanding the weaknesses of its scriptural course of reading and its biographical notices, and the practical monotony caused by the multiplication of festal offices, the breviary forms a marvellous mine of powerful and tender religious thought, amassed by the devotional experience of ages. It must be remembered that at every separate service, nearly all, or by far the largest part of the matter used, is the language of Scripture, a circumstance which invests the office with great grandeur and vitality. The readings form a sort of storehouse, albeit imperfect, of scriptural, historical, and theological knowledge. Exquisitely chosen quotations or adaptations of Scripture also enter largely into what are among the most striking passages of the breviary—viz. the *Invitatories* or exhortations to worship joined to the *Venite*, the *Antiphons* or anthems attached to the psalms and canticles, the *Short Responsories* which precede the prayers at the little hours and compline, and above all, the responsories by which each section of the lesson at the end of each nocturn is followed. These are always poetical, generally beautiful, and not unfrequently rise to the sublime.

The rules for arranging the service for every day, and especially for uniting and harmonising the *Proprium de Tempore* with the *Proprium Sanctorum*, are contained in the general rubrics, and fill 37 chapters. Being printed in black, with the quotations and technical words in red, these pages present a motley appearance, which has obtained for them the technical name of the *Pica* or *Pic* (cf. *maggie*, *piebald*). The rules are so complicated that it would be almost impossible for any one to find the service for himself upon the spur of the moment, upon any given day. This difficulty is accordingly met by the publication in every separate country or diocese of a sort of annual almanac, called the *Ordo Recitandi Divini Officii*, which contains under every day, clothed in a mass of technical contractions, minute directions as to what is to be read.

The breviary is sometimes to be met with in one bulky volume, in which case it is called a *Totum*; sometimes, especially in Spain, in two; but most frequently in four, for spring, summer, autumn, and winter, in which case each volume contains the Psalms, a quarter of the *Proprium de Tempore*, about a third of the *Proprium Sanctorum*, and the whole of the *Commune Sanctorum* and the additional matter.

The duty of publicly joining in or privately reading aloud—i.e. so as to utter every word with the lips—the whole of the breviary services every day, is incumbent upon all clerks in holy orders, all members of religious orders, male or female, and every person holding a benefice (such as a prebend) to which attendance in choir is normally attached. The serving brethren or sisters in religious orders, and the members of active religious orders, such as sisters of charity, form an exception, but these are always bound to some shorter substitute, such as the Little Office of the Blessed Virgin, a similar office in praise of the Blessed Sacrament, or the like. In all properly conducted cathedral and collegiate churches, the service is performed publicly every day with surpliced choir, &c., as in similar institutions in the English Established Church; the ceremonial is also similar, except that, if the service is choral, incense is offered during the *Benedictus* and *Magnificat*. For this purpose the services are usually massed together, as matins and lauds at 7.30 or 8 A.M., prime, terce (after which high mass is sung), sext, and none, at 9.30 or 10, and vespers and compline at 4. The time consumed varies, principally according to the amount of music used. A person reading alone and pronouncing rapidly can read the whole of the services of the day through in about two hours, or even less. In the cathedral of Seville, on the other hand, where the entire daily service is sung with the utmost pomp and solemnity, and with the addition of generally two, often three, and sometimes four high masses, as many as eight hours are often spent in choir.

The use of the breviary as a book of private devotion by laymen has become rare since the invention of printing has led to the multiplication of devotional works of different kinds, but at present seems to show some tendency again to increase, and it has always been a common custom to sing vespers or compline, at least on Sundays, in parochial and other public churches. For this reason, most Roman Catholic manuals of devotion contain compline and the more common psalms of vespers. Spanish prayer-books usually contain the ordinary forms of all the services except matins; and in that country the singing of such services in the parochial churches, and the participation of the laity in them, is more common than elsewhere. This seems to have been the case in England before the Reformation, the laity also habitually attending matins. The Parisian breviary of 1737 was translated into French under the title of the *Breviaire Français*; and there is likewise a French version of the Roman breviary. The latter has also been translated into German; and an English version was published by the present writer in 1879. See Pierre Batifol, *Histoire du Bréviaire Romain* (1893).

Brevipennes (Lat., 'short-winged'), an obsolete name, applied by Cuvier to the running-birds like ostrich, rhea, and emu, in which the wings are rudimentary. See BIRD (p. 173), OSTRICH, &c.

Brewer, JOHN SHERREN, born at Norwich in 1810, graduated with classical honours at Queen's College, Oxford, in 1833, took orders, and was appointed professor of English in King's College, London, in 1841. For nearly twenty years he laboured in the Record-office, editing the *Monumenta Franciscana* (1858); the *Opus Tertium* and *Opus Minus* of Roger Bacon (1859); vols. i.-iii. of *The Works of Giraldus Cambrensis* (1861); the *Calendar of the Carew Papers* (1861), with the aid of Mr Bullen; and vols. i.-iv. of the *Calendar of Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII.* (1862-72). As an editor, Brewer possessed patient industry and a rare sense

of order, besides marvellously sound judgment and extensive knowledge. His essays and reviews in *English Studies*, edited by Dr Wace, with a brief biography (1880), reveal his vast knowledge and his broad sympathies, as well as a delicacy of touch and a fineness of literary insight seldom found in the laborious student. Brewster was elected Honorary Fellow of Queen's College in 1870, and in 1877 was presented to the living of Toppesfield, in Essex, where he died February 16, 1879.

Brewing. See BEER.

Brewster. SIR DAVID, an eminent Scottish natural philosopher, was born at Jedburgh, December 11, 1781. From the early age of twelve he was educated for the Church of Scotland at the university of Edinburgh, where he highly distinguished himself. A constitutional nervousness disinclining him for a clerical life, he became editor in 1802 of the *Edinburgh Magazine*, and in 1808 of the *Edinburgh Encyclopedia*, to which he contributed many important scientific articles. Previous to this he had entered deeply on the study of optics, with which his name is now enduringly associated. The beautiful scientific toy called the kaleidoscope was invented by him in 1816, and many years after he improved Wheatstone's cumbersome stereoscope by the introduction of lenses, and produced the lenticular instrument now in use. In 1819 the *Edinburgh Philosophical Journal* took the place of the *Magazine*; and in 1831 Brewster was one of the chief originators of the British Association. In 1815 he was elected a Fellow and Copley medallist of the Royal Society; in 1816 he received half the prize bestowed by the French Institute; in 1818 the Royal Society awarded him the Rumford gold and silver medals for his discoveries on the polarisation of light; in 1825 he became corresponding member of the Institute of France; in 1832 he was knighted, and had a pension conferred upon him; in 1838 he was appointed principal of the united colleges of St Salvador and St Leonard, St Andrews; in 1849 he was elected one of the eight Foreign Associates of the French Institute; he was also a member of the academies of St Petersburg, Berlin, Copenhagen, and Stockholm. In 1859 he was chosen principal of Edinburgh University, and filled this post until within a few months of his death at Allerly, Melrose, February 10, 1868. He made important discoveries in every branch of the great subject of polarisation, and in most departments of optics, dealt with optical illusions, the colour of mother-of-pearl, fringes of colour, the optical properties of innumerable substances, biaxial crystals, dichroism, the absorption of light, phosphorescence, fluorescence, photography, and the value of combinations of lenses. The most immediate practical result of Brewster's discoveries was the introduction to British lighthouses of the dioptric system, the honour of having elaborated which he shared with Fresnel. He resolutely maintained his own theory of the three primary colours, and never fully accepted the undulatory theory of light. It has been said that he wrote with the calm decision of a philosopher, the vivid imagination of a poet, and the fervour of a preacher. In 1822 he edited Legendre's *Geometry*, translated by Thomas Carlyle. His *Life of Newton*, first published in 1828 in the Family Library, was issued in a totally new and greatly enlarged form in 1855. Among his other works are his interesting *Letters on Natural Magic*, addressed to Sir Walter Scott; *More Worlds than One* (1854); his treatises on the Kaleidoscope and on Optics (*Cabinet Cyclopaedia*); his *Martyrs of Science*; and his treatises in the 7th and 8th editions of the *Encyclopedia Britannica* on Electricity, Magnetism, Optics, the

Stereoscope, &c. He also contributed largely to the *Edinburgh and North British Reviews*, and communicated hundreds of papers on scientific subjects to the transactions of learned bodies and to scientific journals. See *Home Life of Brewster*, by his daughter, Mrs Gordon (1869).

Brezowa, a market-town of Hungary, 20 miles NW. of Leopoldstadt. Pop. 5549.

Brian, a famous king of Ireland, the Brian Boromhe or Boru ('Brian of the tribute') of the old Irish historians. He succeeded his elder brother as chief of the Dal Cais, on the murder of the latter in 976, and after much fighting, made himself king of Cashel two years later. After establishing his rule over all Munster, he marched into Leinster, and was acknowledged as king by its chiefs in 984. King Brian supported a rude but princely state at his chief castle at Cenn Coradhl, near the modern town of Killaloe, and he had also seats at Tara and Cashel. He formed an alliance with Maelsechlainn Mac Domhnaill, chief king of Ireland, crushed with his help an outbreak of the Leinster men in 1000, next made terms with the Danes of Dublin, and with their help overpowered his late ally, compelled him to give him hostages, and thus made himself chief king of Ireland. He next carried his conquering sword to the west, subdued the Connaughtmen, and in their turn the men of the north. After mauling from Meath to Armagh, he made a circuit of Ireland, taking hostages from all the territories through which he passed. Thus he had become Ardrigh na Erenn, chief king of Ireland, and such he remained until his death. In 1013 war broke out again with the Danes of Dublin, who found some Irish allies. The great struggle took place at Clontarf, on the north side of Dublin Bay. The Danes were routed with great slaughter, never again to recover their strength in Ireland; but the aged hero perished in the battle, April 23, 1014. In his lifetime he had defeated the Danes in no less than twenty-five battles.

Brianchon, CHARLES JULIEN, French mathematician, was born at Sèvres in 1783. Besides some important papers contributed to French mathematical journals, he has left small treatises on lines of the second order (1817), and the application of the theory of transversals (1818). He is best known by a theorem, the correlative of Pascal's, which he published in 1806. The theorem is, If a hexagon is circumscribed to a conic, the straight lines joining the three pairs of opposite vertices are concurrent. He died in 1864.

Briançon (ancient *Brigantium*), a town in the French department of Hautes-Alpes, 162 miles NNE. of Marseilles by rail, on the right bank of the Durance, which is here spanned by a bridge of a single arch 130 feet wide. It is the highest town in France, being situated at an elevation of 4330 feet above the sea-level. As the principal arsenal and dépôt of the French Alps, it is so strongly fortified as to be deemed impregnable. There is some transit trade. Pop. 3638.

Briansk, a trading town of Russia, on the Desna, 77 miles W. of Orel by rail, with iron and glass works, &c. Pop. 20,203.

Briar. See ROSE.

Briare, a town in the French department of Loiret, on the Loire, 102 miles SSE. of Paris by rail. The Canal de Briare (35 miles long), which unites the Loire and the Seine, was the first constructed in France (1642). Pop. 5651.

Briareus (also called *Egeon*), in Greek Mythology the son of Uranus and Gæa, who, like his two brothers, had a hundred hands and fifty heads. He fought for the gods against the Titans (q.v.).

Briar-root, a fine hard wood obtained from the roots of a species of very large heath (*Erica arborea*) which grows in the Pyrenees, in Corsica, and in Algeria. It is largely used for tobacco-pipes. The name is a corruption of the French *bruyère* ('heath'), and has nothing to do with *briar*.

Bribery, as a system affecting all social relations, is best exemplified among oriental nations and in Russia. It forms a serious difficulty for government in the latter country. In Great Britain, although the system of commissions and promotion-money has been carried to great lengths, it cannot be said that there is any general corruption in either private or public life. Formerly, however, and especially during the 18th century, parliamentary corruption was a serious abuse. Developed in the reign of Charles II., when king and ministers and opposition alike received bribes from Louis XIV., it was reduced to a system by Sir Robert Walpole, in whose day the votes of electors were regularly bought, and often those of members of parliament. Indirect considerations also, though not always expressed in money, seriously prejudiced appointments to the public service and the administration of justice. In all these matters, however, there is now something approaching to purity. Statutes were passed in 1729, 1809, 1842, and 1854. The committees of parliament never did justice to the petitions against returns obtained by bribery and other corrupt practices; and accordingly in 1868 the jurisdiction in such cases was given to the judges of the Superior Courts with the best results. The Ballot Act tended further to starve out the coarser forms of bribery, because of the uncertainty whether the money produced any result. Convictions of agents of good standing, and severe sentences upon them, and the wholesale disfranchisement of constituencies proved to be specially corrupt, had a wholesome influence in the same direction. The heaviest blow, however, directed against bribery was Sir Henry James's Corrupt Practices Act of 1883, the most important part of which limits the legal expenditure of the candidate and his agents to a certain sum calculated on the number of electors, and visits with heavy penalties any authorised expenditure beyond this limit, or any unauthorised expenditure of any description; and this altogether irrespective of the purpose for which the expenditure was incurred. Bribery may be committed before, during, or after the election, if the payment can be connected with the election. Bribery may consist of a promise to give refreshment, to pay travelling expenses, to procure an office, to supply money for any of these purposes, or indeed to give or offer any valuable consideration for the purpose of corrupting the mind of the elector. Loans and large charitable payments, the employment of electors, even giving a holiday to workmen without deducting wages, may, in certain circumstances, amount to bribery. If it appears that the candidate or any of his agents have been guilty of bribery, or that bribery (though not traced to any one) has taken place on a large scale, the election is void, and the persons guilty may be punished by imprisonment or fine, electoral incapacity, and incapacity to be elected to parliament or any public office. The imprisonment is limited to one year, and the fine to £200. The civil incapacity lasts for seven years. If bribery is brought home to the knowledge of the candidate, he may be declared incapable of ever representing the particular constituency; and bribery by agents will exclude the candidate from that constituency for seven years.

BRIBERY IN MUNICIPAL ELECTIONS.—By the Corrupt Practices (Municipal Elections) Act, 1884, the offence of bribery in England is put on the

same footing as in parliamentary elections. This does not apply to municipal elections in Scotland, but the common law applies to these and all other elections, such as those of parochial boards.

BRIBERY OF CUSTOM-HOUSE AND EXCISE OFFICERS.—By the Customs Consolidation Act, the 16 and 17 Vict. chap. 107, sect. 262, every person who shall give or offer any bribe, or make any collusive agreement with any officer of Customs or Excise, or other person employed for the prevention of smuggling, in order to induce him to neglect his duty, shall forfeit the sum of £200. A former act, passed in 1827, still in force, specially enacts in the case of the Excise, that persons in such service taking money or reward, or entering into any collusive agreement contrary to their duty, shall for every such offence forfeit the sum of £500, and be incapable of serving the crown in any office or employment; and any person giving or offering money or reward to Excise officers, in order to corrupt and prevail upon them, shall forfeit the like sum of £500, but simply and without any further penalty of disqualification.

BRIBERY OF JUDGES.—There is no statute in England against bribery of judges, but the punishment inflicted on Lord Bacon—viz. fine of £40,000, imprisonment during the king's pleasure, incapacity to be employed, and exclusion from parliament—shows how the offence is regarded. The same severity is traceable in the cases of Lord Middlesex, Lord Macclesfield, Lord Melville, and to some extent in that of Lord Westbury. This offence in the old Scots law was called *Barratry* (q.v.).

Brice, St., Bishop of Tours in the beginning of the 5th century, is commemorated as a confessor. *St Brice's Day*, in 1002 (in the reign of Ethelred II.), is notorious in old English history for a great massacre of the Danes. It was believed that it was a concerted attempt to exterminate all the Danes in England; but failing of its bloody purpose, it led to reprisals by the Danish king Sweyn.

Brick. The earliest examples of this branch of the ceramic art were doubtless the sun-dried bricks of Egypt, Assyria, and Babylonia. Remarkable to say, many of these, which, in a northern climate, the frosts of a single winter would destroy, have been preserved for some 4000 years by the dry, warm atmosphere of those countries. Sun-baked bricks of ancient date are also found in the mud walls of old towns in India. They are still much used for walls of houses in Persia, but are there faced either with burnt bricks or with plaster of Paris. Kiln-baked bricks must have been the products of a later time; but they are found in all the chief ruins of ancient Babylonia, where they were often used to face or bind together walls of sun-dried bricks, and occasionally they were even ornamented with enamelled colours. Burnt bricks were employed in the foundations of the Tower of Babel (q.v.). These ancient bricks, whether baked by the sun or by fire, were all made of clay mixed with grass or straw. Most of the great ruins in Rome are built of brick, and the Romans appear to have introduced the art into England. Interesting historical information has been obtained from the impressions on Roman, and especially on Babylonian bricks. Bricks of the modern or Flemish make were used in England in the 13th century. For the unburnt bricks of Texas, Mexico, and Central America, see **ADOBE**.

Manufacture of Bricks.—Clay suitable for the manufacture of common bricks is an abundant substance, but there is a great difference in the nature and quality of the clays found in various localities. The basis of clay consists of hydrated silicate of alumina, with a varying proportion of other mineral

matters, chiefly free silica (sand), iron, lime, magnesia, and potash. Great advantage is derived from digging clay in autumn, and exposing it all winter to the disintegrating action of frost. The next process is that of tempering or mixing the clay into a homogeneous paste, which is sometimes done by the spade, but more commonly in the pug-mill (see fig. 2). In making bricks by the old hand process, the shape is given by a mould either entirely of wood, or of wood faced with metal, and without top or bottom. A 'plane' is used to press in the clay, and to smooth the upper and lower surface of the brick.

Although hand-made bricks are still very common, yet machinery is now largely employed to

produce them. Brick-making machines are of two leading kinds: one class of them being constructed to work the clay in a wet plastic state, the other class requiring it to be in a dry or semi-dry condition. Of the two sorts, the wet-clay machines are the simpler, but the dry-clay machines, by forcing the clay into moulds by strong pressure, shorten the process, as no time is required for drying them. The bricks so made, too, are not only of a more perfect shape, but they can be moulded into any form, and may even be made ornamental at a very slight additional cost.

Fig. 1 will convey a good idea of the general plan on which most of the wet-clay machines work. The machine is driven by steam, and the clay is fed by a hopper into the pug-mill, A, on the central shaft of which strong pugging blades are placed in a spiral manner. These prepare and force the clay out at the bottom, whence it passes over the carrying rollers, C, to the pressing rollers, PP, which force it through a die at D, in a rect-

Fig. 1.—Brick-making Machine.

angular stream, S, so exactly shaped to the required size that nothing more is necessary than to cut it into single bricks by the wires, W. These are set in a rocking frame, which can be so adjusted as to cut the bricks on the square or at an angle; the one plan being adopted when the clay is at rest, the other while it is in motion. The figure shows what is called a single-ended machine. Some of these machines are provided with a pair of powerful crushing rollers, which reduce any hard lumps or stones before the clay enters the pug-mill. Hollow bricks and drain tiles are made by the same kind of machinery, with peculiarly constructed dies.

Fig. 2 shows a dry-clay machine by Messrs Bradley & Craven, Wakefield, which is considered an excellent one. The figure is a simplified diagram (vertical section) with only the principal parts shown. The machine comprises a mixer (not shown), a pug-mill, MM, a circular rotary moulding table, TT (more darkly shaded than the other parts), and a powerful press, P, worked by an eccentric, and moving in slides. The rotary table may have from twelve to twenty-four moulds round its periphery. In operation the clay is carried forward through the inclined mixer to the pug-mill, from which a pair of moulds (one only seen in figure at B) is directly under the operation of the pug-mill, the blades of which by their screwlike action com-

press the clay into the moulds. At each partial rotation of the table two pugged bricks are lifted out of the moulds (one seen at B'). These bricks are ejected by the lever, L, acting on the mould-pistons, X'. Self-acting gear (not shown) delivers the two bricks under the press, one of which is seen at B''. One of the dies of the press, which are kept hot by steam, is shown at D ready to

Fig. 2.

descend upon one of the bricks. After being pressed they are taken to the kiln. For brick-making machines in the United States, see Gillmore, in the Reports on the Philadelphia Exhibition of 1876.

The green bricks, after being carefully dried, either in the sun or by artificial heat, are usually

baked in a kiln with a suitable arrangement of fires and flues. Kilns are of different forms, but Hoffman's is considered a great improvement on the older kinds (see POTTERY). In it the waste gases from the main firing are utilised to partially burn newly-made bricks. The time required for firing in ordinary kilns varies from 40 to 60 hours for common red and white bricks, while for some fire-bricks 150 hours are necessary. Where kilns are not used, bricks are burned in clamps, the clay requiring to be mixed up, in the process of tempering, with a quantity of ground coal sufficient to burn them. A good test of the character of a clay is obtained by the result of firing. The average contraction in the kiln for prepared clays is 7½ per cent. If a brick contracts much more than this, the clay is too fusible.

All brick clays contain iron, and the colour of a burnt brick almost entirely depends on the amount of it which is present; thus clays containing less than 1 or 1½ per cent. of iron, change in the kiln to various shades of cream colour and buff, whilst those containing more than 2 per cent. range in colour from yellowish-fawn to dark red. Blue bricks are made from the same clay as the red by controlling in a peculiar way the supply of air in firing, and by carrying the heat slightly further. It is asserted by some that the red is changed to the black oxide of iron in the process.

London Stock Bricks.—This is the common kind of brick used in and about London. Fine-sifted ashes and coal are mixed with the clay in its manufacture. It is of a yellowish colour, and very serviceable; but it is only the best qualities of it that are fit for the fronts of buildings.

Rubbers.—Norfolk and Suffolk red and white bricks are largely used for facings in the metropolis and elsewhere. Some kinds of these, as well as some 'Malm stocks,' are soft enough to be rubbed true on the faces and beds for fine work, and they can even be carved.

Staffordshire Bricks.—For fineness of texture and uniformity of colour many bricks made in the pottery districts of this county are the best in England.

Glazed Bricks.—These are made of any desired colour on the face, which is imparted to the glaze. They are highly useful, not only for decorative purposes, but for passages, stables, and other places which require frequent cleaning.

Slate-bricks are made from the debris of slate-quarries. It has been ascertained that bricks composed of powdered slate are among the strongest kinds known.

Fire-clay Bricks.—Refractory clays are abundant in the coal-measures, some of fine quality being found about Newcastle and Glasgow, but the most celebrated is that of Stourbridge. The kinds containing least oxide of iron and alkaline substances make the best, because the most infusible fire-bricks. Gannister bricks are of the most refractory description. They are made of a highly siliceous fire-clay, and used for steel furnaces (see FIRE-CLAY).

Composition Bricks.—In districts where the carboniferous formation occurs, excellent building bricks are made of a mixture of fire-clay, shale, and common clay.

Dinas Fire-bricks.—These Welsh bricks are almost pure silica, and were long supposed to stand the high and long-continued heat of metallurgical and other furnaces better than any other known brick. They must not be placed near alkaline substances.

Bauxite Bricks, the most refractory of all fire-bricks, named from *Bauxite*, a clay from Baux, near Arles in France. They have been recently introduced, and are composed chiefly of alumina and oxide of iron, with a little silica. The iron

is reduced to the metallic state by the addition of a little plumbago.

Flouting Bricks.—A diatomaceous earth called fossil meal, and consisting largely of silica, is used to make these curious bricks which float in water. They are made in Tuscany, and are very refractory, but wanting in coherence. A similar earth has been found in the Isle of Skye, and one or two other places in Scotland.

American Bricks.—In the United States, bricks are as a rule of excellent quality. The face bricks of Philadelphia and Baltimore are equal to any made in other countries.

The duties formerly levied on bricks in Great Britain were wholly repealed in 1850.

Bricklaying. In some countries, and in large provinces or over extensive areas of others, brick is the only available material for house-building. Not unfrequently brick has to be resorted to even where stone abounds, if, owing to its hardness, the cost of working it is excessive, or if it be of a perishable nature, or has other faults which render it unfit for building purposes. Most of the towns of southern England, of Holland, and of North Germany, are largely or almost entirely built of brick.

The standard size of English bricks being 9 inches by 4½, the thickness of walls is regulated thereby. They are either half-brick, 1 brick, 1½, 2, 3, or 4 bricks in thickness. In moderate-sized modern English houses, the inside partition-walls are usually half-brick, the outer walls, 1 or 1½. Modern brick houses are, for the most part, far less substantial than those erected by our forefathers. Building leases being usually granted for ninety-nine years, at the expiration of which term the whole property reverts to the freeholder, the object of the builder is merely to make a house that shall stand for that period, and not to expend any money for the sake of further stability. In laying the foundations of walls, the first courses should be thicker than the intended superstructure, and the projections thus formed, usually of quarter brick on each side, are called 'set-offs' (see FOUNDATION).

Mortar composed of lime and sand is the common cement for brickwork. It should be equally and carefully applied; and the bricks wetted, in order that the mortar may adhere more firmly, by being absorbed into their pores (see CEMENTS).

The most important thing in bricklaying is to see that the wall is properly bonded. The bricks of every course should cover the joints of the course below it, or, to use the bricklayer's phrase, the work must 'break bond.' A layer or stratum of bricks is called a *course*. Bricks laid with their lengths in the direction of the course, and their sides to the wall face, are called *stretchers*; those laid transversely, with their ends forming the wall face, *headers*; a layer of headers, a *heading course*; of stretchers, a *stretching course*.

The two kinds of bond almost exclusively used in England are the English and Flemish bond. English bond consists of alternate stretching and heading courses; Flemish bond, of a stretcher and header laid alternately in each course (see figures); English bond is the strongest; Flemish bond, the more ornamental; and they are used accordingly. There are two other kinds of bond occasionally used for thick walls. In both, the centre of the wall is filled up with bricks laid diagonally, by what is called in the one case raking courses, and in the other herring-bone work. In order to strengthen the bond, bands of hoop-iron, tarred and sanded, are sometimes laid flatwise between the courses. This 'hoop-iron bond' has superseded the old practice of using bond-timbers. Walls of brick are frequently built hollow, and these dry quicker and perhaps more thoroughly than those

built solid. In such walls there is a thin outer and inner face of brick with hollow spaces between. Different ways are adopted for bonding or tying these walls. Hollow bricks are also used for walls, partitions, floor arches, and other work. Neat pointing of the joints often gives a very pretty appearance to brick-work.

Old English Bond.

Flemish Bond.

as arch stones are cut to the right shape. In all kinds of bricklaying the walls should be built up level throughout, in order that the *settlement* may be equal, and evidently they should be quite vertical.

Bricklaying is measured by the rod or by thousand. A rod contains 272 square feet of standard thickness—that is, $1\frac{1}{2}$ brick. This is equal to 306 cubic feet, and will, on an average, require 4500 bricks, allowing for waste. A cubic yard contains 384 bricks, and on an average 373 will weigh a ton.

Bricklaying in Frosty Weather.—The British Foreign Office issued in 1887 a very interesting report by Consul-general Michell on the building of brick walls in Norway in winter. For twelve years previous to 1887 building during frost has been practised at Christiania, and in that time a great many houses and some public buildings have been erected of brick either partly or entirely during weather which was frequently from 14° to 9° F. below freezing-point. It is still an open question to what limit of temperature such work can be carried on. The buildings hitherto erected have stood well. Building during frost is also executed to some extent in Berlin. Mr Paul Due, a leading architect in Christiania, says: 'In the use of unslaked lime lies the whole art of executing brickwork in frosty weather.'

Coloured bricks, as a means of external ornament, have been extensively and most effectively used in North Italy and Germany, and in England specially by Butterfield—e.g. in Keble College, Oxford. The works of Mr Ruskin, Mr Gally Knight, Webb's *Continental Ecclesiology*, Street's *Brick and Marble of the Middle Ages*, and Ferguson's *Handbook of Architecture*, and especially Gruner's *Terra-cotta Architecture of North Italy*, may be consulted for illustrated examples of these.

Chromatic brickwork is now becoming very extensively used in England, especially by architects who are endeavouring to revive the style of architecture called by themselves English Gothic, and by some others Venetian Gothic, in which the pointed arch, formed of coloured bricks, forms one of the prominent features (see TERRA-COTTA).

Bride (A.S. *brȳgd*) alone denotes the newly-married woman; with the addition of the word *groom* (a corruption of A.S. *guma*, 'a man,' allied to Lat. *homo*), the newly-married man (A.S. *brȳgd-guma*). The *r* in *-groom* is intrusive, as in *part-r-idge*, *vag-r-ant*, *co-r-poral* for Fr. *caporal*, *cart-r-idge* for Fr. *cartouche*, and *hou-r-se*. *Bride*

has cognate forms in the other Teutonic tongues; *bridegroom* has parallels in Dutch *bruidegom*, Danish *brud-gom*, Ger. *bräutigam*. *Bridal*, the marriage-feast, again, is for *bride-ale* (the latter being a common name for a feast, seen in *lect-ales*, *scot-ales*, *church-ales*, *clerk-ales*, *bid-ales*, and *bride-ales*). Originally it meant merely the carousal or drinking in honour of the bride, and indeed *bride-ale* is still in the Cleveland dialect of Yorkshire the name given to the draught presented to the wedding-party on its return from church. See WEDDING.

Bride, St. See BRIDGET.

Bridewell, a well between Fleet Street and the Thames, dedicated to St Bride, which has given its name to a palace, parish, and house of correction. Bridewell was a formidable castle in the days of William the Conqueror, and a residence of our early sovereigns. A palace described as 'a stately and beautiful house,' was rebuilt here in 1552 by Henry VIII. for the reception and accommodation of the Emperor Charles V. and his retinue; and King Henry himself also often lodged here, as, for instance, in 1525, when a parliament was held in Blackfriars. In 1553 Edward VI. gave it over to the city of London to be used as a workhouse for the poor, and a house of correction 'for the strumpet and idle person, for the rioter that consumeth all, and for the vagabond that will abide in no place.' Queen Mary having confirmed the gift, it was formally taken possession of in 1555 by the lord mayor and corporation. The chief portion of the palace was destroyed in the great fire of 1666. The bridewell was afterwards used for other persons than the class above named, and at last became a place of punishment till its removal in 1864. See PRISON, REFORMATORY.

Bridge (A.S. *brȳcg*; Dutch *brug*; Ger. *brücke*) is a structure raised over a river, lake, canal, road, valley, chasm, or other impediment, to connect the opposite sides, and form a passage across. To speculate on the absolute origin of bridges is unprofitable. The simplest, and no doubt the earliest, form of bridge is that by which a stream was crossed by laying a tree on two piles of stones, or on the banks, at opposite sides. The next step was probably a development of the simple log into a system of cantilever bridge, which afforded means of greatly increasing the span, as has for centuries been practised by Japanese bridge-builders. For spanning a stream of considerable width, they would lay two balks of timber, imbedding one in one bank, and the other in the other bank, with their ends projecting over the stream, so as to form two cantilevers, and would then add a centre balk reaching across from one to the other. A good bridge of this kind was one constructed across the mountain-stream flowing through Nikko, which, although it was built two hundred years ago, is known as the 'temporary bridge,' to distinguish it from the more elaborate structure crossing the stream near it, which has its approaches closed against all but imperial and aristocratic travellers. There is an ancient Indian cantilever bridge across the Sutlej, the side beams of which, 100 feet in length, are imbedded to the extent of 50 feet in the masonry of vertical abutments, leaving 50 feet projecting. On their ends rest a centre beam, with which the span is made up to about 200 feet.

But the skilful and intelligent construction of a permanent bridge, with a large number of blocks of stone, in combination, held together mainly by the force of gravitation, was a problem of another order: apparently outside the scope of the Greek forms of constructive design, when the people of Athens crossed the Cephissus by wading or ferrying. But it was thoroughly grasped

by the practical genius of the Romans, to whom, by general consent, the adoption of the arch as a constructive feature in works of architecture and of engineering is attributed. The Roman bridges generally consisted of a level road supported on one or more semicircular arches, exemplified in the Ponte de Rotto, or Senators' Bridge (fig. 1), erected

Fig. 1.—Ponte de Rotto.

by Caius Flavius, 127 B.C.—probably the first instance of the application of the arch in bridge design. The most remarkable bridge of antiquity was built by Trajan across the Danube, near Warkel, in Hungary, 4500 feet in length, 60 feet wide, consisting of twenty arches having a span of 170 feet, and 150 feet high from the foundations, constructed of squared stones. It was afterwards destroyed by Adrian, moved by jealousy probably, on the pretext that it would afford a passage for the barbarians into the empire. Some of the piers remain visible. The next considerable Roman work of this kind is the Pont du Gard, built in three stages, serving the double purpose of a bridge over the Gardon, and of an aqueduct for supplying the population of Nîmes with water. The bridge is 465 feet in length, and consists of six arches, which support a second series of arches, eleven in number, continued at each end to join the sloping sides of the mountains; and over these a third series, of thirty-five arches, much smaller than the lower arches, 850 feet in length, supporting a canal on a level with the mountains, 190 feet above the river. This unique structure was built with very large stones, worked with perfect accuracy to the required forms, and held together by iron cramps, without cement. It continues in a good state of preservation.

The semicircular arches of the ancients were succeeded by pointed arches, generally of small span; whilst in those of modern date the arches have generally been segmental—i.e. a segment of a circle less than a semicircle—or semi-elliptical. The segmental and elliptical forms are in general much the more suitable, as they combine wide spans and free waterway with moderate elevation. But they incur a much greater lateral thrust on the piers and abutments than the semicircular arch, which must of course be provided for in proportioning the form and mass of the supporting elements.

The Gothic 'triangular' bridge of Croyland, more

Fig. 2.—Croyland Bridge in 1790.

properly 'trefoil' or three-way bridge (fig. 2), now usually called 'Trinity Bridge,' was built appar-

ently about 1380 by the then abbot of Croyland in Lincolnshire (q.v.). It was erected at a point where a branch from the main stream of the Welland (1½ mile distant) divided into two smaller branches; and its three arches provided for three watercourses and three roadways. But it could never have been intended for heavy traffic, as it is too steep and too narrow for any vehicle. In 1854 the stream passing beneath, then become a common sewer, was arched over; and the bridge is now high and dry. On three piers or abutments arranged in a circle at the apices of an equilateral triangle, three semi-arches rise and meet in the middle—every two semi-arches balanced by the third. The longest bridge built in England in mediæval times, was that over the river Trent, at Burton in Staffordshire, erected in the 12th century, of freestone, consisting of thirty-six arches, and 1545 feet long. It was superseded by a new bridge in 1864.

One of the most interesting bridges in the world is the bridge over the Taff, on the road from Llantrissant to Cardiff and Merthyr, which crosses the Taff at the village of Newbridge. It is named the 'Pont-y-tu-Prydd,' or Pontypridd, which means literally 'bridge by the earthen house,' derived from a mud hut that stood near the site. It was first determined to erect a bridge at a spot lower down the river: and William Edwards, a country mason, undertook the work, which was commenced in 1746. The bridge consisted of three arches; but two years and a half after it was finished, it was swept away during one of the great floods to which the Taff, like other rivers in mountainous districts, is subject; the water rising to so great a height as to flow over the parapet. Edwards, to guard against the danger which led to the destruction of the first bridge—the obstruction of the channel by the piers—conceived the bold design of spanning the river with a single arch of 140 feet span. The second bridge had barely been completed, when by another, but very different accident, the bridge fell like its predecessor. The quantity of material in the centre of the arch was so limited in proportion to that laid over the spandrels or haunches, that the deadweight on the haunches forced up the crown of the arch; and, again, the whole was reduced to ruins. After this second failure, most men would have relinquished the attempt. Not so with Edwards, who, persevering and ardent, determined on a third effort to overcome the difficulty. He rebuilt the bridge in conformity with the second design of a single arch; and profiting by experience, he adopted the precaution of greatly reducing the deadweight on the haunches, by making in each spandril three through transverse cylindrical openings, from face to face of the bridge; and, in addition, he filled the internal spaces between the faces with charcoal, a material weighing not more than one-fourth of rubble stone, bulk for bulk. By this means, a permanent structure, finished in 1750, was reared, which has now lasted nearly 150 years. The arch is a segment of a circle; it measures 140 feet wide between the abutments, as already stated, and has a rise of 35 feet. The arch is not parallel faced, but is 14 feet 5 inches wide at the crown, widening to about 16 feet wide at the springing, or the abutments. This expanding form is an element of stability. The roadway is 11 feet wide at the crown. From the great rise of the arch, the roadway over it was uncommonly steep and even dangerous; and about 1830, the roadway was raised at each end, and the surface was paved. But even now it is so steep—the inclination being at the rate of 1 foot rise in 4 feet horizontally—that it is found necessary to use a chain and drag, so that when

a carriage reaches the centre of the bridge, one end of the chain is attached to the hinderpart of it, the other end being secured to the drag, upon which a boy generally places himself, so that as the carriage descends upon one side, the drag is pulled up on the other side, and thus relieves the horse in descending. Edwards erected several other bridges in South Wales. With the occupation of a mason he combined that of a Methodist minister, having preached for upwards of forty years at White Cross Chapel, in his native parish.

The nature of the arch, with definitions, has already been noticed in the article ARCH. Each stone of an arch is acted on by three forces, one of which, its proper weight plus the weight of the load above it, is vertical. The second and third, the pressure of the two contiguous stones upon it, are perpendicular to the surface of contact with these stones. The nature of the stress everywhere is essentially compressive—that is to say, every individual stone acts and reacts by simple pressure—the result of gravitation. When every portion of the arch is equally stressed, no part tending to yield before another, it is in a perfect state of equilibrium. But, as says the old proverb, 'an arch never sleeps'—always ready for a fall—and if too great a load be placed on the crown of the arch, it will open outwards at the haunches, and sink inwards at the crown. If, on the contrary, there be a deficiency of weight at the crown, the crown will open upwards, and fall in at the haunches, as happened in the case of the second Pontypridd.

It is readily conceived that the higher the rise of the arch in proportion to the span, the less intense proportionally is the stress in its component parts, the less injurious is any slight inaccuracy of workmanship or design likely to prove, and the easier is the work of construction. But the inconvenience of the steep slopes resulting from a great proportionate rise of the arch, in situations where the approaches are low, has enforced the adoption of the lowest practicable rise and a low elevation of the roadways of bridges—segmental or semi-elliptical in form, as before stated.

The celebrated Grosvenor Bridge over the river Dee at Chester (fig. 3), supplies a fine example of a segmental arch of large span, the second largest span of a stone bridge in the world, the arch over Cabin

Fig. 3.—Grosvenor Bridge.

John Creek, in the Washington Aqueduct, being the largest, 220 feet. The old bridge connecting Chester with a suburb, Handbridge, first noticed in the 13th century, is recorded to have fallen down or been carried away twice. The third erection was of stone, in 1280, consisting of seven arches, pointed Gothic, supported on huge piers or buttresses. The old bridge has been aptly described by Ormerod, as 'a long fabric of red stone, extremely dangerous and unsightly, and approached by avenues to which the same epithet may be safely applied.' The new bridge was designed by Mr Harrison, a local architect. It consists of one arch of 200 feet span, and 42 feet of rise—a segment of a circle of 140 feet radius. The total length is about 345 feet, and the clear width of roadway is 33 feet. It is below the old bridge, and stretches from the rock below Chester Castle towards the village of Overleigh. The abutments are founded on the

solid rock, except where a fault occurs from the rock dipping almost vertically, at the back part of the north end, and where filling was necessary. So soft was the material with which the fissure was filled, a kind of quicksand, that the piles went down 5 or 6 feet at a blow for a considerable depth. A floor of stone was laid on the head of the filling, and the abutment was built upon it. The arch stones are 4 feet deep at the crown, and gradually increase to 6 feet at the springing. The radiating courses of stones on the principle of the arch is carried through the abutments, even down to the foundations; and the rock itself becomes the actual abutment as shown in fig. 4. The bridge was constructed of native sandstone, excepting the faces of the abutment and the first two courses of the arch, which are of granite.

The centering (fig. 4) on which the stupendous arch was raised consisted of six ribs in width of fir timber. The span of the arch was divided into four spaces by means of three nearly equidistant piers

Fig. 4.—Centering of Grosvenor Bridge—Half Length.

of stone built in the river, from which the timber spread fan-like towards the soffit or under face of the arch, where they were bound together with thick planking bent round to the curve of the arch. On the rim thus formed, the lagging or covering to form the bed on which the stones were laid was supported over each rib by wedges, by means of which the bed could be adjusted to the true curve, and which were driven out when the bridge was completed in order to remove the centering. The framing of the centering was composed entirely of whole and half timbers, from 22 to 36 feet in length; and, in all, the centre used up 10,000 cubic feet of timber. The effectiveness of the system adopted was proved by the circumstance that half of the arch was turned before the centre was finished; and that on its removal, the crown of the arch sank only from 2½ inches to 2⅝ inches, the joints remaining perfectly close, and no derangement of form, or of 'spanching' or cracking being perceptible. The cost of the centering did not exceed £500.

The Grosvenor Bridge was constructed in the course of five years, and was opened in 1832. The total cost of the work was £49,900, which included a sum of £7500 for the embankment forming the approaches, or £145 per lineal foot.

John Rennie led the way to the adoption of semi-elliptical bridges. His first important bridge—across the Tweed, at Kelso—opened in 1803, consists of five semi-elliptical arches of 72 feet span, with a rise of 28 feet, and four piers 12 feet thick, with a level roadway 23½ feet wide between the parapets, and 29 feet above the ordinary surface of the river. The foundations were laid on solid rock. The piers and abutments are ornamented with three-quarter columnar pilasters of the Roman-Doric order, surmounted by a plain block-cornice and balustrade of the same character. Kelso Bridge, as Dr Smiles observes in his *Lives of the Engineers*, may be regarded as the model of the greater work by the same engineer—Waterloo

Bridge. It was, he adds, one of the first bridges in this country constructed with a level roadway, contrasting vividly with the old-fashioned bridges, sloped like the roof of a house, as, for instance, the Pontypridd already noticed.

Waterloo Bridge, across the Thames, designed by John Rennie, has a level roadway, carried on nine equal semi-elliptical arches, of 120 feet span each, and 32 feet rise, leaving a clear height of 30 feet above high-water spring-tides. It was built of granite, in a style of solidity and magnificence previously unknown. Inverted arches were built between the elliptical arches in order to counteract the lateral pressure. The elliptical arch was carried to a greater extent of flatness than in bridges previously built. Isolated cofferdams upon a great scale, in a tidal river, with steam-engines for pumping out the water, were employed in the building of this bridge, for the first time, it is believed, in Britain. The length of the bridge between the abutments is 1380 feet, and the width between the parapets is 42 feet 4 inches. The long inclined approach on the Surrey side is formed by a series of thirty-nine semicircular arches of 16 feet span, besides an elliptical arch, of 26 feet span, over the Narrowwall Road, and an embankment 165 yards long, on an inclination of 1 foot rise in 34 feet of length. The total length of the bridge, with approaches, is 2456 feet, or nearly half a mile.

Fig. 5.—Centering of Waterloo Bridge.

The bridge was finished in 1817. The centering employed in the erection of the arches is illustrated by fig. 5, and is an excellent example of centering supported at the piers. It may be observed that the loads on the upper face of the centering are resisted by oblique struts passing to the right and to the left, finally taking their bearing on the base of the piers. At each of the points *c, e, g, &c.* a pair of oblique struts is placed to take the thrust, one of them resting on a pier, the other lodged in the central shoe, *k*, and opposed by the corresponding strut from the other half of the arch. When the centres were struck, the sinking of the arches did not exceed from $2\frac{1}{2}$ to $3\frac{1}{4}$ inches at the crown.

New London Bridge (fig. 6), across the Thames, was built 180 feet higher up the river than the old bridge. It consists of five semi-elliptical arches, the least of which is wider than any other elliptical arch ever before erected. The centre arch has $152\frac{1}{2}$ feet span, with $37\frac{1}{4}$ feet rise; the next two arches are of 140 feet, and the two abutment arches

are of 130 feet span. The roadway is 52 feet wide. The clear waterway at all times of the tide is 692 feet, or 60 feet more than the old bridge afforded at high-water. The whole length of the bridge is 1005 feet. At the City side the bridge is carried

Fig. 6.—London Bridge—Half Length.

over Thames Street on a dry arch. At the Borough or south side the approach is formed on an inclined plane, supported on a series of brick arches, with a large dry arch facing Tooley Street. This bridge deserves further remark for the difficulty of the situation in which it was built, above the old bridge, in a depth of from 25 feet to 30 feet at low-water, on a soft alluvial bottom, covered with large, loose stones, scoured away by the force of the current from the foundations of the old bridge. The whole of these stones had to be removed by dredging before the cofferdams for the piers and abutments could be commenced; otherwise it would have been extremely difficult, if not impracticable, to have made them watertight. The difficulty was further increased by the old bridge being left standing, to accommodate the traffic whilst the new bridge was building, and the restricted waterway of the old bridge occasioned such an increased velocity of the current as materially to retard the operations of the new bridge. At times the tide threatened to carry away all before it; and it was found expedient that two of the small arches of the old bridge on each side should be thrown into one, to compensate for the additional obstruction which the water occasioned to the navigation. The piers and abutments stand upon platforms of timber, the floors of the cofferdams resting upon piles about 20 feet long. The masonry is from 8 feet to 10 feet below the bed of the river. The great magnitude and extreme flatness of the arches, of which the keystones are 4 feet 9 inches long, demanded unusual care in the selection of the materials, which were of the finest blue and white granite from Scotland and Devonshire, as well as great accuracy of workmanship. The new bridge was opened for traffic in August 1831, the period occupied in its erection, from the time of driving the first pile for the dam of the south pier, being seven years, five months, and thirteen days.

The centering employed for the new London Bridge is worthy of notice. It consisted of trussed timber girders, supported at the piers. The striking plates and wedges, by which the centre was lowered after the completion of the arch, were strong beams suitably notched, one of which, the wedge, was kept in its place by cross wedges. When the centre was to be lowered, the cross wedges were knocked out, and the main wedge driven back.

In the following table are given the leading dimensions of the largest stone arches that have been built for common roads, from 150 feet of span upwards:

Name.	River.	Form.	Span.	Rise.	Keystone.	Date.	Engineer.
			feet.	feet.	ft. in.		
Claix (Grenoble).....	Drac	Circular	150	54	3 1	1611
Gloucester.....	Severn	Elliptical	150	35	4 6	1827	Telford.
London	Thames.....	Elliptical	152	$37\frac{1}{4}$	4 9	1831	Rennie.

Washington Aqueduct	Cabin John Creek.	220	Meigs.

The development of the railway system, with command of plenty of capital, has afforded opportunities for the construction of bridges on a grander scale than for common roads. The largest railway bridges usually cross rivers or canals, the smaller single-arch bridges over or under local roads, and for field communication. The number of these is surprising. There are no fewer than 63 such bridges under or over the railway on the 30 miles between Liverpool and Manchester. There are 160 bridges over and 110 under the London and Birmingham line; on the South-Eastern line there are 141; and between London and Gosport, on the South-Western line, there are 188; making a total of nearly 600 bridges on 287 miles of railway, or over two bridges per mile.

The brick bridge over the Thames at Maidenhead, on the Great Western Railway, designed by Mr I. K. Brunel, supplies a remarkably daring instance of wide spans, combined with a low rise of arch. It consists of a central pier and two main arches, flanked at each end by four openings for the passage of flood-water. The main arches are elliptical, 128 feet span, with a rise of 24½ feet only. The land arches are semicircles, 28 feet in diameter. The central pier stands in the middle of the river upon a shoal which provided a good foundation, whilst the deep waterway was left free for the navigation. The low rise of the arches was imposed by the condition of the gradients.

With the railway system, nevertheless, the semicircular stone arch has been revived in bridges as well as in viaducts. One of the most imposing structures of this class, forming part of the Glasgow and South-Western Railway, is the Ballochmyle stone viaduct (fig. 7), over the river Ayr, which

Fig. 7.—Ballochmyle Bridge.

spans the river by a semicircular arch of 180 feet span, founded on rock—the largest span of railway masonry in Britain or elsewhere—with six auxiliary arches of 50 feet span. The arch stones of the central arch are 4½ feet broad. The centering of timber erected for the construction of this arch was a masterpiece of carpentry, well worthy of careful study. Its principal members were composed of 14-inch square barks, carried up from the bed of the river, well braced by diagonals, especially transversely, as the height was very great in proportion to the width. Rails were laid at the upper part of the framing to carry the traversing cranes employed in the construction of the arch. The highest point of the centering stood 157 feet 4 inches above the bed of the river. The level of the rails on the viaduct is 167 feet high.

The Congleton Viaduct, on the Manchester and Birmingham Railway, is amongst the longest in Britain. It is of stone, 1026 yards, or more than half a mile in length, and 106 feet high. It cost £113,000, or £113 per lineal yard. The Dane Viaduct, on the same line, is of brick, 572 yards long, 88 feet high; and it cost £54,000, or £95 per lineal yard, having 23 arches of 63 feet span. On the railway lines entering London and other large cities and towns, there are miles of brick viaducts, extending often as far as the eye can reach. On the Vincenza and Venice Railway there is a viaduct (1845) of stone and brick, by which the

Laguna Veneta is crossed, consisting of 222 arches, and 12,000 feet, or more than two miles long. Thus is Venice, the ocean city, chained to the mainland.

Timber bridges, or frame bridges, as they are occasionally called, are now almost unheard of in Britain—particularly on railways, by reason of their want of durability; and such railway bridges as have in earlier times been built of timber in Britain, have for the most part been reconstructed of stone, brick, iron, or steel. Nevertheless, timber bridges are in some situations, in new and poor countries, practically the only works available where timber is abundant and cheap. It may be proper to place on record the frame bridge constructed at East Linton, on the North British Railway (fig. 8), as a masterpiece of construction, having stone abutments and timber arching, the timber being so disposed as to combine a perfectly stiff, unyielding platform with free circulation for air and economy of material.

Fig. 8.—Frame Bridge at East Linton.

The main timbers are all in compression; there is nothing in tension, and struts are inserted by which the inclined timbers are firmly combined and stiffened to resist the compressive stress. It may be explained that this bridge, which is over the Haddingtonshire Tyne, was built originally with a stone arch, which fell and was replaced by the timber structure. A viaduct, having timber arches of long span, was erected on the line of the Manchester and Sheffield Railway over Dinting Vale, and opened in 1844. This viaduct consists of 16 arches, 5 of which are of Memel timber, each of 125 feet span, with 25 feet rise. There are four laminated main ribs in each arch, each 4½ feet deep, 18 inches wide, consisting of 3-inch planks laid longitudinally, firmly stayed together. The remaining 11 arches are of brick, of 50 feet span.

It is to the United States of America that we must look for examples of high-class timber bridges and viaducts on a large scale. The 'inflexible arched truss,' introduced by Mr D. C. McCallum, has probably been in more general use in the States than any other system of timber bridge. It is illustrated in fig. 9, showing one-half of a railway

Fig. 9.—Inflexible Truss Bridge—Half Length.

bridge of 200 feet span, 15 feet wide in the clear for a single line. The depth of the truss is 26 feet at the centre, 21 feet at the ends. Its cost is said to be from £6 to £8 per lineal foot.

Cast-iron Bridges.—Towards the close of the 18th century, some bridges were erected, the arches of which were constructed mainly of cast-iron. The first of these structures was the bridge over the Severn, near the town of Ironbridge, erected by Mr Darby, of Coalbrookdale Ironworks, in 1779.

The bridge consisted of a single arch, nearly semi-circular, of 100 feet span. The most celebrated bridge of cast-iron is Southwark Bridge, across the Thames, designed and erected by Mr Rennie, opened in 1824. It consists of 3 cast-iron arches, with stone piers and abutments. The arches are flat circular segments, the central arch having 240 feet span, with a rise of 24 feet, and springing at a level of 6 feet above high-water of spring-tides. The two side arches are of 210 feet span, with a rise of 18 feet 10 inches. The piers are 24 feet wide at the springings. There are 8 arched ribs in the width of the bridge. The arches are $2\frac{1}{2}$ inches thick, and from 8 feet deep to 6 feet deep at the crown; they are in 13-foot lengths, bolted together and joined by transverse plates of the same depth. The roadway is 42 feet wide. The weight of the central arch is 1605 tons, and that of each side arch 1460 tons, making a total of 4585 tons of metal. The rise of the arch due to expansion by heat was observed to amount to $1\frac{1}{4}$ inches for 50° rise of temperature. The bridge is 718 feet long between the abutments.

Two railway bridges of a composite character, combining a cast-iron arch with plate-iron horizontal members, were designed by Sir John Fowler for the Coalbrookdale Railway, and the Severn Valley Railway, crossing the river Severn. Each bridge has a span of 200 feet, with a rise of 20 feet, consisting of 4 ribs for supporting a double line of way.

The high-level bridge over the deep ravine through which the Tyne flows between Newcastle

most striking features of the bridge. It is suspended from the upper or railway roadway. There are 4728 tons of cast-iron in the bridge, and 321 tons of wrought-iron. The bridge cost £243,000, or, say, £176 per lineal foot. It was opened by the Queen in 1849. The first difficulty in building the bridge was to secure a good foundation for the piers. The first pile was driven to a depth of 32 feet in four minutes; and as soon as one was placed, the traveller hovering overhead presented another, and down it went, like a pin into a pin-cushion. When the piles had been driven and the cofferdams completed, the water was pumped out. But though powerful engines were employed, it forced itself through the bed of quicksand as fast as it was removed. Every effort was made for months to overcome it, but without success, until at last a bed of cement-concrete was laid in, a foundation was made, and the piers were built.

This bridge is historically interesting, as it shows a transitional form intermediate between the arch and the girder—between cast-iron structures and wrought-iron structures (see also the article NEWCASTLE).

Wrought-iron Bridges.—The unsuitability of cast-iron as a material for bridges of very large span—long-span bridges as they are called—raised the question of the sole employment of wrought-iron as the material for the crossing of the Conway and the Menai Strait, on the line of the Chester and Holyhead Railway, involving spans of 400 feet and upwards. The maximum existing

span in cast-iron—that of Southwark Bridge—did not exceed 240 feet; and for the greater spans Mr Robert Stephenson conceived the idea of wrought-iron tubes for crossing the Conway River and the Menai Strait in large spans, through which railway trains were to be conducted. Sir William Fairbairn devised and conducted the preliminary course of experiments required for the purpose of testing by models the strength of such a structure, with others of elliptical and rectangular section for comparison. Rectangular tubes had the advantage in point of strength, and a model beam accordingly was constructed, to a scale of one-sixth of the proposed bridge. It bore the test most satisfactorily, and showed that the proposed tube could be made self-supporting over the desired span of 460 feet. Arrangements were accordingly made for the erection of the colossal structure

Fig. 10.—Britannia Bridge.

and Gateshead is a unique structure in cast-iron, a fine example of the bow-string arch. It formed the junction between railways from York and from Berwick, then separate (now the North-Eastern main line). It was proposed by Mr Hudson, the railway king, and designed by Mr Robert Stephenson and Mr T. E. Harrison. There are two roadways—one for carriages and foot-passengers, level with the Castlegarth, and the other, 22 feet above it, for railway traffic. The bridge consists of six spans of 125 feet each; the piers, 16 feet thick, being of masonry, the arched ribs of cast-iron, and the ties of wrought-iron. The soffit or under side of the roadway is 83 feet above high-water. The total height of the piers is 131 feet from the foundation. The carriage-road is 1380 feet in length—about a quarter of a mile. It forms one of the

itself. The Britannia Bridge (fig. 10), so called after the Britannia Rock on which the central pier rests, was built across the Menai Strait. It consists of two independent continuous wrought-iron tubular beams, 1510 feet in length, weighing 4680 tons each, independent of the cast-iron frames inserted at their bearings in the towers. They rest on two abutments and three towers of masonry at a height of 100 feet above high-water. The middle, or Britannia tower, 230 feet high, is built on a rock in the middle of the strait. The bridge is thus in four spans, of which there are two spans of 460 feet over the water, and two spans of 230 feet over the land. The weight of one of the longer spans, single tube, is 1587 tons, and that of one of the shorter spans 630 tons. The average weight of a single tube is over three tons per lineal

foot of advance. A transverse section of each tube is shown by fig. 11. The chief mass of the material is placed at the top and the bottom, represented by the upper and lower flanges or tables of an ordinary beam, the two sides serving to connect the top and the bottom. Constructed of plate-iron, the top requires more metal than the

Fig. 11.

bottom, in order to resist the buckling stress to which it is subject. But, instead of putting the metal into one thick plate, or into several plates laid one on another, it is constructed to form a set of small tubes or cells, which give additional stiffness and strength to the whole tube. The floor, in like manner, contains cells. Each tube is straight on the lower face, and slightly curved on the upper face, inasmuch that the height of the tube externally is 30 feet at the middle in the Britannia Tower, and 26 feet internally, and 22 feet 9 inches and 18 feet 9 inches at the extremities in the abutments. The width of each tube externally is 14 feet 8 inches, and 13 feet 5 inches clear inside. The side plates are from $\frac{1}{2}$ inch to $\frac{3}{4}$ inch in thickness; the top plates are from $\frac{3}{8}$ inch to $\frac{1}{2}$ inch, for resisting compression; and the bottom plates are from $\frac{1}{8}$ inch to $\frac{1}{4}$ inch thick, for resisting extension. The tubes repose solidly on the centre tower, but on the land towers and abutments they repose on roller beds, thus permitting free expansion and contraction according to the temperature. The daily variation of length is from $\frac{1}{2}$ inch to 3 inches for the whole length of the tube, the extremes of the movement being attained at about 3 P.M. and 3 A.M. The effect of sunshine in deflecting the Britannia Bridge, as observed by Mr Edwin Clark, is very curious. A short spell of sunshine on the top of the tube raised it on one occasion nearly an inch in half an hour, with a load of 200 tons at the centre, the top plates of the bridge being expanded by increase of temperature, while the lower plates remained at constant temperature by radiation to the water beneath them. In like manner, the tube was drawn sideways to the extent of an inch by the sun shining on one side, and it returned immediately to its normal position as clouds passed over the sun. The tubes sometimes move as much as 2½ inches vertically or horizontally when the sun shines on them. The tube is in fact a most delicate thermometer, in constant motion, both vertically and laterally. The Britannia Bridge was opened in March 1850 by the passage through it of three powerful locomotives with tenders. The second experimental train that went through consisted of twenty-four heavily laden coal-wagons, aggregating 300 tons weight. The train was drawn through the tubes at leisurely speed. During the passage a breathless silence prevailed, and when the train emerged at the other end the event was announced by great cheering, mingled with the reports of pieces of ordnance. One can imagine the relief from intense anxiety to the engineer. 'Often at night,' said Mr Stephenson, 'I would lie tossing about, seeking sleep in vain. The tubes filled my head. I went to bed with them, and got up with them. In the gray of the morning, when I looked across Gloucester Square, it seemed an immense distance across to the houses on the opposite side. It was nearly the same length as the span of my tubular bridge.'

A similar tubular bridge across the Conway, on

the line of the Chester and Holyhead Railway, was designed and erected by Mr Stephenson. It consists of two tubes, each of one span of 400 feet, and was opened for traffic in May 1848.

The Victoria Railway Bridge (1854-59) over the St Lawrence River, at Montreal, Canada, is tubular in design, like the Britannia Bridge. It is 9144 feet, or nearly $1\frac{3}{4}$ miles in length, in twenty-four spans of 242 feet, and a central span of 330 feet. The total length of each of the tubes is 6592 feet; and there are 9044 tons of iron in the tubes, or about 1 ton per lineal foot. There is a total painted superficies equal to 32 acres. The river is 8660 feet, or about $1\frac{1}{2}$ miles wide at the crossing, where it descends at the rate of 7 miles per hour. The bridge is remarkable chiefly for its ice-breaking piers, which are constructed with large bows at the up-river ends to resist the enormous pressure of the ice in spring. The rails are 60 feet above the level of the river.

Although tubular bridges are not likely to be constructed in the future, it should be remembered that it was in tubular bridges that the first attempt was made to introduce wrought-iron in long spans upon railways. This was done by Mr Stephenson at a time when perhaps it would not have been in the power of any other man to influence the introduction of wrought-iron in such structures. The experience of the tubular bridge, nevertheless, has led to a development of plate-iron girder bridges, in which the cellular principle of the tubular bridge has been applied in the designing of the longitudinal girders or beams between which the roadway is carried. The early forms for such girders are typified in the wrought-iron girders of the Torksey Bridge, Lincolnshire, erected in 1850. The bridge is constructed of two spans of 130 feet each. The girders are of uniform depth—10 feet. The upper boom or member of each girder is cellular, being the form best adapted to resist compression, and is constructed of plates $\frac{3}{8}$ inch and $\frac{1}{2}$ inch in thickness. The lower boom is not cellular like the top, as it is exposed only to tensile stress, and is constructed of plates $\frac{3}{8}$ inch and $\frac{1}{2}$ inch thick, riveted together. The two side plates, inclosing a hollow space, are made of $\frac{1}{2}$ -inch plates.

Lattice-girder Bridges.—The iron lattice bridge—so called from having sides constructed with cross-bars, like lattice-work—is the natural outcome of the tubular bridge for long spans, developing equal strength with considerable economy of material and labour.

Lattice bridges of timber were first used in America, where timber is cheap. The first lattice-girder in iron was designed by Sir John MacNeill, and erected in 1843 on the line of the Dublin and Drogheda Railway, near Dublin, of 84 feet span.

Fig. 12.

Lattice-girders are now almost universally adopted for iron bridges for long spans. Amongst the earliest of them is the lattice bridge forming a

portion of the Boyne Viaduct on the line of the Dublin and Belfast Junction Railway, near Drogheda, completed in 1855. It has three large openings, of which the middle span is 264 feet long, and the side spans 138 feet. There are two side girders 26½ feet deep, 24½ feet apart, connected by cross girders of lattice-work above and

below—forming a rectangular inclosure, within which, on a platform, two lines of rails are laid on which the trains run. Each of the lattice-bars is crossed by six others at the angle 45 degrees, forming squares (fig. 12).

The Charing Cross Bridge across the Thames, on the line of the South-Eastern Railway (fig. 13), is

Fig. 13.—Charing Cross Bridge—Half Length.

a lattice bridge of a different order, having a total length of 1365 feet, over a quarter of a mile. It consists of nine spans, six of which are 154 feet clear, and three are 100 feet clear. In the superstructure of each opening of 154 feet there are two main girders, 49 feet 4 inches apart transversely between their central lines, connected beneath by transverse girders, carrying four lines of rails, and projecting at each side to carry a footpath. The main girders are 14 feet deep. The sides are constructed of top and bottom booms of plate-iron, and are in panels divided by vertical bars, each panel containing two diagonal bars, crossed at the angle 45 degrees, and fastened to the booms by means of large round pins or bolts from 5 inches to 7 inches in diameter. The weight of one main girder is 190 tons. The bridge was built on the site of Brunel's old Hungerford Suspension Bridge, the two brickwork piers of which were utilised for the present bridge. The piers

for the spans of 154 feet, other than the brick piers, are cast-iron cylinders, 10 feet in diameter above ground, and expanded to a diameter of 14 feet in the ground, thus supplying a very wide base for each cylinder. Each pier consists of two such cylinders (fig. 14), one for supporting each main girder. The piers are formed of segmental cast-iron plates bolted together, and they were sunk

Fig. 14.

Charing Cross Bridge: one of the Piers.

to a depth of 62 feet below high-water mark, by excavating the material from the inside by divers armed with helmets, until they became bedded on the London clay. They were weighted with 150 tons of load, to overcome the friction of the soil on their sides, and to sink them to their destined depth. They were filled with concrete and brickwork, capped with granite bearing-blocks. Under a load of 700 tons, the cylinders thus filled sunk a

further depth of 4 inches into the clay. Altogether there are nearly 7000 tons of metal in the bridge. The total cost of the bridge, including the abutments, was £180,000, or £131 per lineal foot. The bridge thus at first constructed has recently been doubled in width to meet the development of traffic. For the Tay Bridge, see DUNDEE.

American Quadrangular Girder Bridges.—One of the best examples of American long-span iron-bridge construction (fig. 15) is the bridge across the Kentucky River on the Cincinnati Southern Railway, designed by Mr C. Shaler Smith—noteworthy for the economical design and comparatively light weight. The ironwork of the bridge is 1138 feet in length, and it consists of three spans of 375 feet each. It crosses a limestone

Fig. 15.

Bridge across the Kentucky River—Half Length.

cañon at a height of 280 feet above the bed of the stream. The piers are of stone to a height of 60 feet, to clear the highest recorded floods; and they are about 34 feet thick at the flood-level. Above the stonework the piers are of iron. The truss or girder is rectangular in section, 37½ feet high, 18 feet wide, consisting of top and bottom pairs of booms, forming the corners, united by panels or frames at intervals of 18½ feet longitudinally, stiffened and bound with diagonal tie-rods. The booms each consist of flat plates placed vertically, riveted together. The piers consist of hollow pillars of plate-iron riveted together in box form. The diagonal rods are 'pin-connected'—that is to say, they are connected to the framework with cylindrical pins, a form of connection much practised in the States. The bridge was completed in February 1877. The expansion and contraction of the bridge operate each way from the centre, bending the tops of the piers correspondingly towards or from the shores; the greatest observed movement being half an inch either way. The ends of the girder rest by means of rollers on the abutments, and

they have a maximum of 3 inches of travel resulting from variation of temperature. The ironwork of the bridge weighs 1631 tons, or 1.43 tons per lineal foot—less than half the weight per lineal foot of the tubes of the Britannia Bridge.

Cantilever Bridges—The Forth Bridge.—The principle of the cantilever bridge has already been noticed as applied primitively in Japan and India, and in China also. A cantilever is, as Baker has said, a bracket: a structure overhanging from a fixed base. The bridge across the river Forth (fig. 16), on the North British Railway system, opened by the Prince of Wales, 4th March 1890, is the largest and most magnificent bridge in the world. The engineers were Sir John Fowler, K.C.M.G., and Sir Benjamin Baker. The site of the bridge is at Queensferry. At this place, the estuary of the Forth is divided by the island of Inchgarvie into two channels, whose depth, as much as 200 feet, precluded the construction of intermediate piers. Hence, two large spans of 1700 feet each were adopted. Between these, the central pier is founded on the island midway across, and is known as Inchgarvie pier. There are two other main piers—shore-piers—known respectively as the Pife pier and the Queensferry pier. On these three piers respectively three double lattice-work cantilevers (fig. 17), like scalebeams,

cylindrical columns of masonry 36 feet high, each 49 feet in diameter at the top, and 55 feet at the bottom, founded on rock or on boulder-clay. To make assurance doubly sure, the superstructure is bolted down to each column with forty-eight steel bolts $2\frac{1}{2}$ inches in diameter and 24 feet long.

The piers were founded by means of Cofferdams

Fig. 16.—General View of the Forth Bridge (looking up the river).

Fig. 17.—One of the Cantilevers of the Forth Bridge.

1360 feet, or a quarter of a mile in length, are poised in line, reaching towards each other, and connected at their extremities by ordinary girders 350 feet long, by which the two main spans are completed. The bridge consists of two main spans of 1700 feet, or nearly one-third of a mile each; two of 675 feet each, being the shore-ends of the outer cantilevers; and 15 spans of 168 feet each. The total length of the viaduct, including piers, is 8296 feet, or a little over $\frac{1}{2}$ miles, of which almost exactly 1 mile is covered by the great cantilevers. The clear headway under the centre of the bridge is 152 feet at high-water, and the highest part of the bridge is 361 feet above the same level. Each of the three main piers consists of a group of four

(q.v.) for shallow depths under water, and Caissons (q.v.) worked with compressed air for the deep water at Inchgarvie and at Queensferry. At Inchgarvie, two caissons constructed of wrought-iron plates, 70 feet in diameter, were sunk, the rock being excavated from below the lower edge of the cylinder, to a depth of 72 feet below the waves of the Forth. The operations were conducted under the pressure of compressed air in a mining-chamber 7 feet high, lighted by electricity, at the lower end of the caisson. A striking incident served to impress the reality of the high pressure of the air in this chamber. A flat-sided spirit-flask was taken down and emptied. The bottle of course was filled with compressed air, of a pressure of 33 lb. per square inch, and was corked. Under this pressure it exploded when passing through the Air-lock (q.v.) into the open air. At Queensferry, four caissons like those employed at Inchgarvie were sunk to depths of from 71 to 89 feet below high-water. The bed of the river was of soft mud, through which the caissons were sunk into hard boulder-clay. The mud, after having been diluted with water, was blown out by the compressed air supplied to the mining-chamber. The caissons were gradually filled with concrete as it was required, to steady them, and at the same time to drive them down by deadweight through the clay. When they were sunk to the required depth, the bottom or mining-chamber was cleared out and rammed with concrete, grouted up under pressure. No subsidence took place after this final operation, the boulder-clay being very hard. But independently of this consideration, it is readily seen that by in this way substituting the whole area of the immense circular caisson for the mere circular cutting-edge at the bottom to take a bearing on the clay, the bearing surface, and with that the resistance to a vertical load, was almost indefinitely increased. When the concrete was filled to the water-level, the piers were carried up with massive stones laid in cement, the whole pier becoming one solid mass.

The bridge is taper in plan, each span narrowing from a width of 120 feet—the distance apart of the lower members of each cantilever—at the pier, to a minimum of 31½ feet at the extremities of the cantilever, giving an outline, in a vertical view of it, like a truncated triangle, in order to confer a degree of stiffness laterally, for resisting irregular stresses, wind-pressure in particular. The metal columns above each pier, forming the basis of the cantilever, are 12 feet in diameter. The members under compression are tubular, those in tension are of open braced forms. The wind-pressure is assumed from calculation at a maximum of 56 lb. per square foot. The maximum possible stress on any member of the bridge is calculated to be at the rate of 7½ tons per square inch of sectional area, leaving a plentiful margin of strength, since the steel of which the bridge is constructed is capable of resisting a tensile stress of from 30 to 33 tons per square inch, and compression to the extent of from 34 to 37 tons per square inch. Between the two main girders a double line of railway is carried on an internal viaduct supported by trestles and cross girders. The whole of the metal-work of the superstructure is of Siemens steel. The way will consist of heavy bridge-rails laid on longitudinal sleepers bedded in four steel troughs, into which the wheels will drop in case of derailment, when they will run on the sleepers.

In the piers there are about 120,000 cubic yards of masonry, and in the superstructure 44,500 tons of steel. The bent steel plates which go to make the tubes and struts would, if placed in a line, end to end, stretch a distance of 42 miles. There are 20 acres of surface to be painted. The contract was let for the sum of £1,600,000, or £215 per lineal foot. An impression of the great magnitude of the bridge is derived from a comparison with the largest completed railway bridge in England—the Britannia Bridge, which has spans of 460 feet—little more than one-fourth of the spans of the Forth Bridge. The best proof of approval is imitation. In this connection mention should be made of the fine organisation of labour secured by Sir Wm. Arrol, of Tancred, Arrol, & Co., the contractors, and of the ingenious special tools designed by him for carrying out the work of construction. Since the first publication of the design for the Forth Bridge, nearly every new long-span bridge throughout the world has been built on the principle of that design.

For comparison with the largest bridge in the world, the following particulars of a few mammoth railway bridges are given :

	Length. Feet.	Greatest Span. Feet.
Forth Bridge	8236	1700
Brooklyn Bridge.....	5989	1395
Niagara Bridge	821
Britannia Bridge.....	1510	460
Victoria, Montreal.....	9144	330
Boyne Viaduct.....	1760	264
Tay Bridge	10,750	245
Charing Cross Bridge	1365	154
Crumlin Viaduct, Monmouthshire	1800	153
High-level Bridge, Newcastle-on-Tyne.....	1380	125
Ann-Daria Bridge	6320	793
Memphis Bridge (over Mississippi).....	1886	600
Cernavoda Bridge (Danube)	2350	600
Sukkur Bridge (Indus).....	1250	785

The latter has cantilevers each 320 feet long.

Suspension Bridges.—These are bridges in which the roadway is suspended from chains, links, or ropes, passing over piers or towers, and fixed or anchored at their extremities. Another line of evolution had its origin in the principle of suspension. The simplest form, if possible, is a rope, traversed by a pulley, ring, or grooved block of wood, from which a rude car is suspended, or, in some cases, only a loop, in which the passenger sits, and either works himself across with his own hands, or is drawn from side to side by a smaller line

attached to the car. Such elementary bridges have been in use from the earliest ages. More than a hundred and thirty years ago, Don Antonio de Ulloa described them as commonly used in the mountainous districts of South America. Structures of a more bridge-like character were erected by the Peruvians. Six strong cables are suspended across the river, four of which carry the platform, consisting of sticks laid across them, and branches of trees laid longitudinally upon the sticks. The two other ropes are considerably higher than the platform, and are connected with it. They serve as rails for the security of the passenger. Ulloa observes that 'the appearance of the bridges, which move with the wind, and are agitated by the movements of every passenger that crosses them, is very frightful at first.' They cross chasms hundreds of feet deep, through which cataracts of water, derived from the melting snow, rush, lashed into irresistible fury.

Fig. 18.—Suspension Bridge.

Fig. 18 is a typical illustration of a modern suspension bridge. When the weight of the roadway is known by the stress on the suspending links, the problem of statical equilibrium assumes the simplest form, and the conditions of strength and stability are readily determined. But when there is a shifting or rolling load on the roadway, which is heavy in proportion to the weight of the bridge, as, for example, a railway train, the conditions are involved. When the train occupies, say, only one-half of the bridge, the chain is depressed on that side, and is raised on the other side. Thus an undulation is produced in the bridge, which, especially if the train be moving rapidly, may seriously disturb the equilibrium, and even endanger the stability of the bridge. Various combinations have been devised to overcome this difficulty. The simplest and probably the best course is to stiffen the roadway, so that the stress of the passing load may be distributed over a considerable length of the chain. In this manner large railway bridges have been constructed in America—for example, the Roebling's bridge (1855) over the Niagara, 2½ miles below the falls, having a span of 822 feet, and being 245 feet above the level of the stream. A hundred yards higher up is a new cantilever railway bridge (1883).

The Menai Suspension Bridge, designed and constructed by Thomas Telford, was as great a step, in its own time, as its neighbour the tubular railway bridge of Robert Stephenson. After various abortive designs were proposed and abandoned, Telford put forward his plan for crossing the straits by a suspension bridge of one large span, 100 feet high above the water-level. The roadway is suspended from four cables, each consisting of four tiers of bars, making in all sixteen chains, having a drop of 57 feet, or about one-tenth of the span. There are two carriage-ways, each 12 feet wide, with a footpath between them, 4 feet wide. The chains consist of flat bars on edge, 10 feet long, 1 inch thick, and 3½ inches wide, connected to each other by round bolts. The total length of the bridge is 1710 feet, or about one-third of a mile; and the distance between the points of suspension is 579 feet. The total weight of iron used for the structure was 2187 tons. The bridge occupied six years in construction, and was opened in 1825. The

total cost, including the embankment and about half a mile of new line of road, was £120,000.

The success of the Menai Suspension Bridge having been assured, one of a still larger span, 870 feet, at an elevation of 167 feet above the river, was constructed at Freiburg, in Switzerland. The bridge was suspended by wire-ropes, each consisting of eighty wires, $\frac{1}{2}$ inch thick, tied together by coils at intervals. The bridge was finished in 1834. There is a similar, but rather smaller, bridge over the Gotteron, a tributary of the Sarine.

The Clifton Suspension Bridge (fig. 19) has an interesting record. In 1753 William Vick, a Bristol alderman, bequeathed the sum of £1000, to accumulate at compound interest until it reached £10,000, and then to be used in constructing a stone bridge at or near the site of the present Clifton Bridge. This sum was augmented by contributions, and in 1830 an act was obtained for the construction of the bridge, to the design of Mr Telford, having a central span of 400 feet. The work subsequently passed into the hands of Mr I. K. Brunel, a man of large ideas, who made a new design for a single span of 702 feet, at a height of 250 feet above high-water level. The new design was proceeded with in 1836, and the abutments and piers were completed; but, for want of funds, the work was arrested until 1860, when advantage was taken of the removal of the old Hungerford Suspension Bridge, to make room for the Charing Cross Railway Bridge. The chains were bought at a low cost, and in 1861 the works of the Clifton Bridge were resumed, in which the old chains were utilised. In the new bridge there are three chains on each side, supporting longitudinal stiffening girders of wrought-iron, with open-work cross-girders to carry the floor of the bridge. The hand-railing was also ingeniously utilised with lattice-work as a girder to co-operate in stiffening the platform. The span of the bridge, measured between the centres of the piers or towers, is 702½ feet; the width is 31 feet, including 20 feet of roadway defined by the distance apart of the chains, and two footways, one at each side. The roadway is not on a dead level, but between the piers has a rise or arching of 2 feet. The chains, passed over the piers on cast-iron saddles or rollers, are carried downwards to land-saddles at a distance of 196 feet from the piers, bedded on brickwork set upon the solid rock. Sixty feet further the chains are carried down at an angle of 45 degrees to the anchorage-plates, bedded in a mass of brickwork in the form of an arch abutting on the solid rock far below the surface of the ground. All the links were proved with a stress of 10 tons per square inch. The platform is suspended by vertical rods from the chains, and that the stress on the rods may be adjusted and equalised, they are fitted each with a double adjusting screw at the lower end. The roadway is of creosoted timber 5 inches in thickness. The footways are laid with timber of half this thickness. The weight of the chains between the piers is 554 tons; and yet they are subject to a tensional stress of 680 tons at the middle, by their own weight. The suspension-rods, girders, flooring, &c., weigh 440 tons, making, with the chains, a total weight of nearly 1000 tons. It is calculated that, if the bridge be loaded all over

the platform at the rate of 70 lb. per square foot, which is estimated as the maximum weight of a crowd, the final stress on the chains at the middle would amount to 2094 tons, or $4\frac{1}{2}$ tons on each square inch of section of the chains. In order to provide for the effects of expansion and contraction and other causes of disturbance, the two ends of the roadway are furnished with hinged flaps 8 feet long, which give perfect freedom of movement vertically as well as horizontally.

The Brooklyn Suspension Bridge across the East River, between New York and Brooklyn, opened in 1883, is built of steel. It has a central span of 1595½ feet, and two land spans of 930 feet each;

Fig. 19.—Clifton Suspension Bridge.

making, with the approaches, a total length of 5989 feet, or about one mile and one furlong. The anchorage at each end is a solid cubical structure of stone, measuring 119 feet one way, by 132 feet the other, rising to a height of 90 feet above high-water mark, weighing 60,000 tons each. The towers are 276 feet high. The weight of the whole structure suspended between the towers is nearly 7000 tons. The stress of suspension is borne by four cables, of 5000 steel wires each, $1\frac{1}{2}$ inches in diameter. The foundations of the towers were laid by means of caissons and compressed air, at a level of about 80 feet below high-water mark. The roadway presents five parallel avenues, of an average width of 16 feet each. The two outmost avenues, 19 feet wide, are devoted to vehicles; the central avenue, $15\frac{1}{2}$ feet wide, for foot-passengers; and on the two intermediate avenues are laid tramways for car-traffic. For illustration see BROOKLYN.

Movable Bridges.—Movable bridges are usually required in the neighbourhood of rivers, docks, wharves, canals, and like situations, for the passage of ships and boats. They are variously designed and adapted to particular situations, and may be classified as: (1) bascules or drawbridges, (2) swing bridges, (3) traversing bridges, (4) lift bridges, (5) pontoon bridges.

Bascules or Drawbridges.—The bascule bridge is such as is raised by turning, in one piece or in two pieces, round one or two horizontal axes or hinges. The most ancient form of the bascule was that of one flap of framed timber used to cross the moat or ditch of a fortress or castle, and capable of being drawn up by means of chains from the inside. For large dimensions it is convenient to construct the bridge in two halves, lifting from each side, and

abutting together at the middle. An excellent bascule bridge, erected in 1839, on the North-Eastern Railway, across the river Ouse, gives a clear water-way of 45 feet. The bridge is opened by two men, one at each leaf, in about one minute and a half, and is opened about eight times every day. One of the largest bascule bridges is that at Copenhagen, which was opened for traffic in 1867, giving a free passage-way of 56 feet 8 inches. The bridge is counter-weighted with 57 tons load at the end of the tail, which is $13\frac{1}{2}$ feet from the centre of the hinge.

The Tower Bridge, a bascule bridge, across the Thames, at the Tower of London, opened in 1894, is constructed on such a scale as to be the largest bridge in the world of the bascule class. It is illustrated by fig. 20. The bridge may be

Fig. 20.—The Tower Bridge.

described as a compound suspension and bascule bridge of three spans, of which the centre opening is fitted with a bascule or drawbridge, shown lifted in the figure. The bascule is carried by two massive Gothic towers, from which the chains or links are suspended, and in which provision is made for the machinery required for opening and closing the middle span. Lifts at both sides, as well as internal staircases, are provided for the use of foot-passengers. The lifts communicate immediately with the upper footway connecting the towers, so that the foot-traffic is never interrupted. The leaves of the drawbridge, when open, will be flush with the towers, allowing the largest shipping to pass through. When the bridge is closed, there will be sufficient height at high-water for the ordinary traffic of the river to pass under. The bridge has been built of gray granite for the lower portions, hard red brick for the upper portions of the towers. The opening of a passage for vessels, and the closing of the bridge, may be accomplished in the course of four or five minutes. Of the three spans, the clear centre opening for shipping is 200 feet, the side spans are each 270 feet, and the total length between abutments is 800 feet. The headway of the centre span when closed is $29\frac{1}{2}$ feet above Thames high-water, and that of the side spans is 27 feet. The height of the foot-bridge across the centre span is 135 feet above high-water. The approach-roads and the foot-bridge are 60 feet wide. The parliamentary estimate cost of the bridge, including land, is £750,000, or about £940 per lineal foot. The late Sir Horace Jones was

the architect, and Mr J. Wolfe Barry is the engineer.

Swing Bridges.—Swing bridges are by far the most commonly employed of movable bridges. The large rivers to be crossed in America have demanded swing bridges of great span, with excellent contrivances for minimising friction and insuring steadiness when closed. The swing bridge over the Raritan, in New Jersey, U.S., allows two free passages, each 216 feet wide. It is what is known as a double-swing bridge—the bridge being balanced on a central pivot assisted by a system of rollers—opening and closing two passages at once, and affording two passages instead of only one, as in the earlier bridges, which were generally made in two leaves to cross single passages. The Kansas City Bridge crosses two passages, each 160 feet wide. The total moving weight is 303 tons. The bridge is opened by steam-power in about one minute and a half, or by manual power in two minutes. From two-thirds to three-fourths of the moving weight rests on the central pivot.

Traversing Bridges.

—Movable bridges, sometimes called telescope bridges, capable of being rolled horizontally backward, or in an oblique direction, are occasionally employed. The bridge across the Arun, near Arundel, on the South Coast Railway, is 144 feet long. It is traversed on wheels, and acts as a sliding cantilever, the over-

hanging portion resting on the opposite abutment when in place.

Lift Bridges.—These are not common. There appear to be only two—one erected over the Surrey Canal, which is lifted by the four corners; and another over the Royal Canal, Dublin. In the second case, a branch railway crosses the canal at an angle of 25 degrees. The bridge first made for the situation weighed 14 tons, and was balanced by a counterpoise consisting of a tank filled with water, the counterpoise, empty, being 1 ton lighter than the bridge, and when loaded with 2 tons of water, 1 ton heavier. The bridge could thus be raised and lowered with the aid of a man at a winch. The lift of the bridge was $7\frac{1}{2}$ feet, which gave a headway for barges equal to that of the adjoining stone bridge. The supply of water for working the bridge was taken from an adjacent lock. At the four corners rams worked into cylinders, which admitted water from the lock to enter through small holes, and fill the cylinders as the rams were drawn up in the raising of the bridge, acting as a check in case of accident. The bridge has been reconstructed for a greater lift.

Pontoon or Floating Bridges—Bridges of Boats.

—Bridges of boats are made of boats laid over with planks, fastened across the stream by means of anchors or stakes. The bridge at Rouen is 300 yards long, paved with stone for the passage of carriages and horses. The so-called 'flying bridge' is rather a ferry than a bridge of boats (see FERRY).

A well-known pontoon bridge was designed by Mr Mallet to cross the Royal Canal at the Broad-

stone terminus of the Midland Great Western Railway of Ireland. The general idea is that of a pontoon or flat-bottomed boat of iron. When the bridge is in place, water is admitted until it settles down firmly on timber wall-plates. To open it the water is drawn off by a movable siphon, which is connected with a fixed pipe, having a considerable vertical fall. A smaller branch pipe is set at an angle to the exhaust-pipe, and through it a strong jet of water is allowed to issue. This operation, on a well-known principle of hydrodynamics, sucks away the air from the siphon and causes it to act. The bridge then floats, and is drawn into a recess, leaving the passage clear along the canal.

The longest floating bridge in the world, probably, is the pontoon bridge across the river Hooghly, at Calcutta, designed and constructed by Sir Bradford Leslie. The bridge is 1530 feet long between the abutments, and is carried on 14 pairs of pontoons, which are held in position by means of chain-cables, $1\frac{3}{4}$ inches thick, and anchors weighing 3 tons each, laid on the up-stream and down stream sides, 900 feet asunder. By their great length, the cables afford the necessary spring to allow for the ordinary rise and fall of the river, the stress on each cable varying from 5 tons to 25 tons, according to the state of the weather and of the tide, the maximum velocity of which is 6 miles an hour. The pontoons are rectangular iron boxes, having rounded bilges and wedge-shaped ends. They are each of the great length of 160 feet, made of such considerable length in order to obviate pitching motion in rough weather, with a beam of 10 feet, and depth of from 8 to 11 feet, presenting a side of from $3\frac{1}{2}$ to 4 feet above water, according to the state of the traffic. For perfect safety, each pontoon is divided by bulkheads into 11 compartments. They are made of iron plates $\frac{1}{2}$ inch and $\frac{3}{8}$ inch in thickness, riveted together. The platform of the bridge is supported by tressel-work on the pontoons at a clear height of 27 feet above the water—a convenient height for boat navigation. The roadway platform is of 3-inch planks of teak-wood from Burma, forming a roadway 48 feet wide, with a footpath at each side, 7 feet wide. An opening 200 feet wide, for the passage of ships, is made by removing, when occasion requires, four of the pontoons with their superstructure, and sheering them clear of the opening. The portion so removed is in two divisions, which are separately secured, right and left, and when in place, are connected by draw-bridges with the fixed portions of the bridge. Before launching, the pontoons were ballasted sufficiently to make them float upright; and were afterwards coupled in pairs by the cills of the main trusses, when the ballast was removed. The floating bridge is connected with the shore at each end by adjusting ways hinged to the shore. The ordinary time taken to open the bridge is 15 minutes; and to close it, 20 minutes. It is only opened twice a week. The bridge cost £182,000, or about £120 per lineal foot.

MILITARY BRIDGES are temporary constructions to facilitate the passage of rivers by troops, to restore a broken arch, or cross a chasm of no very great width. Those over a river are either floating or fixed. The former are made of pontoons (q.v.), boats, casks, rafts of timber, or anything that will give sufficient buoyancy, and the latter of piles, tressels, or other timber work. Spars, ropes, and planks are used in a variety of ways for spanning narrow chasms. The pontoon bridge is the only one which is carried with an army. Enough material for 100 yards of length accompanies each army corps. All military bridges have their roadway formed in the following manner: five to nine road-bearers of stout timber support *chessers* or flat planks 10 feet long, held in position so as to

form a level surface, by two *ribands* placed above them and over the outer road-bearers, to which they are fastened by *rack-lashings*. The road-bearers are supported by the pontoons, casks, boats,

Military Bridge.

tressels, or piles, which form the piers, usually 10 to 15 feet apart, or by transoms on the ropes in the case of suspension bridges. To prevent injury to the boats, barks of timber are built up along the keel of each for the road-bearers to rest upon. A *saddle* on pontoons and *gannets* on casks answer the same purpose, and in the latter case keep the casks together by being lashed to them. The maximum loads such bridges are usually calculated to bear are, for infantry, 5 cwt. per lineal foot; for cavalry, 2 cwt.; for field artillery, with two horses per gun only, $4\frac{1}{2}$ cwt. Heavy guns are better warped across on specially constructed rafts. A *flying bridge* is a boat or raft anchored by a long cable up-stream, and carried across by the action of the current acting obliquely against its side, which should be kept at about an angle of 55 degrees with the current.

Of the rock formations called *Natural Bridges*, the most remarkable is the natural bridge over Cedar Creek, in Virginia, U.S., 125 miles W. of Richmond. The mass of siliceous limestone through which the little river passes is presumably all that remains of a once extensive stratum. The cavern or arch is 200 feet high and 60 feet wide. The solid rock walls are nearly perpendicular, and the crown of the arch is 40 feet thick.

Gwilt, *An Encyclopedia of Architecture* (1867); J. A. L. Waddell, *Iron Highway Bridges* (1884); C. B. Bender, *Design of Metallic Bridges* (1885); Henry Law and D. K. Clark, *Civil Engineering* (1881); J. Claxton Fidler, *A Practical Treatise on Bridge Construction* (1887); and the *Minutes of Proceedings of the Institution of Civil Engineers*.

Bridge-head, or TÊTE-DU-PONT, is an arrangement of defensive works on the far bank of a river which runs at right angles to the line of advance

Bridge-head Defense Work.

of an army. It consists of a central work immediately covering the bridge or bridges, and a line of detached redoubts, on a wide area, at some distance from it. Thus, the enemy's artillery fire is prevented from reaching not only the bridge itself,

but also the wide space behind the redoubts upon which the troops can deploy without molestation after crossing the river. The ground in front of the redoubts is swept by batteries placed on the hither bank, and therefore a bridge in the centre of a re-entering bend of the river is well placed for such defence.—A double bridge-head has a similar system of works on each bank. It is necessary when, the course of the river being in the same direction as the line of advance, it is desired to retain the power of manœuvring on either bank.

Bridgenorth. See BRIDGNORTH.

Bridge of Allan, a beautiful village on Allan Water, 3 miles N. of Stirling by tram. Sheltered by the Ochils, it owes its prosperity partly to the mineral saline wells of Airthrey, and partly to its delightful situation and mild climate, which render it a favourite resort of invalids, especially in spring and autumn. There are excellent hotels, abundance of good lodgings, four churches, and the Macfarlane Museum (1887). Pop. (1861) 1803; (1891) 3207.

Bridgeport, a city and port of entry of Connecticut, U.S., at the mouth of the Pequannock, which empties itself into an inlet of Long Island Sound. It is 53 miles SW. of Hartford, and 57 NE. of New York. Bridgeport is connected by railways both with the interior and with several important towns on the seaboard. It has a safe harbour for small vessels, a considerable coasting trade, several fine public parks, and a system of street railways. The city is modern and well built, and the streets are shaded by trees; the elevation, called Golden Hill, commanding fine views of the sound and shore, is covered with good residences, many of the inhabitants belonging to New York. Its manufactures are extensive, particularly of carriages, harness, machinery, metallic cartridges, and sewing-machines. Pop. (1870) 18,869; (1880) 27,643; (1890) 48,866.

Bridget, St (properly *Birgitta*, afterwards transposed to *Brigitta*), a famous Roman Catholic saint, was born at Finstad, in the district of Upland, in Sweden, in 1302 or 1303. Her parents were of the blood-royal of Sweden. When only fourteen she married Ulf Gudmarson, afterwards 'Lagnan' (provincial judge) of Nerike, a youth of eighteen, by whom she had eight children. She was for some years mistress of the royal household, and afterwards made pilgrimages to the shrines of St Olaf at Trondhjem, and of St Jago de Compostella in Spain. On their return, Ulf died in 1344, and Bridget founded about the same time the monastery of Wadstena, in East Gothland. Sixty nuns and seventeen monks, with eight lay-brothers, were its first inmates. They received the rule of St Augustine, to which St Bridget herself added a few particulars. They constituted a new order, sometimes called the order of St Bridget, sometimes the order of St Salvator, or the Holy Saviour, which flourished in Sweden until the Reformation, when it was suppressed. The order has had no fewer than seventy-four establishments scattered throughout Europe, from Finland to Spain, but has now only a few representatives in Spain, Bavaria, and Belgium. In 1349 St Bridget went to Rome, where she founded a hospice for Swedish students and pilgrims. After having made a pilgrimage to Palestine, she died at Rome on her return, 23d July 1373. Her bones were carried to Wadstena, and she herself was canonised in 1391 by Pope Boniface IX. Her festival is on the 8th of October.—Her daughter Catharine, born about 1335, died in 1381, and was canonised in 1489. She is distinguished as 'St Catharine of Sweden.' The *Revelationes St Brigittæ*, written by her confessors, was keenly attacked by the celebrated Gerson, but

obtained the approval of the Council of Basel, and has passed through many editions, of which the earliest appeared at Rome in 1474, and the best at Lübeck in 1482. Besides the *Revelationes*, there have been attributed to this saint a sermon on the Virgin, and fifteen discourses on the passion of Jesus Christ. See Hammerich, *Den Hellige Birgitta og Kirken i Norden* (1863).

Not to be confounded with this Swedish saint is the Irish St Brigit, or Bride of Kildare (453–523). It is tolerably certain that she was the daughter of one Dubtach at Fochart Muirthemne, in Leinster, entered a monastery at Meath in her fourteenth year, through her extraordinary piety and beneficence gained great fame and influence, and founded four monasteries, the first and chief of these at Kildare, where, after her death, she was buried, and a perpetual fire was kept up in her memory. The rest of her traditional history is a mass of astonishing miracles, and it is supposed that many of these, along with the sacred fire (which was abolished by the bishop of the diocese in 1220), were transferred to St Brigit from the heathen goddess Ceridwen, the Celtic Ceres, on the ruins of whose chief sanctuary the monastery at Kildare was built. In many old legends and hymns she is celebrated as the 'Maria Hibernorum,' and in the *Officium St Brigidæ* (Paris, 1622) as 'Altera Maria.' Her day falls on the 1st of February. She was regarded as one of the three great saints of Ireland, the others being St Patrick and St Columba. She was held in great reverence in Scotland, and was regarded by the Douglasses as their tutelary saint. The earlier Lives of St Bridget are collected in Colgan's *Trias Thaumaturga* (1647). See *Transactions of the Royal Irish Academy*, iii. 75, and Dr J. H. Todd's *Book of Hymns of the Ancient Church of Ireland* (Dublin, 1855).

Bridgeton, a city and port of entry in New Jersey, U.S., on both sides of Cohansey Creek, navigable up to this point, 38 miles S. of Philadelphia. The town contains the West Jersey Academy, South Jersey Institute (1870), more than a dozen churches, a public library, several newspaper offices, an iron-foundry, a rolling-mill, a nail-factory, a glass-work, and has manufactures of woollen goods, leather, carriages, machinery, and canned fruits. The surrounding region is well cultivated and fertile. Pop. (1870) 6820; (1880) 8729; (1890) 11,424.

Bridgetown, the capital of Barbadoes (q.v.), is situated on the west coast of the island along the north side of Carlisle Bay, which forms its roadstead. The inner harbour is protected by a breakwater known as the Mole Head. Founded in 1628, the town took the name Indian Bridge, and later its present appellation, from a rude aboriginal structure which spanned a neighbouring creek. The town was almost destroyed by fire in 1666, and again in 1766. In 1831 a part of Bridgetown was destroyed by a hurricane, and in 1845 it again suffered severely from fire. It is the residence of the Bishop of Barbadoes, has a college, several high-class schools, town-hall, government buildings, hospital, water-works, and jail. To the south are the barracks, with parade-ground and arsenal. A railway of 23 miles in length to the parish of St Andrew was completed in 1882. Pop. (1891) 21,000.

Bridgewater, FRANCIS EGERTON, third DUKE OF, the 'father of British inland navigation,' was born in 1736, and succeeded his elder brother as duke in 1748. In 1762–72 he constructed, after the plans of the celebrated Brindley, the earliest canal in England, 42 miles long, uniting Worsley with Manchester and Runcorn on the Mersey above Liverpool. The canal crossed the

Irwell by an aqueduct 39 feet high and 600 feet long. The duke exhausted his credit to the utmost on his undertaking, nobly restricting himself to the simplest fare for the sake of his idea, but his far-sightedness was equal to his public spirit, and great wealth ultimately flowed in upon him. The success of this canal gave an impulse to the internal navigation of England, and led to the extension of the canal-system throughout the kingdom. In 1873 the Bridgewater Canal was purchased from Lord Ellesmere for £989,612, including the plant, valued at £150,000; and in 1887 it was resold to the Manchester Ship Canal Company for £1,710,000. The duke took little part in politics, but belonged to Pitt's party. He died unmarried, March 8, 1803, and with his death the dukedom became extinct.

Bridgewater. FRANCIS HENRY EGERTON, EARL OF, son of John Egerton, Bishop of Durham, grandnephew of the first Duke of Bridgewater, was born 11th November 1758, and succeeded his brother as eighth earl, October 21, 1823. Educated for the church, he had previously been prebendary of Durham. He died unmarried, February 11, 1829, and the title became extinct. By his last will, dated February 25, 1825, he left £8000, invested in the public funds, to be paid to the author of the best treatise 'On the Power, Wisdom, and Goodness of God, as manifested in the Creation,' illustrating such work by such arguments as the variety and formation of God's creatures in the animal, vegetable, and mineral kingdoms, the effect of digestion, the construction of the hand of man, and by discoveries, ancient and modern, in arts, sciences, and the whole extent of literature. The then president of the Royal Society of London, Davies Gilbert, to whom the selection of the author was left, with the advice of the Archbishop of Canterbury, the Bishop of London, and a friend of the earl, resolved that the money should be allotted to eight different persons for eight separate treatises. The earl also left upwards of £12,000 to the British Museum, the interest to be employed in the purchase and care of MSS.

THE BRIDGEWATER TREATISES are: (1) *The Adaptation of External Nature to the Moral and Intellectual Constitution of Man*, by Thomas Chalmers (1833); (2) *Chemistry, Meteorology, and Digestion*, by William Prout, M.D. (1834); (3) *History, Habits, and Instincts of Animals*, by Kirby (1835); (4) *Geology and Mineralogy*, by Dean Buckland (1837); (5) *The Hand, as evincing Design*, by Sir Charles Bell (1837); (6) *The Adaptation of External Nature to the Physical Condition of Man*, by J. Kidd, M.D. (1837); (7) *Astronomy and General Physics*, by Whewell (1839); (8) *Animal and Vegetable Physiology*, by P. M. Roget, M.D. (1840). All these works were afterwards republished in Bohn's Scientific Library.

Bridgman. LAURA. This famous blind-mute was born in Hanover, New Hampshire, U.S., on the 21st December 1829. She was a bright, intelligent child, but at two years of age was seized with a violent fever, which utterly destroyed sight, hearing, and sense of smell, while her sense of taste was also impaired. For a time this so shattered her system that there seemed no hope of recovery; but she rallied, and soon learned to find her way about the house and neighbourhood, and even learned to sew and to knit a little. At the age of eight Dr Howe of Boston undertook her care and education at the Perkins Institution for the blind. The first attempt was to give her a knowledge of arbitrary signs, by which she could interchange thoughts with others. Then she learned to read embossed letters by the touch; next, embossed words were attached to different

articles, and she learned to associate each word with its corresponding object. Thus far, however, the work was only an exercise of imitation and memory; but at last the truth flashed upon her, that by this means she could communicate to others a sign of what was passing in her own mind. Her whole being seemed changed. The next step was to procure a set of metal types, with the letters cast at the ends, and a board with square holes for their insertion, so as to be read by the finger. In three months she could write down the name of most common objects, and in two years had made great bodily and mental improvement. She grew happier, and enjoyed play like other children, amusing herself with imaginary dialogues. Her touch grew in accuracy as its power increased; she learned to know people almost instantly by the touch alone. In a year or two more she was able to receive lessons in geography, algebra, and history; and learned to do needlework and various household duties. She received and answered letters from all parts of the world, and was always employed, and therefore always happy. She learned to write a fair, legible, square hand, and to read with great dexterity, and at last, even to think deeply on religious and other subjects, and to reason with good sense and discrimination. She afterwards became skilful as a teacher of the blind and deaf and dumb. Dickens gives an account of her in *American Notes*; and see a work on her life and education by her teacher, Miss Lamson (Boston, 1878). She died 24th May 1889.

Bridgnorth (formerly *Brug* or *Bruges*=Bridge), a municipal borough of Shropshire, 19 miles SE. of Shrewsbury. The Severn divides it into the upper or 'High Town,' and lower or 'Low Town.' The former is built on a red sandstone rock rising 180 feet above the right bank of the river. This rock was formerly crowned by a royal fortress, a huge leaning fragment being all that now remains of the keep. The walk round the castle-hill was said by Charles I. to be 'the fairest in his dominions.' Bridgnorth has two parish churches, a grammar-school existing in Henry VIII.'s reign, carpet, worsted, and tanning industries, and agricultural trade. Until 1868 it sent two members, and until 1885 one member, to parliament. The Danes wintered here in 896, and the site of a Saxon castle, built by the princess Ethelfleda, is still distinctly marked. Early in the 12th century, Robert de Belesme (a kinsman of the Conqueror) built the Norman castle, and unsuccessfully defended it against Henry I. It was also besieged by Henry II. and Edward II. According to Shakespeare (*Henry IV., Part I.*, III. iii.), Bridgnorth was the meeting-place of the royal forces before the battle of Shrewsbury; and, according to Clarendon, before the battle of Edgehill. The castle was demolished by the Parliamentarians after a three-weeks' siege, during which the 'High Town' was destroyed by fire, one of the few houses surviving being the fine old Tudor mansion, still standing, in which Bishop Percy was afterwards born (1728). To recompense the inhabitants, Charles II., by proclamation, authorised them to make a special collection in every church throughout the kingdom. High Town and Low Town are connected by an inclined railway (1892). Pop. (1861) 5876; (1891) 5865.

Bridgwater. a municipal borough and seaport town of Somersetshire, on both sides of the Parret, 6 miles in a direct line, and 12 by the river, from the Bristol Channel, and 29 miles SW. of Bristol. It stands on the border of a plain between the Mendip and Quantock Hills, in a well-wooded country. It is chiefly built of brick, and an iron bridge connects it with the suburb of Eastover. St Mary's Church has a remarkably graceful

spire, and contains a fine altar-piece. The Parrot admits vessels of 700 tons up to the town; it rises 36 feet at spring-tides, and is subject to a bore or perpendicular advancing wave, 6 or 8 feet high, often causing much annoyance to shipping; a canal gives water communication with Taunton. Bath or seaming bricks, of which Bridgwater has a monopoly, are made here of a mixture of sand and clay found in the river, and there are carriage-works and potteries. Coal, grain, wine, hemp, tallow, and timber are imported; while bath-bricks, earthenware, cement, and agricultural produce are exported. The Conqueror granted the manor to one Walter de Donay, and its name thereupon became *Burgh-Walter*, of which *Bridgwater* is a mere corruption. A castle was built here in the reign of John, and an Augustinian abbey about 1230. Admiral Blake was a native of this town, which suffered severely in the civil wars, when besieged for a whole week by Fairfax, and forced to surrender, the castle being dismantled. The battle of Sedgemoor (q.v.) was fought in 1685 near Bridgwater, whose corporation had proclaimed the Duke of Monmouth as king. Bridgwater formerly returned two members to parliament, but was disfranchised in 1870. Pop. (1851) 10,317; (1891) 12,419. See the history of the town by S. J. Jarman (1889).

Bridle and Bit, that part of a horse's harness which is attached to the head and mouth, by means of which he is governed and restrained. The proper biting of horses has been a matter of much study in England, and innumerable kinds of bits have been introduced for the purpose. It will be sufficient for our purpose,

Fig. 1.

a, headstap; b, front; c, check-piece; d, throat-band; e, nose-band; f, reins.

however, to describe only a few of those most generally used. The ordinary single riding-bridle, with a snaffle-bit, is shown in fig. 1. The driving-bridle is similar in principle, with, generally, the addition of *blinkers*—i.e. pieces of leather fastened to the cheek-pieces of the headstall to prevent the horse seeing in any direction except straight forward; the theory being that he would be startled by anything catching his eye from behind. There are several forms of the snaffle-bit. The common riding form (fig. 2, a) is a round smooth bit, jointed in the middle, attached at either side to straight bars or cheeks, which prevent the bit being pulled through the horse's mouth, and with rings to which the reins and cheek-pieces of the headstall are fixed. The twisted snaffle has the mouthpiece twisted or fluted, increasing its severity on the horse's mouth. The ring snaffle is made without cheeks; and the rings for headstall and reins are not fixed, but work loose in holes at the ends of the mouthpiece. Another form which is very generally used, especially in driving, is the double-ring snaffle (fig. 2, b), having two rings at either end, one working within the other, to one of which the reins are fastened, and to the other the headstall. The snaffle being jointed, its action is to press on the sides or *bars* of the lower jaw, and not on the tongue, while its shape prevents anything like severity.

The double or Weymouth bridle is generally used in the hunting-field and often for ordinary purposes.

It has two separate bits, the snaffle and curb, or bridoon and bit, each having separate headstalls and reins. The snaffle or bridoon is like the plain ring snaffle already described. The bit or curb (fig. 2, c) has a fixed unjointed mouthpiece having

Fig. 2.

an upward curve, or *port*, of varying size, in the centre, which answers the same purpose as the joint in the snaffle of confining the pressure of the bit to the *bars*, where it is most effective. Hooks are fixed to the upper end of the cheeks, on which the curb-chain is hung, and which is passed round the chin-groove under the horse's under-jaw. To the lower end the curb-reins are attached; the other reins are fastened to the bridoon-rings. One advantage of the double bridle is that its action can be varied according as the curb or snaffle rein is tightened or relaxed. Military bridles are double, and generally similar to that just described, except that the cheeks are made in the form of the letter S, and other ornamentation added.

The Pelham is an extensively used modification of the double bridle. It consists of a single bit (fig. 2, d) similar in form to the curb-bit of the double bridle, but with the addition of rings fixed to the cheeks at either end of the mouthpiece to which reins are attached, in addition to those fixed to the lower end. The curb-chain is adjusted as in the double bridle. The running martingale is an arrangement applicable to any bridle, by which a pair of reins run through rings at the ends of two straps attached to the horse's girth to prevent him throwing his head up.

In connection with driving-bridles, two questions have in recent years caused considerable discussion—viz. *bearing-reins* and *blinkers*. The bearing-rein, in its simple form, is intended as a support to the horse's head, and consists of a strap buckled to the ring of the bridoon-bit of a double bridle, passed through a swivel on the throat-band, and fastened to a ring on the saddle-pad. In its severe form, known as the 'gag,' it is attached to the headpiece, passes through the bridoon-ring, through a swivel on the throat-band, and then to the saddle. The effect is to cramp the horse's neck, and prevent him throwing his nose forward, but it is supposed to improve his appearance in a carriage. The opponents of the bearing-rein complain of the torture unnecessarily inflicted on the horse, and hold that nature supplies all the support necessary for the head. The blinker question is not so important, and consists of a difference of opinion as to whether a horse would or would not be more easily startled with his eyes uncovered.

In European nations and in North America, the bridles used are generally similar to those described; but among the Arabs and in South America and some parts of Mexico and Texas, a heavy, old-fashioned, and terribly cruel curb-bit is used. On the other hand, the stockmen of the Australian bush employ the plain snaffle-bridle alone, with which they manage their powerful and usually half-broken horses easily, an equal tribute to the

sufficiency of the snaffle and their own horsemanship.

It is interesting to know that in the representations of harnessed horses in the Assyrian sculptures the bridle generally shown is apparently almost

Fig. 3.

identical with the modern snaffle. Fig. 3 represents a chariot horse with bridle (Koyunjik); a, a bronze bit from Nimroud. See Major Dwyer's *Seats and Saddles, Bits and Bitting*; Stonehenge's *Horse in the Stable and Field*. See also HORSE, RIDING AND DRIVING.

Bridlington, or BURLINGTON, a town in the East Riding of Yorkshire, 6 miles SW. of Flamborough Head, and 23 SSE. of Scarborough. An old-fashioned place, with narrow irregular streets, and with a considerable trade in corn, it is supposed to have been the site of a Roman station. From 1664 till 1753 it gave title of Earl of Burlington in the peerage of England to the Boyle Earls of Cork. An Augustinian priory of immense wealth, founded in the reign of Henry I., is represented by the nave of its splendid church, which, mixed Early English and Perpendicular in style, was restored by Sir Gilbert Scott in 1857. On Bridlington Bay, a mile to the south-east, is Bridlington Quay, the port of the town, which has risen into repute as a watering-place, has fine sands, a parade, ornamental gardens, a chalybeate mineral spring, and hot and cold baths. The bay has good anchorage, and the harbour is inclosed by stone piers. In 1643 Henrietta, queen of Charles I., landed here from Holland with arms and ammunition bought with the crown-jewels, when Bridlington was cannonaded for giving her refuge. Bridlington is noted for its chalk-flint fossils. Hundreds of windbound vessels may sometimes be seen in Bridlington Bay, stretching north to Flamborough Head, which affords good shelter and anchorage. Pop. (1861) 5775; (1891) 8916.

Bridport, a municipal borough of Dorsetshire, at the confluence of the Asker and the Brit, 2 miles from the English Channel, and 16½ W. of Dorchester by rail. It stands on an eminence surrounded by hills, and consists chiefly of one spacious street running east and west, and of another stretching towards the sea. It has a town-hall (1785), and a good cruciform parish church (restored in 1865). Till 1867 Bridport returned two members to parliament; and till 1885, one. The chief manufactures are ropes and cordage (a 'Bridport dagger' was proverbial for a halter in Leland's day), besides twine, shoe-thread, fishing-nets, and sailcloth. Bridport was a considerable town before the Norman Conquest, and had a mint for coining silver. Vessels of 250 tons can enter the harbour, which is 1½ mile below the town; and there is some foreign and coasting trade, timber, coal, and flax being imported. Pop. (1861) 7719; (1891) 6611.

Brief, or BREVE, PAPAL (from Lat. *brevis*, 'short'). The word breve was originally used in

the Low Latin of the middle ages for ecclesiastical documents of various kinds—e.g. for inventories of church goods. It now signifies such papal documents as are issued without some of the solemnities proper to bulls, and which assumed a recognised name and form in the 15th century. They were introduced in order to lighten the work of the papal chancery. The brief is written on a sheet of thin white parchment, of greater breadth than height, in current Latin characters. It has a stamp of red wax bearing the impress of the fisherman's ring—i.e. a figure of St Peter hauling in his net, surmounted by the name of the pope. The name of the pope also appears on the first line of the brief, then follows 'Dilecte fili (or the like), salutem et apostolicam benedictionem,' 'In perpetuum,' &c., being sometimes added as in bulls. It ends with the words 'given at Rome at St Peter's under the ring of the fisherman,' followed by the day of the month (not as in bulls according to the old Roman, but according to the modern mode), the year of the Christian era and of the pontificate. It is subscribed by the secretary of briefs. A comparison with the article BULL will show the difference between the two kinds of documents, which has been considerably lessened by the legislation of Pope Leo XIII.

Brief, in the practice of the English bar, is the name given to the written instructions on which barristers advocate causes in courts of justice. It is called a brief because it is, or ought to be, an abbreviated statement of the pleadings, proofs, and affidavits at law, or of the bill, answer, and other proceedings in equity, with a concise narrative of the facts and merits of the plaintiff's case, or the defendant's defence. Probably, when pleadings were entirely oral, nothing was handed to counsel except the brief or writ originating the action. The brief is often called 'observations' in Chancery proceedings. In Scotland, the corresponding term is *Memorial Breve* (q.v.) in Scotland has a different meaning. This paper should be confined to the statement of facts without argument or quotation. —*Kings' Briefs* were royal mandates ordering collections to be made in chapels for building churches, relieving sufferers by fire, refugees, and suffering Protestants abroad. See Walford, *Kings' Briefs* (1882).

Brieg, a town of Prussian Silesia, on the left bank of the Oder, 27 miles SE. of Breslau by rail. The principal building is the 13th-century church of St Nicholas, with a splendid organ, and with towers added in 1884-85. Brieg is a thriving town, its manufactures including machinery, ironwares, thread, fringe, sugar, leather, and tobacco. The battlefield of Mollwitz (q.v.) lies a little to the west. Pop. (1871) 15,367; (1891) 20,154.

Briel, or BRIELLE, sometimes THE BRILL, a fortified seaport town of South Holland, situated on the north side of the island of Voorn, near the mouth of the Maas. It contains a government arsenal and military magazines, and possesses a good harbour. The tower of St Peter's Church serves as a lighthouse. Pop. 4286, most of the men engaged as pilots and fishermen. Briel may be considered as the nucleus of the Dutch republic, having been taken from the Spaniards by William de la Marek in 1572. This event was the first act of open hostility to Philip II., and paved the way to the complete liberation of the country from a foreign yoke. The celebrated admirals De Witt and Van Tromp were natives.

Brienne-le-Château, a town of 1800 inhabitants in the French department of Aube, on the right bank of the river Aube, 35 miles ENE. of Troyes. At the military school here (suppressed in 1790) the great Napoleon spent five years. Here,

too, he was defeated by the allies, after a desperate struggle in the last days of January 1814. This victory opened the way to Paris, and led to the fall of the empire.

Brienx, a Swiss town, beautifully situated at the foot of the Bernese Alps, on the north-east shore of the lake of the same name, 30 miles ESE. of Bern. Pop. 2531.—The pretty lake of Brienx, which is $8\frac{3}{4}$ miles long and $1\frac{1}{2}$ in breadth, is an expansion of the river Aar, and is believed to have been at one time united with Lake Thun. It lies 1857 feet above the sea, is 859 feet deep at one point, and is surrounded by lofty mountains, the principal of which is the Rothorn. The Giessbach Cascades, a series of fine falls, are now rendered accessible by a cable tramway. A small steamer plies on the lake.

Brierly Hill, a town of Staffordshire, $2\frac{1}{2}$ miles NE. of Stourbridge. It is a place of much activity, the district abounding in coal, iron, and fireclay; and there are here numerous collieries, large iron-works, glass-works, brick-works, and potteries. Pop. (1871) 11,046; (1891) 11,847.

Brig, **Brig'antine**. A brig is a square-rigged vessel with two masts. A brigantine, or hermaphrodite brig, is a two-masted vessel, with the mainmast of a schooner and the foremast of a brig.

Brig.

A brig's mainsail is the lowest square-sail on the mainmast, whereas the mainsail of a brigantine is a fore-and-aft sail like that of a schooner.

Brigade, in its proper military sense, is a tactical group of regiments or battalions acting together under one commander, called a Brigadier-general (q.v.). In most European armies an infantry brigade consists of two regiments, each of three battalions; but in the British army it has only three battalions. There are three regiments of cavalry in all cavalry brigades. A brigade in this sense has no existence during peace in Great Britain or the United States, except at camps of exercise, such as Aldershot (q.v.), and temporarily for drill purposes; but the word is applied to a group of Batteries of Artillery (q.v.), for administrative purposes, to the household troops, Life-guards, Horse-guards, and Foot-guards, which are sometimes called the *Household Brigade*, and to the four battalions of rifles, called the *Rifle Brigade*. In India there are 28 brigade commands. These are territorial—the officers in charge, who are colonels, having under them all the troops quartered in their districts, whose numbers and nature may vary from time to time. In the United States the brigade consists of two regiments, each of two battalions.

Brigade-major is a military staff-officer who exercises duties, in a brigade, analogous to those of the adjutant of a regiment. When regiments or battalions are brigaded, a brigade-major is appointed as staff-officer to the brigadier. He superintends all correspondence, having a regular office and staff of clerks, issues orders from the brigadier, keeps the rollster or roster of duties, inspects guards and pickets, and directs exercises and evolutions. In the British army he is either appointed for five years, as at the camps of exercise, or holds the appointment only so long as the troops are brigaded, afterwards reverting to regimental duty, as is the case on active service and during autumn manoeuvres.

Brigadier, or **BRIGADIER-GENERAL**, is the commander of a Brigade (q.v.). His rank in the United States army is next below major-general, but in most foreign armies and in the British army when on active service it is that of major-general. The infantry brigades at Aldershot, the troops at Chatham, the Curragh, and Belfast, are also under major-generals holding the rank of brigadier-general. But when battalions are temporarily brigaded, the command is often given to the senior colonel, who becomes the brigadier for the time being, and reverts to the command of his battalion when the brigade is broken up. In India, the sub-districts called brigade commands are under colonels with the temporary rank of brigadier-general, which they hold for a term of five years, or until promoted to major-general.

Brigandine, a coat of mail worn during the middle ages, made of small plates of iron, sewed upon quilted linen or leather, and covered with a similar substance to hide the glittering of the metal. The brigandine was named after the *Brigands*.

Brigands (Ital. *brigante*, from *briga*, 'an intrigue or quarrel'), a name originally given to the mercenaries who held Paris during King John's imprisonment (1358), and who made themselves notorious for their ill-behaviour. It was applied by Froissart to a kind of irregular foot-soldiery (see **BRIGANDINE**), and from them was transferred to simple robbers; it is now used especially of such of these as live in bands in secret mountain or forest retreats. In this sense, the pest has been common to most countries, by whatever name the robbers may have been known—whether the escaped slaves and gladiators of Rome, the pre-Islamite brigands of Arabia, English outlaws and highway-men, German robber-nobles, the later banditti of Mediterranean countries and of Mexico, American stagecoach robbers, Australian Bushrangers (q.v.), or the dacoits and hill-robbers of Asia. It has ever flourished under weak or corrupt governments, and patriotism at times has swelled its ranks, always largely recruited from those disposed readily to join in any political movement, and has transformed them into guerilla companies, who have carried on a bitter warfare against the invader. Such Spanish bands harassed the French during the Peninsular war; in Italy, the Austrian troops were frequently engaged in expeditions against the banditti led by the daring Bellino ('Il Passatore'); and in Greece, the Klephts rendered brave and worthy service in the war of independence. In Cuba, in 1888, political discontent was made the excuse for the brigandage then rampant in the island, where four provinces were on this account declared in a state of siege. Religious persecution also has encouraged brigandage; in Bosnia, which has always produced the most perfect specimens of bandits, it was formerly very common, the unhappy Christians, who were reduced by the Turks to the condition of serfs, frequently taking to the mountains in despair, and thence wreaking vengeance on their oppressors. Gener-

ally speaking, in countries with a notably scanty population, which is yet in many districts as notably overcrowded, brigandage will be found still in existence. Vigorous steps have been taken during the last fifty years to repress the practice, and in some countries with signal success. In Greece, organised companies of brigands, as distinguished from bands of highway robbers fortuitously collected, have disappeared; and in Italy, the chiefs with whom princes made treaties are found only in history. Nevertheless, brigandage is by no means obsolete. In Hungary, where it has flourished from time immemorial, and where even the free towns in the 15th century enrolled companies for organised rapine, and thus raised it to the height of an institution, it has found a stronghold in the shades of the Bakony Forest, whose swineherds are said to be in league with the *betyars*, and even to do an occasional stroke of business on their own account. In Sicily it is to be feared that this is still the only trade which really prospers in the island (see *MAFIA*); and the bands that infest the Turkish frontier are notoriously dangerous to the wayfaring merchant and the defenceless tourist. In 1887 special attention was attracted by the boldness of brigands in the Pyrenees, Tuscany, Servia, Macedonia, Asia Minor, and Mexico; and from the United States several cases of train-robbery were reported.

Brigantes, the most powerful of the old British tribes, inhabiting the country between the Humber and the Roman wall. See *BRITANNIA*.

Brigantine. See *BRIG*.

Briggs, HENRY, a distinguished mathematician, was born in 1561, at Warley Wood, near Halifax, Yorkshire, and studied at St John's College, Cambridge. He took the degree of B.A. in 1581, that of M.A. in 1585, and obtained a fellowship in 1588. In 1592 he was appointed reader of the Physic Lecture founded by Dr Linacre, and in 1596 first reader in geometry at Gresham House (afterwards College), London, and in 1619 first Savilian professor of Astronomy in Oxford. This office he retained till the time of his death, which took place at Oxford, January 26, 1631. Briggs made an important contribution to the theory of logarithms, of which he constructed invaluable tables. Napier the inventor had in 1614 published a table of the so-called natural logarithms, when Briggs observed that another system, in which the logarithm of 10 should be taken as unity, would afford great facilities of calculation. In 1616 he visited Napier at Edinburgh to discuss the suggested improvement, and again in the following year, when Napier admitted the improvement on his own system. He published his *Logarithmorum Chilias Prima* in 1617, containing the first thousand natural numbers calculated to eight decimal places. He was also the author of a tract on the *North-west Passage to the South Seas*, by way of Virginia and Hudson Bay (1622); and in 1624 he published his *Arithmetica Logarithmica*, the fruit of many years of unwearied application, and giving the Logarithms (q.v.) of 30,000 natural numbers to fourteen places of figures, besides the index. His system of logarithms is that now commonly adopted. He next employed himself on a Table of Logarithms of sines and tangents, carried to the hundredth part of a degree, and to fifteen places, which, with a table of natural sines, tangents, and secants, was printed at Gouda, in Holland, in 1631, and published in London in 1633, under the title of *Trigonometria Britannica*. The Greek epitaph written on him by Henry Jacobs, finishes by saying that his soul still astronomises and his body geometrises.

Bright, JOHN, a politician, first brought into notice by the Anti-Corn-Law agitation,

son of Jacob Bright, a cotton-spinner and manufacturer at Rochdale, Lancashire, was born at Greenbank, near that town, November 16, 1811. The family were members of the Society of Friends, and Bright was educated at a Friends' school at Ackworth, and afterwards at York and at Newton. While in his father's factory he took a great interest in public questions, and before he had attained his majority spoke upon such subjects as capital punishment, church rates, temperance, and parliamentary reform. In 1835 he made a foreign tour, which included a journey to Palestine, and on his return delivered before a literary institution at Rochdale, of which he was one of the founders, lectures on the subject of his travels, and on topics connected with commerce and political economy. When the Anti-Corn-Law League was formed in 1839 he was one of its leading members, and, with Cobden, engaged in an extensive Free-trade agitation throughout the kingdom. In the spring of 1843 he offered himself as a candidate for the representation of Durham, and though at first unsuccessful, he became in July of the same year M.P. for that city. At all times an animated and effective speaker, Bright was incessant, both at public meetings and in parliament, in his opposition to the Corn Laws, until they were finally repealed. In 1845 he obtained the appointment of a select committee of the House of Commons on the Game Laws, and also one on the subject of cotton cultivation in India. An abridgment of the evidence taken before the former, published in one volume, contained from his pen an *Address to the Tenant Farmers of Great Britain*, strongly condemning the existing Game Laws. At the general election of 1847 he was elected one of the members for Manchester. He co-operated with Cobden in the movement in favour of financial reform. On the formation of the first Derby ministry, February 27, 1852, Bright aided in the temporary reorganisation of the Corn-Law League, in favour of the principles of Free-trade; and at the general election which followed, was re-elected for Manchester. Like Cobden, a member of the Peace Society, he energetically denounced the policy of the Crimean war (1854). A severe illness compelled him to withdraw for a time to the Continent, and in his absence he was rejected by Manchester. Elected in 1857 for Birmingham, he seconded the motion against the second reading of the Conspiracy Bill, which led to the overthrow of Lord Palmerston's government. Mr Bright advocated the transference of India to the direct government of the crown, together with other reforms affecting our eastern dependency. When the civil war in America broke out, he warmly supported the cause of the North, although his own business and the whole of the Lancashire cotton-trade suffered severely in consequence. His name next became chiefly associated with the movement for reforming the electoral representation, which resulted in the Act of 1867. In 1868 he accepted office as President of the Board of Trade, but in 1870 was again obliged to retire in consequence of severe illness. His health having been restored, he took office in 1873, and again in 1881, as Chancellor of the Duchy of Lancaster; he was appointed Lord Rector of Glasgow University in November 1880. Mr Bright retired from the Gladstone ministry in 1882, being unable to support the government in its Egyptian policy. His appearances in public were afterwards infrequent; but in 1883 he defended himself in the House of Commons from a charge of breach of privilege in connection with speeches delivered at Birmingham. His completion of 25 years of service to this town was marked by a series of popular demonstrations there, in June 1883. In 1886-88 he opposed the Home Rule policy of Mr

Gladstone. He is recognised as one of the most eloquent public speakers of his time. A collection of his Speeches was published in 1868; a *Life* by Robertson (1877); his *Life and Speeches*, 2 vols., by G. Barnett Smith (1881); and his *Public Letters* (ed. by Leech, 1885). He died 27th March 1889.

Bright, RICHARD, physician, was born at Bristol, 28th September 1789, and studied at Edinburgh, Berlin, and Vienna, and from 1820 was connected with Guy's Hospital. He died 16th December 1858. He made many important medical observations (see BRIGHT'S DISEASE) and wrote numerous medical dissertations. His *Travels through Lower Hungary* (1818) contains a valuable account of the Gypsies.

Brighton, a parliamentary and municipal borough and fashionable watering-place in Sussex, 50½ miles S. of London by rail (1½ hour). Its former name, *Brighthelmstone* (1252-1810), was superseded about 1800 by *Brighton*, which occurs, however, as early as 1660, and also in 'The Girl I left behind Me' (1759). The town is built on a slope ascending eastward to a range of high chalk cliffs; to the west, these hills recede from the coast; and the nearest point of the South Downs is the Devil's Dyke, 5 miles distant. Ancient Brighthelmstone was a mere fishing-village on a level under the cliff. It suffered much at the hands of French, Flemings, and Spaniards, and still more from the sea, whose inroads in 1699, 1703, and 1706, undermined the cliffs and destroyed many houses. During excavations in 1818 the walls of some of the old streets were found under 15 feet of beach. Further inroads are prevented by a sea-wall of great strength (60 feet high and 23 feet thick at the base), extending along the east cliffs, and built between 1827 and 1838 at a cost of £100,000, the money being raised by the imposition of a duty on all coal entering the town. This duty was abolished in 1887, the whole of the debt having been paid off. The writings of Dr Richard Russell, a celebrated physician, first drew public attention about 1753 to Brighton as an eligible watering-place, and the discovery of a chalybeate spring in the vicinity increased its popularity. Dr Johnson in 1770 described the country as 'so desolate, that if one had a mind to hang one's self for desperation at being obliged to live there, it would be difficult to find a tree on which to fasten a rope.' Now the growth of trees is encouraged, and they have been freely planted both in and around the town. The visit of the Prince of Wales in 1782, and his subsequent yearly residence there, finally opened the eyes of the fashionable world to Brighton's immense attractions, and it thenceforth became the crowded resort of a health-seeking population, in which the opening of the Brighton Railway in 1841 greatly assisted. It was made a parliamentary borough in 1832, a municipal one in 1854; its progress has been very rapid, and the town is still steadily increasing. Brighton is for the most part extremely well built, as becomes a favoured retreat of wealth and aristocracy. It mostly consists of new and elegant streets, squares, and terraces. Kemp Town, as the east end of Brighton is locally known, has a famous crescent and square. The public hotels are magnificent; besides these there are the boarding-houses and nearly 1000 lodging-house keepers. A range of splendid houses fronts the sea for upwards of 3 miles, the promenade—asphalted from end to end, and exceptionally well lighted—being almost on a dead level, within a few feet of the sea, for the greater part of its length, but rising at the east end of the town to a height of 60 feet, on the top of the sea-wall already referred to. Beneath this is the Madeira Road, a fine drive and promenade a mile in length,

and sheltered effectually from the north wind. The population is greatly increased during the fashionable season by the influx of visitors, the average number being 30,000, chiefly from London, for which reason it is sometimes called London-super-Mare. There are more than twenty churches, that of St Nicholas, dating from the time of Henry VII., and restored in 1853, being the only ancient building, and more than fifty chapels. Holy Trinity Church has been rendered famous from the ministry of F. W. Robertson. The public buildings include the town-hall, the town-hall in the adjoining township of Hove (part of the parliamentary borough, but not included for municipal purposes), the unrivalled aquarium (1872), museum of British birds, school of science and art, Brighton college, theatre, Sussex county hospital, workhouse, blind asylum, various bathing establishments, and an abundant supply of good schools. At Queen's Park, in the east of the town, is the German Spa establishment, and at St Anne's well and wild gardens in the west is a chalybeate spring. In the north of the town is the Preston public park of 62 acres, which was opened in 1884, and cost £50,000, the money being left to the town by the 'leviathan' bookmaker, Mr W. E. Davies (1819-79).

Near the centre of the town is the Royal Pavilion or Marine Palace, a fantastic oriental or Chinese structure, with domes, minarets, and pinnacles, and Moorish stables, begun for the Prince of Wales in 1784, and finished in 1827. It was purchased in 1850 for £53,000 by the corporation, and with its fine pleasure-grounds it is devoted to the recreation of the inhabitants. The concert-hall known as the 'Dome,' formerly the royal stables, can accommodate 3000 people. Adjoining are the public library and museum and picture-gallery. The site of the Pavilion is in the Steyne Valley, which is practically in the centre of the Brighton sea-front, and the starting-point for the main road to London. There are three piers used as promenades—the Chain Pier (1823) on the east, opposite the Marine Parade (as the eastern part of the 3 or 4 miles of esplanade is called), 1136 feet in length; the much wider 'West Pier' (1866), 1115 feet long, which superseded the Chain Pier; and the New Pier, with the Marine Palace (1893), 1700 feet long. Numerous groynes to intercept the shingle constantly moving from west to east, and thus protect the promenade, intersect the beach from north to south. Most of these are of stout timber, but three are costly concrete structures, 12 or 15 feet wide at the top, with side-walls shoulder high, and these are favourite promenades. Brighton has no maritime trade, but there is some mackerel and herring fishing. The water-supply, which is in the hands of the corporation, and has cost £450,000, is derived from the chalk, and is practically inexhaustible. The several sources are all within two miles of the borough boundaries. An intercepting sewer many miles in length receives the sewage, which is discharged into the sea at Portobello, 4 miles beyond the eastern boundary of the borough. From its salubrity, the town abounds in boarding-schools; races are held on the Downs in August and November, and the volunteer reviews there have had a further tendency to attract visitors to Brighton. The 'Brighton reviews,' however, are now things of the past, marching columns having taken the place of the field-days with the movements of 20,000 volunteers hampered by much larger crowds of spectators. Pop. (1801) 7339; (1821) 24,429; (1841) 46,661; (1861) 77,693; (1881) 107,546; (1891) 115,873; of parliamentary borough (1891) 142,129. Brighton returns two members to parliament. See the works on Brighton by Erredge (1862), J. Bishop (1875-80), and Sawyer (1878).

Bright's Disease (of the kidneys), so called after Dr Richard Bright (q.v.), who first investigated its character. In 1827 he published a work in which he showed that dropsy is frequently associated with inflammatory changes in the kidneys, and an abnormal condition of the urine. When we apply heat or certain chemical reagents to the urine in such a case, it becomes opaque, showing that it contains *Albumen* (q.v.); and on examining the sediment under the microscope, we observe exuded lymph mixed with epithelium in the form of casts of the small ducts of the diseased organ. Further research has shown that these conditions of the urine occur in connection with several distinct affections of the kidney, varying much in duration, severity, and danger to life; and, while Bright's disease is retained as a generic term for the whole group, more precise names are applied to the several diseases included in it—e.g. acute inflammatory, cirrhotic, &c. Bright's disease, or nephritis. See KIDNEY (DISEASES OF).

Brigitta. See BRIDGET.

Brignoles, a town in the French department of Var, 42 miles ESE. of Aix by rail. A very salubrious place, it has a trade in wines, brandy, olives, and prunes. Pop. 4298.

Brihuega, a town of New Castile, Spain, on the Tajuña, 20 miles ENE. of Guadalajara. Pop. 4140. Here in 1710, during the War of the Succession, the English general Stanhope, owing to the dilatoriness of his allies in affording him support, was defeated by the Duke de Vendôme, and compelled to surrender, with all his force, amounting to about 5500 men.

Bril, the name of two landscape painters, both natives of Antwerp.—**MATTYS BRIL** (1550-84) went during his youth to Italy, and, under the patronage of Pope Gregory XIII., painted several frescoes in the Vatican. He was also distinguished as an historical and landscape painter.—His more celebrated younger brother, **PAUL BRIL** (1556-1626), received instruction under Mattys in Rome, and soon excelled his master. The works of his riper age exhibit high poetical qualities, and a fine appreciation of the effects of light in the sky, which have been described as but little inferior to those of his great successor, Claude Lorraine. They have a character of solemn rest and calmness, and at times even an elegiac tone of melancholy, which well accords with representations of the glories of fallen Rome.

Brill, a Dutch port. See BRIEL.

Brill (*Rhombus levis*), a common flat fish on British and other European coasts, belonging to the same genus as the Turbot (q.v.), from which it is distinguished by its being much less high in proportion to length, by the absence of bony tubercles, by the small, almost smooth scales, by the different curve of the lateral line, by the reddish-brown spots on the grayish brown of the 'upper' side, &c. It is seldom above 8 lb. in weight, is much eaten, but lacks the firmness and delicacy of turbot.

Brillat-Savarin, **ANTHELME**, French gastronomist, born at Belley, 1st April 1755, was a deputy in 1789, and mayor of Belley in 1793; he resided for a time in Switzerland, and afterwards in America, where he played in the orchestra of a theatre in New York; and from 1796 until his death, 2d February 1826, he was a member of the Court of Cassation. Shortly before this event, appeared his *Physiologie du Goût* (1825), an elegant and witty compendium of the art of dining, to which he brought the experience of half a century. It has been repeatedly republished and translated; the latest English form is *A Hand-*

book of Gastronomy, with 52 etchings by Lalauze (1884).

Brilliant is a popular name given to the diamond when cut in a particular way. See DIAMOND.

Brimstone ('a stone that burns; ' from Anglo-Saxon *byrnan*, 'to burn,' and 'stone') is the commercial name for Sulphur (q.v.) in sticks or rolls.

Brindāban, or **BINDRABAN**, a town of the North-west Provinces, on the right bank of the Jumna, 6 miles N. of Muttra. It is one of the holiest cities of the Hindus, and crowds of pilgrims come from all parts of India, more particularly in honour of Krishna; and through the munificence of wealthy devotees there are a large number of temples and shrines. Amongst the most notable temples are those of Golind Deva (1590), Madan Mohan, Gopinath (1580), and that of the Seths, erected between 1845 and 1851 at a cost of about £450,000. Here, as at Benares, the immediate margin of the river is occupied by flights of steps or ghauts. The inhabitants of Brindaban are almost exclusively Hindu. Pop. 31,611.

Brin'disi (the ancient *Brundisium* or *Brundisium*), a seaport town of Southern Italy, in the province of Lecce, is situated on a small promontory in a bay of the Adriatic Sea, 346 miles SE. of Ancona by rail. A place of very great antiquity, it was taken from the Sallentines by the Romans (267 B.C.), who some twenty years later established a colony here. It rapidly increased in wealth and importance, chiefly on account of its excellent port—consisting of an inner and outer harbour, the former perfectly landlocked, and capable of containing the largest fleets, and the latter also very well sheltered. Indeed, it soon became the principal naval station of the Romans in the Adriatic, and attained a population of 100,000. Horace has made a journey to Brundisium the subject of one of his satires (*Sat.* i. 5), and Virgil died here (19 B.C.) on his return from Greece. The city suffered greatly in the wars which followed the fall of the empire. When the Normans became possessed of it in the 11th century, the Crusaders made it their chief port for embarkation to the Holy Land; but with the decline of the crusades, the port again sank into insignificance. The city subsequently suffered greatly from wars and earthquakes. The principal buildings are the cathedral (1150), now in a somewhat ruinous state; and the castle, commenced by the Emperor Frederick II., and finished by Charles V. The neighbouring district is still remarkable for its fertility, olive-oil being produced in large quantities. Since the establishment of the Overland Route (q.v.) to India, Brindisi has greatly increased, and as the terminus of the Mont Cenis and other railway routes, it has become a great point of departure for passengers for the East. It is about 60 hours from London by rail; and the weekly steamers to Alexandria make the passage in three days. The extensive and well-sheltered harbour has undergone great improvement. Since 1866 two long quays have been made in the inner harbour, and a great breakwater and mole. Mail steamers can now lie alongside the quays in 26 feet of water. About 1000 vessels annually enter the port, of upwards of 600,000 tons burden. The city is the seat of an archbishopric. Pop. 14,508.

Brindley, **JAMES**, an eminent English mechanic and engineer, born in Thornsett, near Chapel-en-le-Firth, Derbyshire, in 1716. His parents being in poor circumstances, he received very little education; he was apprenticed at seventeen to a millwright, afterwards became an engineer, and in 1752 showed great ingenuity in contriving a water-engine for draining a coal-mine. A silk-mill on a new

plan, and several others of his works, recommended him to the Duke of Bridgewater (q.v.), who employed him to execute the canal between Worsley and Manchester. This difficult enterprise was crowned with success, including the remarkable aqueduct over the Irwell at Barton, 39 feet above the river, removed in 1888, to give place to a steel aqueduct in connection with the Manchester ship-canal. Thenceforth he devoted his great skill and genius to the construction of navigable canals; commenced the Grand Trunk, and completed the Birmingham, Chesterfield, and others. He appears to have constructed or laid out 365 miles of canals. Up till the last he remained illiterate, most of his problems were solved without writings or drawings, and when anything specially difficult had to be considered, he would go to bed and think it out there. Once, when under examination before a committee of the House of Commons, being jokingly asked for what purpose he supposed rivers to have been created, he is said to have replied: 'Undoubtedly to feed navigable canals.' His life was shortened by his excessive thought and labour, and he died at Turnhurst, Staffordshire, 30th September 1772.

Brine-shrimp (*Artemia*), a genus of small animals belonging to the Branchiopod (gill-footed) division of Crustacea. They have leaf-like swimming and respiratory appendages; the last eight rings bear no legs. They are hatched at the lowest level of crustacean life as Nauplii (q.v.). The

Fig. 1.—Side View of Male Brine-shrimp (*Artemia salina*), enlarged.

full-grown animal is about half an inch long, and having no shell, is transparent. The male has a strong embracing organ, the female a pouch-like brood-sac. The multiplication is very rapid. They swim actively and gracefully on their backs. There are five species of *Artemia*, all found in salt-lakes or in brine-pools where salt is manufactured. Of these species the most unlike are *A. salina* and *A. milhausenii*. Schmankewitsch has made the exceedingly interesting experiment of manufacturing one species of brine-shrimp into another. By increasing the salinity of the water, in the course of several generations, *A. salina* became *A. milhausenii*, and *vice versa*, by decreasing the salinity of the water in which the latter normally lives. Not only so, but by decreasing the salinity of the medium natural to *A. salina*, he was able to make it assume at least some of the characters of a quite different fresh-water genus—Branchipus. In the course of generations the *Artemia* acquired nine

Fig. 2.—Transformation of *A. salina* to *A. milhausenii*: 1, tail-lobe of *A. salina*, and its transition through 2-5 into 6, that of *A. milhausenii*. (After Schmankewitsch.)

instead of eight rings in the tail region, and a partial transformation was thus effected. This is one of the most striking instances of the effect of the environment on the organism (see ENVIRON-

MENT). In respect of habitat, the brine-shrimp is indeed remarkable, occurring, as it does, in myriads, in the concentrated brine of salt-pans. The workmen at salt-pans so confidently ascribe to it the rapid clearing of the brine in which it occurs, that when it does not appear in their *salterns*, they transport a few from other pools.

Brink, JAN TEN, a Dutch writer, born 15th June 1834, at Appingadam, studied theology at Utrecht, but early devoted himself to literary studies. After a short residence at Batavia, he returned in 1862 to teach Dutch at the Hague, and since that time has earned for himself a foremost place as a critic of acuteness and insight, especially in the department of fiction and belles-lettres. A popular novel of his own is *Het verloren Kind* (1879); and his *Causerien over Moderne Romans* (1885) is a valuable critique of modern novels.—BERNARD TEN BRINK, philologist, born at Amsterdam in 1841, from 1861 to 1865 studied philology at Münster and Bonn, and in 1870 became professor of Modern Languages and Literature at Marburg, in 1873 at Strasburg. Among his works are two books on Chaucer (1870 and 1884), a history of English literature (1874; Eng. trans. 1883), one on Beowulf (1882), and two volumes of literary remains. He died at Strasburg 29th January 1892.

Brinvilliers, MARIE MADELEINE, MARQUISE DE, poisoner, was the daughter of Dreux d'Aubray, lieutenant of Paris, and in 1651, while still young, was married to the Marquis de Brinvilliers. A gay and careless spendthrift, he allowed her to do very much as she pleased, and even introduced to her a handsome young officer, the Seigneur de Sainte Croix, who inspired her with a violent passion. Her father caused Sainte Croix to be arrested and imprisoned in the Bastille, where he learned from an Italian the properties of arsenic. On his release he imparted his fatal knowledge to his mistress, who, during his incarceration, had affected the greatest piety, spending most of her time in visiting the hospitals and in attending the sick. She now resolved to destroy her father, and, to test the efficacy of the poison, tried its effects on patients in the *Hôtel Dieu*. Having satisfied herself, she commenced operations on her parent, kissing and poisoning him continually for eight months, until her diabolical patience was exhausted, and she was at last induced to administer a very violent dose. He died, and no one suspected his daughter, who, aided by Sainte Croix and a domestic, Jean Amelin or Chaussée, next poisoned her two brothers and her sisters; her object being to find means of supporting her extravagant style of living with her paramour. She made several attempts to poison her husband; but Sainte Croix is said to have given him antidotes, dreading that he should be compelled to marry the widow. Sainte Croix died suddenly in 1672—his glass mask having fallen off while he was engaged in preparing a poison—and left documents inculcating the marchioness. She escaped to England, afterwards travelled into Germany, and next took refuge in a convent at Liège. From this, however, she was decoyed by an officer of justice disguised as an abbé, and conveyed to Paris. Among her papers was found a general confession of her crimes, whose truth she acknowledged after having been put to the torture, and on 16th July 1676 she was beheaded and burned at Paris (see CHAMBRE ARDENTE). Scribe made her the subject of a comic opera, and Albert Smith of a romance (1856). See also Banplein, *La Marquise de Brinvilliers* (1871).

Brioude, a town in the French department of Haute-Loire, 44 miles SSE. of Clermont by rail, with a Romanesque church of the 12th century. Pop. 4832.

Briquette is the name, originally French ('small brick'), given to a comparatively new form of fuel, made mostly from waste coal-dust, and used not merely for household purposes, but in various industries. A briquette is simply an admixture of coal-dust with pitch, moulded under pressure and heat, the pitch or some similar substance being introduced to form the cementing material. The size most generally adopted in Britain is about double that of the common building brick, and the weight about ten pounds. For household and domestic purposes, the smouldering qualities of the briquette give it especial value; it will remain alight for seven or eight hours, and can at any moment be roused by the poker into a cheerful flame. The heat given out is equal to that obtained from coal; and there is almost no smell in burning. Briquettes do not deteriorate by keeping. The coal-dust having been thoroughly cleaned by a stream of water from particles of clay, pyrites, shale, &c., is well dried in a cylindrical tube; it is then mixed with lumps of pitch in a disintegrator, which thoroughly combines the two ingredients, prior to their delivery into a vertical 'pug-mill.' Steam is now introduced into the pug-mill, rendering the pitch viscid and adhesive; the mixture, thoroughly amalgamated, then passes into moulds cut in a rotary die. Powerful rams, exerting a pressure of twenty pounds per square inch, force the material into each mould as it passes in rotation beneath. Nothing further remains but the delivery of each briquette after moulding on to a creeping band, where it is met and cooled by a current of air from a fan, and delivered into a wagon below. Some kinds of baking coal will form briquettes without cementing material; and various substances have been used as cement—tar, asphalt, grease, spoilt flour and starch, waste from soap and other manufactures, gypsum, &c. On the Continent, brown coal is most frequently used, but there are briquettes of charcoal and coke also. France is the original home of briquette-making, which first attained commercial importance in 1832. France still manufactures briquettes on a larger scale than any other country. The use of hard pitch as cementing material is due to an Englishman, Wylam, in 1842. Briquettes have been approved for heating the boilers of locomotives and marine engines, and in puddling and other furnaces, the chief hindrance in the way of their use being for a long time their cost. There are special works on the subject by Habets (Paris, 1870), Gurlt (Brunswick, 1880), Berg (Berlin, 1880), and Jünnemann (Vienna, 1881).

Brisbane, the capital of Queensland, a sea-port and chief seat of trade in the colony, is situated about 500 miles N. of Sydney, in Moreton district. It stands about 25 miles from the mouth of a river of its own name, which falls into Moreton Bay, and it is divided into the four divisions of North Brisbane, South Brisbane, Kangaroo Point, and Fortitude Valley. Pop. (1876) 26,911; (1881) 31,109; (1891) 48,738, or within a five-mile radius, 93,657. The Victoria lattice-girder bridge (1080 feet long), connecting North and South Brisbane, was destroyed by the disastrous flood of February 1893, which laid half of South Brisbane in ruins. Brisbane possesses broad and handsome streets, and some fine buildings, among the chief of which are the Houses of Legislature, which cost £100,000, the post-office, telegraph-office, the viceregal lodge, and the Queensland National Bank. The other buildings of importance are the new offices for the colonial secretary's department, town-hall, masonic hall, custom-house, Queensland club, school of arts, museum, central market, and schools, banks, railroad depôt, and insurance offices. It is the seat of an Anglican and of a Roman Catholic bishop.

There are some forty churches, the chief being the two cathedrals; and several daily and weekly newspapers are published. There are four parks and well laid-out botanic gardens. Brisbane is very well lighted, and part of the water-supply is drawn from the Enoggera watershed, about 7 miles distant. The export trade, which is large, includes gold, wool, cotton, sugar, tallow, and hides; and the imports, most of the articles in use among a thriving community. Regular steam communication is kept up with the other Australian ports, as well as with London (11,295 miles), and there is an extensive system of wharfs on both sides of the river. The channel of the river has been deepened, and admits of large vessels coming up to Brisbane. South Brisbane, on the south side of the Brisbane River, is a favourite place of residence, has good wharfs, and a spacious dry-dock, opened in 1881. Brisbane is the terminus of several local railways, and since 1888 it has had through railway connection with Sydney, Melbourne, and Adelaide—the last link to be made being the bridge over the Hawkesbury River. A transcontinental line from Brisbane to the Gulf of Carpentaria has also been surveyed. A movement has been set afoot for the establishment of a university here.

Brisbane was settled as a penal station in 1825 by Sir T. Brisbane (q.v.), governor of New South Wales, when a batch of desperate and incorrigible characters were landed at Eagle Farm, near the present town of Brisbane. At first they were employed in clearing the land, making roads, and building; and as might be expected, the early history of the colony was not entirely satisfactory. In 1836 the town comprised the houses of the commandant and other officers, barracks, a tread-mill, stores, &c. Three years later the convict settlement was broken up. The era of progress began in 1842, when the colony was opened to free settlers. At first an appanage of New South Wales, the Moreton Bay district was erected into an independent colony in 1859, when the city was incorporated, and the prosperity of the town and district became more steady and rapid. The climate on the whole is dry and healthy, with a high summer temperature, the mean temperature in the shade being 70° F. Race meetings are held at the Eagle Farm course in the neighbourhood.—The Brisbane River rises in the Burnett Range, and receives the Bremer and other rivers before its entrance into Moreton Bay, below the town of Brisbane.

Brisbane, GENERAL SIR THOMAS MACDOUGALL, soldier and astronomer, was born at Brisbane House, Largs, Ayrshire, July 23, 1773. At the age of sixteen he entered the army, and served with distinction in Flanders, the West Indies, Spain, and North America. In 1821, on Wellington's recommendation, he was appointed governor of New South Wales, a position he held for four years, during which time he introduced many wise reforms in penal treatment; promoted the cultivation of the sugar-cane, vine, tobacco, and cotton; and left at the close of his administration 50,000 acres of cleared land where he had found only 25,000. Emigration to this colony also began during his term of office; he found a colony of 23,000 and left 36,000. Under his auspices the river which bears his name, and on which stands the town of Brisbane (q.v.), was discovered. Brisbane holds a high place as a man of science. While in Australia, he catalogued no less than 7385 stars, for which work he received the Copley medal from the Royal Society. On his return to Scotland, he had an astronomical and a magnetic observatory established at his residence. He was president of the Royal Society of Edinburgh after Sir Walter

Scott. He was made a baronet in 1836, and a G.C.B. in 1837. He died January 27, 1860.

Brissot, JEAN PIERRE, one of the leaders of the French Revolution in its early stage, and afterwards numbered among its victims, was born at Chartres in 1754, and educated for the bar. After completing his studies at Paris, he went into the office of a procurator, but quickly abandoned the legal profession for the more congenial one of authorship. From his earliest years he had devoted himself with passionate eagerness to literary studies, especially history, economy, and politics. His first work, *Théorie des Lois Criminelles* (1780), gained the approbation of the best judges, and was followed by his *Bibliothèque des Lois Criminelles*, which established his reputation as a jurist. He was imprisoned in the Bastille on the false charge of having written a brochure against the queen; but after four months was liberated through the intervention of the Duke of Orleans. His love of freedom again involved him in danger, and to escape from a new term in the Bastille he retired to England. He afterwards visited North America as representative of the *Société des Amis des Noirs*. On the outbreak of the Revolution in 1789 he returned to France, and was elected by the citizens of Paris their representative in the National Assembly, where he exercised a predominant influence over all the early movements of the Revolution. He also established a journal called *Le Patriote Français*, which became the recognised organ of the earliest Republicans. As the Revolution proceeded, Brissot was recognised as the head of the party usually called Girondists (q.v.), from Gironde, the province to which most of them belonged, but also named Brissotins after their leader. Brissot contributed powerfully to the fall of the French monarchy, and strongly enjoined war against Austria and England, and the diffusion of republican principles throughout Europe. In the Convention, his moderation made him suspected as a friend of royalty, as he opposed the 'men of September' and the trial and condemnation of the king. When Louis XVI. heard his doom pronounced, he exclaimed: 'I believed that Brissot would have saved me!' But Brissot was weak enough to imagine that the best way to save the king would be to vote first for his death, and then appeal to the nation. Brissot and his party, perhaps the purest in principle and the weakest in action, ultimately fell before the fierce accusations of the Mountain or Jacobin party, which believed, or at least pretended to believe, that the virtuous Brissot had received money from the court to employ against the Revolution. With twenty other Girondists, Brissot was guillotined, October 31, 1793. See his *Memoirs (Legs à mes Enfants*, ed. by Lescure, 1885).

Bristles, the strong hairs growing on the back of the hog and wild-boar, and extensively used in the manufacture of brushes, and also by shoemakers and saddlers. They form an important article of British import, between two and three million pounds being annually imported, chiefly from Russia and Germany; but they are also obtained from France and Belgium, and large quantities of inferior quality have recently been received from China. From Russia, including Siberia, the average annual quantity of bristles imported into Britain is declining of late years. In 1886 it was nearly 907,000 lb., valued at £139,315. Russian bristles vary in value from £8 to £60 per cwt. Rather more bristles now come from Germany, but none of these are so valuable as the best qualities from Russia. They vary from £12 to £40 per cwt. From France fully 100,000 lb. are annually received, and smaller quantities are got from Denmark, Holland, and

Belgium. The supplies from the United States and East India have risen into importance within the last few years. The quality of bristles depends on the length, stiffness, colour, and straightness—white being the most valuable. The best bristles are produced by hogs that inhabit cold countries. The Russian hog is a long, spare animal, and the thinner the hog, the longer and stiffer the bristles. When it is sent to the south and fattened, the bristles become soft, and of course depreciated in value. In the summer the hogs are driven in herds through the forests, to feed on soft roots, &c., when they shed their bristles by rubbing themselves against the trees. The bristles are then collected, sewed up in horse or ox hides, and sent to fairs, whence they find their way, through agents, to all countries. The value of bristles has increased by one-half since 1858. See BRUSHES.

Bristol, a mercantile city 6 miles from the mouth of the Avon, and at its junction with the Frome, is locally partly in Gloucestershire and partly in Somerset, but since 1373 has been itself a county. The ancient town stood wholly on the north of the Avon, on a peninsula formed by that river and the Frome, which then flowed across the bottom of Corn Street; a new course was dug for the Frome in 1248, and this added a large area; and soon afterwards a stone bridge was built across the Avon, connecting the town with Temple-fee, and with Redcliff, which belonged to the lords of Berkeley. After a violent struggle with the House of Berkeley, these districts were included in the town and county by the charter of 1373. The castle, first built probably by Geoffrey, Bishop of Coutances, and rebuilt with a vast keep by Robert, Earl of Gloucester (died 1147), fell into decay, and was demolished in 1654; some remains may be seen in Castle and Tower streets. The cathedral was formerly a church of Augustinian canons (1148); the nave and aisles, pulled down for rebuilding in 15th century, were rebuilt in 1877; the choir is good 14th-century work; fine Norman chapter-house and gateway remain. Bristol, originally in the diocese of Worcester, was created a see and a city in 1540, with the abbey-church of St Augustine's as cathedral, and was united to the see of Gloucester in 1836; its re-erection as a separate see is now contemplated. Other noteworthy churches north of the old course of the Avon are St James' (Benedictine), with fine Norman work, and showing the division of the building into parochial and monastic churches; St Philip's and St Jacob's, St Stephen's, All Saints, and the Mayor's Chapel. South of the river is St Mary Redcliff, justly declared by Queen Elizabeth to be the 'fairest and most famous parish church in England.' Of the church rebuilt, 'from the cross aisles downwards,' by William Canynges, sen., merchant (*circa* 1376), only the south transept and south wall of nave remain; the rest was wrecked by the fall of the spire, and was built by Canynges' grandson and namesake (*circa* 1470); it is vaulted throughout, and is a magnificent specimen of Perpendicular architecture. The truncated spire was completed, 280 feet from ground, and 170 feet from top of tower, in 1872. In the muniment-room is the chest in which Chatterton (1752-70) pretended to have found the Rowley poems. The present Temple Church, on the site of an oval church of the Templars, was built in the 14th century; the tower leans about 5 feet, through a defect in the foundations; attached to the church is the Weavers' Chapel of St Katharine. Among the ancient houses of the town are Canynges' house, Redcliff Street, Spicer's (or Back) Hall, and St Peter's Hospital. The principal educational institutions are University College (1876), Clifton College (1862), and the grammar-school (1531); and the charitable foundations, Queen Elizabeth's

Hospital (1586), the Red Maids' School (1621), and Colston's School (1704), now removed to Stapleton, Gloucestershire. A technical school has lately been opened by the Merchant Venturers. The City Library (free) dates from 1613. Bristol first appears in history on a coin *circa* 1000. The town, which derived its early wealth from exporting slaves to Ireland, took a large part in the war of Stephen's reign, and was besieged by the king. The first charter was granted by Henry II., who also (1171) gave Dublin to the men of Bristol. By 1217 the town had a mayor. In the reign of Edward II. the burghers made an insurrection, stood a siege, and were not brought to obedience for nearly four years. The town did a large trade in wool, leather, wine, and salt, was famous for its cloths, and was one of the 'staple' towns (1353). In the next century its trade was in the hands of great merchants, many of them, like Canynges, men of princely liberality, and generally on the Yorkist side. Bristol took a prominent part in discovery and colonisation. In 1497 John Cabot sailed from the port, and was the first to discover North America; his son Sebastian declared that he was born in Bristol, and sailed thence on his voyage of 1498. Bristol men colonised Newfoundland, engaged in several early attempts to colonise Maine, and established a large trade with the

West Indies and American colonies. The city was taken by Prince Rupert in 1643, and by Fairfax in 1645. Colston the philanthropist (1636-1721) founded many charities, and his 'day' is annually kept in Bristol. In the 18th century privateering was largely carried on, and was encouraged by the success of Captain Woodes Rogers in 1708-10. Other famous names connected with Bristol and Clifton by birth and residence are those of Grocyn, Wraxall, Cottle, Sir T. Lawrence, T. L. Beddoes. Southey (1774-1843) was a native of Bristol, and he and Coleridge were much there in their younger days. Burke was returned for the city in 1774, and declined the poll in 1780. One of his chief supporters was Champion (1743-1791), maker of the famous Bristol china; true Bristol china is the product of 1773-81 only. The Reform riots of 1831 occasioned great loss of life and property. The first steam-ship for the transatlantic voyage, the *Great Western*, was built in the port in 1838. Strenuous efforts have been made to improve the dock accommodation; in 1809 the Avon for about 3 miles was turned into a floating harbour, and it has been proposed to extend the endockment of the river to its mouth, so as to make the town accessible to large ships. In 1883 the corporation purchased large docks at Avonmouth and Portishead. The principal imports are grain, provisions, oils, hides, tallow, sugar, and petroleum; the exports coal, salt, tin-plates, cotton piece-goods, chemical products, oils, and sundries. Vessels of about 1,500,000 tons enter the port annually. In 1885 the number of its members of parliament was raised from two to four. The town was made a county borough in 1888. A statue of Burke was unveiled in 1894. Pop. (1801) 61,153; (1841) 125,148; (1871) 182,552; (1881) 206,503; (1891) 221,578, and of parl. borough, 234,815. The Hotwell, noticed by the Bristol chronicler, William Worcester (died *circa* 1491), was a fashionable resort during the

later half of the 18th century (see *Humphry Clinker* and *Evelina*); it is now deserted and decayed. Clifton, however, the parish to which it belongs, has thriven. It is mentioned in Domesday, but has little history till it appears as a 'beautiful village' in 1760; it is now a large and handsome suburb of Bristol, of which it forms part for municipal and parliamentary purposes. It stands above St

The Church of St Mary Redcliff, Bristol.

Vincent's Rocks, which rise majestically from the Avon. The river is spanned 245 feet above high-water by a suspension bridge (1864, see BRIDGE). Clifton is well furnished with places of worship of different denominations, and has a zoological garden (1836), fine arts academy (1858), museum and library, and other public buildings. In the neighbourhood are the remains of some Roman camps.

See Barrett's *History and Antiquities of Bristol* (1789); Seyer's *Bristol Charters* (1812), and *Memoirs of Bristol* (2 vols. 1823); Nicholl's and Taylor's *Bristol, Past and Present* (3 vols. 1881); Hunt's *Bristol, Historic Towns Series* (1887); Latimer's *Annals of Bristol in Nineteenth Century* (1887).

Bristol. (1) a town of Bucks county, Pennsylvania, on the Delaware River, 20 miles NNE. of Philadelphia by rail or river. Here is the terminus of the Delaware Canal from Easton (Pa.), and a line of steamboats also connects the town with Philadelphia. It has a foundry, and manufactures of machinery, flour, felt, worsted, and furniture. Pop. 6553.—(2) A port of entry and capital of Bristol county, Rhode Island, on Narragansett Bay, 15 miles SSE. of Providence by rail, with shipbuilding and sugar-refining, and manufactures of cotton and rubber goods. Pop. 5463.

Bristol Bay, an arm of Behring Sea, lying immediately to the north of the peninsula of Alaska, receives the waters of two large lakes, by which communication with the interior is opened up for a considerable distance.

Bristol Channel, an inlet of the Atlantic Ocean, in the south-west of England, between South Wales on the north, and Devon and Somerset shires on the south; or it may be regarded as an extension of the estuary of the river Severn. It is about 80 miles long, and 5 to 43 miles broad; the depth ranging from 5 to 40 fathoms. It is the largest inlet or estuary in Britain, having a very irregular coast-line of 220 miles. The chief rivers

which flow into it are the Towy, Taf, Usk, Wye, Severn, Avon, Axe, Parret, Taw, and Torridge. The tides in it rise to an extraordinary height—at Bristol, 35 feet; at King's Road, 40; and at Chepstow, once at least, 47. The rapid flow of the tides meeting the currents of the river produces, in the narrow parts of the channel, and in the mouths of one or two of the rivers which enter it, the phenomenon of the *Bore* (q.v.), the tide advancing like a wall of water sometimes 6 to 9 feet high. The chief bays and harbours are Caermarthen and Swansea Bays, Cardiff Roads, on the north, and Bideford or Barnstaple, Ilfracombe, Minehead, Porlock, and Bridgwater, on the south.

Brisure, in Heraldry, is a variation on the original arms of a family, introduced to distinguish cadets from the head of the family and from each other. See CADENCY, HERALDRY.

Britain. See GREAT BRITAIN, NEW BRITAIN.

Britannia, the name applied by Cæsar and other Roman writers to the island of Great Britain; Aristotle having referred to the *Nēsoi Bretannikai* ('British isles') as early as the 4th century B.C. According to Rhys, *Britannia* has nothing to do with the Welsh *brith*, 'spotted, tattooed,' from which it is commonly derived; but 'so far as we know, the only Celtic words which can be of the same origin are the Welsh vocables *brethyn*, "cloth," and its congeners;' in which case the Britons may have styled themselves 'cloth-clad' in contradistinction to the skin-wearing neolithic nation that preceded them (see CELTS). Though the Romans kept possession of Britain for nearly four centuries (43–410 A.D.), their occupation of it remained essentially military, and consequently the influence of their civilisation was to a great extent restricted to the towns. The general tendency of their government was to break up the native tribal system, and substitute their own in its stead, but in this they did not succeed so completely as in Gaul and Spain, neither did the Latin language displace the native British, as it did in these countries. The country south of the Solway Firth and the mouth of the Tyne, in the reign of Claudius, formed one Roman province under a consular legatus and a procurator. Ptolemy mentions seventeen native tribes as inhabiting this tract. Severus (210 A.D.) divided it into two parts, Britannia Inferior, the southern, and Britannia Superior, the northern, placing these under separate prefects. In the division of the empire under Diocletian, Britain was made a diocese in the prefecture of Gaul, and was governed by a vicarius residing at Eboracum (York). It was divided into five provinces, of which the boundaries, though uncertain, are supposed to have been as follows: Britannia Prima, England south of the Thames and the Bristol Channel; Britannia Secunda, Wales; Flavia Cæsariensis, the country between the Thames, Severn, Mersey, and Humber; Maxima Cæsariensis, the rest of England to the Wall of Hadrian; and Valentia—soon abandoned by the Romans—or Scotland south of the Wall of Antoninus. The population of Roman Britain was in the main Celtic, divided, as at present, into two branches, the Cymric and Gadhelic. The former occupied the south and east, the latter the north and west. Besides these, there probably existed remnants of two earlier races which were ultimately absorbed, a small dark-haired race possibly akin to the Basques (q.v., hence sometimes called *Euskarian*), and a tall fair-haired race supposed to be of Finnish descent. The traces of the dark stock are most marked in South-west England, South Wales, and parts of the Scottish Highlands. To insure the obedience of the natives, at least three Roman legions—chiefly composed of Gauls,

Germans, Iberians, and but few pure Romans—were stationed in Britain—viz. at Eboracum, Deva (Chester), and Isca (Caerleon) in South Wales. Under the Romans, many towns (*coloniæ* and *municipia*)—fifty-six are enumerated by Ptolemy—arose in Britain, and formed centres of Roman law and civilisation. The towns of Eboracum (York) and Verulamium (near St Albans) had the privileges of Roman citizenship. The Romans made many roads or streets (*strata*), of which there are still numerous remains, across the country, all centring in London. They also developed it into a corn-growing country. Druidism was the religion of the Britons at their conquest by the Romans, but the latter introduced Christianity and Roman literature into the country, though Christianity was not recognised as the state religion till 324 A.D. There are many remains still extant of the presence of the Romans in Britain, such as camps, roads, ruins of houses, baths, flues, altars, mosaic pavements, painted walls, metallic implements and ornaments, weapons, tools, utensils, pottery, coins, sculptures, bronzes, inscriptions, &c. These remains show that the Romans wished to render their British conquests permanent, and that they had greatly improved the arts of the ancient Britons, as is evident on comparing the remains with the far ruder native antiquities of the British pre-Roman or prehistoric era, such as tumuli, barrows, earthworks, so-called Druidical monoliths and circles, cromlechs, cairns, pottery, weapons, tools, utensils, ornaments, &c. Many of the Roman remains in Britain also show that the Romans had introduced into the country the refinements and luxuries of Rome itself. See ENGLAND, ROADS, WATLING STREET; Elton's *Origins of English History* (1882), and Scarth's *Roman Britain* (1883).

Britannia Metal. The composition of Britannia metal varies. Much of it is 90 tin, 8 antimony, and 2 copper. Another formula is 81 tin, 16 antimony, 1 copper, and 2 zinc. But most of the alloys passing under this name have between 80 and 90 per cent. of tin with varying proportions of antimony and copper. The manufacture was begun at Sheffield by Hancock and Jessop in 1770; it reached Birmingham towards the close of the century, and made gradual progress. At first, the articles were made by stamping with dies, and soldering up into form; this, being a slow operation, rendered the articles expensive. Afterwards, the curious process of *metal-spinning* was introduced; and this, with the subsidiary operation of swaging, rendered a great reduction in price possible. In the spinning process, a thin sheet or piece of Britannia metal is placed upon a wooden model shaped like the article to be made; the model is made to rotate in a lathe; and steel, hardwood, bloodstone, or other tools are employed to press the yielding metal into all the curvatures of the model. Ductility is an essential quality to the attainment of this end with the metal; how complete it is, may be seen in such articles as Britannia metal teapots and dish-covers, the principal forms of which are not given by hammering, stamping, or casting, but by spinning. Besides spinning and swaging, the processes include stamping, soldering, casting, and polishing. Britannia metal forms a good ground or basis for electroplating with silver. Britannia metal spoons and ladles, made by casting, stamping, and burnishing, have been nearly driven out of the market by German silver; but the former metal is more largely used than ever for hot-water jugs, coffee-pots, sugar-basins, soup tureens, gravy-dishes, vegetable and side dishes, dram bottles, drinking-cups, wine-coolers, soap-boxes, liquor-frames, cruet, waiters, trays, &c.; and as a basis for electroplate. Sheffield and Birmingham are

the chief seats of the manufacture. After electroplating came into general use in the decade 1840-50, the trade in Britannia metal wares became double what it was previously.

Britannia Tubular Bridge. See BRIDGE.

Britannicus, or in full, Claudius Tiberius Britannicus Caesar, was the son of the Emperor Claudius (q.v.) and his wife Messalina, and was born 42 A.D. The second wife of Claudius, Agrippina, caused her husband to adopt her son Nero, and treat Britannicus as an imbecile; and Nero, after his accession to the throne, caused his miserable half-brother to be poisoned in 55.

British Association, an association whose object is, by bringing together men eminent in all the several departments of science, to assist the progress of discovery, and to diffuse over the whole country the latest results of scientific research. A prevailing impression that England had fallen behind other countries, both as to the general estimation in which scientific men were held, and the prosecution of science itself, led to its formation. It was thought that an imposing union of men of science with the nobility, gentry, and clergy might tend to revive the philosophic spirit of the country. Such meetings had already taken place in Germany, and probably suggested the idea of this institution. Many leading men of the age took part in its formation, but the honour of being its founder must be ascribed to Sir David Brewster. By his exertions the first meeting of those who were favourable to the design was held at York in the year 1831. At this meeting the constitution of the society was determined, the several sections had their provinces assigned to them, and subjects were proposed on which reports were to be drawn up and read at the ensuing meeting. This took place at Oxford in 1832. The university had cordially welcomed the new association, the papers read gave it a high character, and from this date it may be said to have been in complete and successful operation. The several sections of the society, each of which has its own committee and president, now are: Section A, Mathematical and Physical Sciences; B, Chemical Science; C, Geology; D, Biology (Zoology, Botany, &c.); E, Geography; F, Economic Science and Statistics; G, Mechanical Science; H, Anthropology; I, Physiology (a separate department only since 1894). Many of the successive presidents have been men of great political and social as well as scientific eminence.

At the close of each meeting, the town at which the meeting shall be held is determined two years in advance, and a president appointed. In 1884 the place of meeting, contrary to the usual practice, was at Montreal in Canada. The subscriptions of a continually increasing membership have placed a large fund at the society's disposal, which has been expended in the prosecution of science. In many cases, as in long astronomical calculations or extensive meteorological observations, the labour of subordinates is required, and certain apparatus, and it is in defraying such expenses that the funds of the British Association are very wisely employed.

The annual meeting takes place about the end of August and lasts more than a week, excursions and social gatherings diversifying the more serious labours of the association. The attendance varies considerably, having been 3335 at Newcastle in 1863, only 915 at Swansea in 1880, and 2533 at the jubilee gathering at York in 1881. The meeting at Manchester in 1887 was attended by 3838 persons. The income fluctuates considerably, having in recent years varied from £2200 to over £4000 (£4336 in 1887), and the annual grants for the promotion of science are usually between £1000 and

£2000 in amount. The sums given range from £5 to £100 to private persons and institutions, for the promotion of science and publication of results of original observations. A volume is published annually containing reports on the progress of science, addresses delivered, papers and abstracts of papers read at the meetings, and copies are presented to societies and libraries at home, in the colonies and abroad. There are similar American, French (1872), and German Associations for the advancement of science.

British Columbia, &c. See COLUMBIA, GUIANA, HONDURAS, &c. For British South, Central, and East Africa, see NYASSALAND, MATABELELAND, ZAMBESIA, &c.; and for the British Empire, see GREAT BRITAIN.

British Gum. See DEXTRIN.

British Museum. The British Museum, an important national institution in London, originated in a bequest of Sir Hans Sloane, in accordance with which his extensive collection of objects of natural history, works of art, books and manuscripts, was offered in 1753 to the government, for the sum of £20,000, or two-fifths of its original cost. The offer was accepted; the necessary funds were raised by a lottery; and the collection, along with the Harleian and Cottonian Libraries, was arranged in Montague House, which had been purchased for £10,250. The new institution, thenceforth called the BRITISH MUSEUM, was opened in 1759. The presentation by George III. of a collection of Egyptian antiquities in 1801, the purchase of the Townley Marbles in 1805, and of the Elgin in 1816, necessitated the erection of a new wing. Soon afterwards the old house was condemned, and plans were prepared by Sir R. Smirke for new buildings; but none were undertaken till 1823, when the eastern wing of the present building was erected for the reception of the library of George III., which had been presented to the museum by George IV. The building, a hollow square in the Ionic order of architecture, was not completed till 1847. Its principal front is towards the south, facing Great Russell Street, and presenting an imposing columnar façade, 370 feet in length. On each side of the museum there is a semi-detached house, containing the residences of the chief officers of the establishment.

Scarcely had Smirke's plans been carried out, when it was found that the increase of the library, both in books and readers, made fresh building imperative. A plan devised by Mr (afterwards Sir Antonio) Panizzi, the keeper of the department of printed books, was accepted. Parliament voted the first grant for it in 1854, and it was executed in three years, at a total cost of £150,000. The new building was erected in the interior quadrangle, which it almost completely occupies. The reading-room is circular and contains ample and comfortable accommodation for over 300 readers. It is constructed principally of iron, with brick arches between the main ribs. The dome is 106 feet in height, and its diameter 140 feet, being second only to the Pantheon of Rome, and that but by 2½ feet. Equally remarkable has been the saving of space in the fitting up of the library. The shelves are formed of galvanised iron plates, edged with wainscot and covered with leather, and are supported on malleable-iron standards. With the exception of those placed against the external walls, the bookcases are all double, a lattice of ironwork being fixed for the longitudinal separation of the books. Thus, throughout the whole interior of the new building, walls are dispensed with, the divisions being in all cases formed of the double ranges of books. The building contains 3 miles lineal of

bookcases 8 feet high. Assuming them all to be spaced for the average octavo book size, the entire ranges form 25 miles of book-shelves, and would accommodate 1,000,000 such volumes. In addition to this, the dome-room, which is the reading-room, has accommodation for 60,000 volumes.

With the rapid increase of the collections, both by donation and purchase, the need of space was soon again felt, and the trustees resolved to erect a building to be devoted entirely to Natural History—that is to say, to the departments of Botany, Zoology, Geology, and Mineralogy—on the site occupied by the International Exhibition of 1862. Parliament voted in the year 1873, £80,000 for this purpose, and the new rooms began to be occupied in 1881. The whole cost of the new museum very nearly reached the sum of £400,000. This elegant terra-cotta edifice, which is situated at Kensington in the Cromwell Road, was designed by Mr Alfred Waterhouse. Its galleries are finely proportioned and well lighted, and the entrance-hall is one of the finest of modern erections. In 1879 the reversion of a bequest of about £65,000, left more than half a century earlier, by Mr William White, enabled further important additions to be made to the building at Bloomsbury. On the west side has been erected a new gallery, measuring 153 feet by 40, for the exhibition of Greek sculpture; on the east, on ground formerly occupied by the principal librarian's garden, are buildings containing a complete set of rooms for the department of prints, and new accommodation for readers of manuscripts and newspapers, which were opened to the public in 1888.

Contents.—At first the contents of the museum were arranged under three departments—Printed Books, Manuscripts, and Objects of Natural History. From time to time the number of the departments has been increased, so that, instead of three, there are now eleven—viz. Printed Books (with the sub-department of Maps), Manuscripts, Prints and Drawings, Oriental Antiquities, Greek and Roman Antiquities, Coins and Medals, British and Medieval Antiquities and Ethnography, Zoology, Botany, Geology, and Mineralogy. In noticing the contents of the museum, we shall refer to them in this order.

Printed Books.—This is the largest department in the museum. It occupies the whole of the ground floor on the north and east sides, the new building erected in the quadrangle, and a considerable portion of the basement of the museum.

The original bequest of Sir Hans Sloane consisted of 50,000 volumes. In 1757 George II. presented the library of printed books which had been collected by the kings of England since Henry VII., and which included the libraries of Cranmer and Casaubon. He also annexed the important privilege, which the Royal Library acquired in the reign of Queen Anne, of being supplied with a copy of every publication entered at Stationers' Hall. Among subsequent additions to the library may be mentioned the voluminous collection of pamphlets, &c. relating to the civil wars of England between 1640 and 1660, presented by George III.; the musical libraries of Sir J. Hawkins and Dr C. Burney; Garrick's collection of old English plays; Dr Bentley's collection of the classics, annotated by his own hand; the Rev. C. M. Cracherode's library of about 4500 volumes, remarkable for their beauty and excellence of condition; Sir J. Banks's valuable and extensive collection on natural history; and a large mass of tracts and pamphlets relating to the French Revolution, purchased from J. Wilson Croker, and of very great value. The most important addition was made in 1823, when George IV. presented the splendid library that had been collected by his father during his long reign, at an expense of little less than £200,000. The mag-

nificent library of the Right Honourable Thomas Grenville was bequeathed to the museum in 1846. It consists of 20,240 volumes, which cost upwards of £54,000. In the same year was obtained also the extensive collection of Chinese works, amounting to 11,509 volumes, which belonged to Robert Morrison. By purchases, bequests, and donations, the library has become one of the first in the world, containing now about 1,500,000 printed volumes. See LIBRARIES. During the year 1886, there were added 33,844 volumes, including music and volumes of newspapers. In 1892, exclusive of 170,618 newspapers, 41,097 distinct works were added to the National Library, 12,715 being purchased, 15,761 acquired under the Copyright Act, and 12,131 presented.

A catalogue of the printed books, in seven octavo volumes, was published in 1813-19. So great have been the additions to the collection, that in 1880 the general MS. catalogue occupied upwards of 2000 volumes folio. The adoption in that year of the plan of printing the title-slips, has checked this rapid rate of growth, and a printed catalogue is now in progress. At the end of 1887, 169 printed volumes had taken the place of 633 in manuscript, and it is calculated that the beginning of the 20th century will see the whole of the catalogue represented by some 600 printed volumes. The adoption of printing has also facilitated the commencement of a subject-catalogue of all new acquisitions, and the first instalment of this was issued in 1886. Another important catalogue issued by this department is that of old English books published previously to 1641, a work of the highest bibliographical importance.

The right of access to the library is easily obtained. Any person desiring it is 'to apply in writing, addressed "To the Principal Librarian of the British Museum," specifying his description and place of abode, and accompanying his letter with a written recommendation.' Since the adoption (1880) of electric light in the reading-room, the number of readers has greatly increased, and in 1893 they reached the total (not so large as in 1892) of 194,102. The number of books consulted by these readers was 1,402,875.

Maps.—There are over 50,000 published and 20,000 manuscript maps in the museum. A catalogue of these in two large quarto volumes has been published.

Manuscripts.—The manuscripts are contained in several rooms in the south-east angle of the building. The collection consists of: (1) The Sloane manuscripts, relating chiefly to medical and natural history subjects. (2) The Cotton manuscripts, rich in documents referring to the history of Britain, including two of the originals of *Magna Charta*, in registers of English monasteries, and in original letters of royal and illustrious personages. This collection contains the *Durham Book*—a copy of the Latin Gospels, with an interlineary Saxon gloss, finished in the year 720. (3) The Harleian manuscripts, a collection rich in illuminated MSS., in ancient, civil, and ecclesiastical records, in manuscripts of the classics, among which is one of the earliest known copies of the *Odyssey*, and in early English poetry. (4) The manuscripts of the Ancient Royal Library. These were collected by our kings, from Richard II. to George II.; many of them were obtained from the monasteries at the dissolution. Amongst the most valuable treasures here are the *Codex Alexandrinus*, a manuscript of the Bible written in uncial Greek, before the close of the 5th century, and the *Basilicon Doron* of James I., in his own handwriting. (5) The Lansdowne manuscripts. This collection comprises the Burghley and Caesar papers, the manuscripts of Bishop Kennett, and

numerous valuable historical documents and state papers. (6) The Hargrave manuscripts, almost exclusively connected with law. (7) The Burney manuscripts, containing a large collection of the Greek and Latin classics. Among them is a copy of the *Iliad*, answering that of the *Odyssey* in the Harleian collection. (8) The Howard-Arundel manuscripts, obtained from the Royal Society. This collection is singularly rich in materials for the history of our own country and language. (9) The Oriental manuscripts, a collection composed of several purchases and bequests. It includes the manuscripts acquired by Mr Rich while consul at Bagdad, and consists of numerous Syriac, Arabic, Ethiopic, and other oriental codices. A large series of Ethiopic manuscripts was obtained at Magdala on the occasion of the Abyssinian war. (10) Additional manuscripts. This collection consists of innumerable bequests, donations, and purchases, which from the establishment of the museum have been and are still being acquired. Catalogues of the complete collections have long been in existence, while that of the additional manuscripts is continually being increased by fresh volumes. Separate catalogues have also been issued of the collections of Greek and Latin, and also of Persian manuscripts, and a valuable catalogue of romances is in progress. The most important recent additions to the department have been the purchase of the Stowe manuscripts from Lord Ashburnham, and the gift by the Earl of Chichester of the Duke of Newcastle's papers in 430 volumes. In 1887 the department contained upwards of 50,000 volumes, 47,000 charters and rolls, nearly 10,000 detached seals and casts of seals, and upwards of 100 ancient Greek, Coptic, and Latin papyri.

Prints and Drawings.—The collections of this department are kept in rooms in the new buildings erected from the bequest of Mr William White. They consist of prints and drawings bequeathed to the museum in 1799 by the Rev. C. M. Cracherode; of those bequeathed in 1824 by Mr Payne Knight; and of numerous smaller bequests and donations. No purchases were made for this department until about 1840, when a sum was first included in the estimates for this purpose. The collection now contains examples in all English and foreign schools of original drawings, etchings, and engravings, also of prints from pictures by well-known masters. It is peculiarly rich in early Italian and early German, and Dutch and Flemish engravings. Among the drawings are fine examples of Raphael, Michael Angelo, Leonardo da Vinci, Albert Dürer, and Claude; among the water-colours, of David Cox, Girtin, and W. Müller. The collections of etchings by Rembrandt and of engravings by Hogarth are alike unrivalled. There is also an extensive collection of English and foreign portraits and of satirical prints. A large number of Japanese drawings and paintings have recently been acquired, and of these a catalogue was issued in 1887.

Oriental Antiquities.—The Egyptian monuments in this department date from a period as remote as 2000 years before the Christian era, and come down to the Mohammedan invasion of Egypt (640 A.D.). The collection comprises the antiquities which fell into the hands of the British army at the capitulation of Alexandria; presents from General Vyse, the Duke of Northumberland, &c. The sculptures are formed of granite and basalt; they represent human and allegorical figures, sometimes of colossal size. There are several beautifully sculptured sarcophagi. The key to the Hieroglyphics (q.v.) was furnished by the celebrated Rosetta Stone (q.v.), which is placed in the centre of the gallery. The smaller Egyptian remains are exhibited in a gallery on the upper floor; they

consist of objects relating to religion, as representations of divinities and sacred animals in wood, metal, stone, and porcelain; of objects relating to civil and domestic life, as dress, personal ornaments, household furniture, artistic and writing implements, armour, and weapons of war, &c.; and of objects relating to death and burial, as mummies and coffins, with the scarabæi, amulets, and other ornaments found with them.

The Assyrian antiquities are contained in a suite of rooms erected on the outside of the Egyptian Gallery, and in a spacious room on the basement. The collection consists of sculptures excavated at Nimrud, Khorsabad, and Koyunjik by Layard in 1847-50, and more recently by Rassam and Loftus, under the direction of Sir H. C. Rawlinson. The Nimrud sculptures are the oldest, belonging to a period ranging from 930 to 747 B.C. Those obtained from Khorsabad seem to have been executed under a monarch who reigned about 747-721 B.C., while the collection from Koyunjik belong to the time of Sardanapalus, apparently 721-625 B.C. The monuments consist chiefly of slabs of gypsum, alabaster, and limestone sculptured in low relief, the subjects being the exploits of the king whose palace walls they ornamented.

Greek and Roman Antiquities.—This collection occupies a series of rooms extending from the reading-room to the north-west angle of the museum. The Lycian Gallery contains a series of architectural and sculptural remains from ancient cities in Lycia, obtained by Sir C. Fellows in 1842-46. The Elgin Gallery contains the sculptures from Athens and Attica, the greater portion of which were obtained by the Earl of Elgin, and purchased from him by parliament in 1816 for £35,000. The most important series in the gallery is the decorations of the Parthenon (q.v.), which, notwithstanding their dilapidated condition, form the most valuable monument of Greek art which has descended to modern times. The gallery contains also sculptures and casts from the Temple of Wingless Victory, the Temple of Thesus, and the Erechtheum, at Athens. The Hellenic Gallery contains a number of antiquities brought from Greece and its colonies at different times. The most important are twenty-three slabs of a frieze sculptured in mezzo-relievo, which, from the locality where they were found, are called the 'Phigalian Marbles.' In a new gallery, built out of the White bequest, are the remains of the famous Mausoleum (q.v.) at Halicarnassus, erected in honour of Mausolus by his widow Artemisia. These remains were discovered by C. T. Newton, Esq., in 1857-59.

The gallery on the south side of the building is occupied with the Roman and Græco-Roman sculptures. The bulk of the collection was formed by Charles Townley, Esq., and purchased in 1805 for £20,000. It contains an interesting series of Roman portrait sculptures, and a very extensive mythological series, amongst which are some of universal fame—the Venus, Clytie, the Discobolus, and many others. A room on the basement is appropriated to mosaics and miscellaneous monuments, such as representations of animals, architectural and decorative fragments, and sacred and domestic implements. A fine collection from Southern Italy, exhibiting specimens of the arts of the Etruscans, Greeks, and Romans, was bequeathed to the museum by Sir William Temple in 1856. The former reading-room of the department of prints in the north-west angle is now occupied by a collection of Greek and Roman sepulchral monuments.

The collections of smaller remains are placed in a suite of rooms on the upper floor. They consist of (1) An extensive series of vases, commonly, though not correctly known as Etruscan, formed from the

collections of Sir W. Hamilton, &c., and from excavations in Sicily, Rhodes, and on the sites of Greek colonies in Cyrene and elsewhere. (2) A miscellaneous collection of terra-cottas, mural paintings, and other objects. (3) Bronzes of Greek, Etruscan, and Roman workmanship, consisting of sculptures, and various domestic and other articles, as candelabra, lamps, vases, horse-trappings, armour, &c. (4) The collection of engraved gems and gold ornaments, now, since the addition of the Blacas and Castellani collections, perhaps the richest in the world.

Coins and Medals.—The very large collection of these objects is arranged in chronological order under five great divisions—viz.: Greek, Roman, Medieval and Modern, English, and Oriental.

British and Medieval Antiquities and Ethnography.—The British collection is arranged in chronological order. The oldest series contains the antiquities of the Stone and Bronze periods, consisting of celts, daggers, swords, shields, and early pottery. The British-Roman antiquities comprise specimens of earthenware, lamps, and miscellaneous articles. A small collection of sepulchral urns, weapons, and personal ornaments represents the Anglo-Saxon period. The Ethnographical collection contains antiquities as well as objects of modern use. In 1855 Mr Henry Christy bequeathed to the museum his extensive collections of antiquities and ethnography, and these are now exhibited in the former 'Bird Gallery.' Another valuable bequest is the Slade collection, illustrating the history of glass in all its branches. But the department has had no more generous donor than its present keeper, Mr A. W. Franks, whose numerous gifts to it cannot be valued at less than £20,000.

Natural History Museum at South Kensington.—In 1856 the trustees united the Natural History departments under Professor Owen, who was then appointed superintendent of Natural History. In the spring of 1881 the new building erected at South Kensington, for the reception of the zoological, mineralogical, geological, and botanical departments, was opened to the public. The following departments, therefore, though belonging to the British Museum, now form the Natural History Museum at Cromwell Road, South Kensington.

Zoological Department.—This department contains a collection of animals arranged in systematic order in the galleries, comprising stuffed mammals, birds, reptiles, and fishes, and the hard portions of radiate, molluscan, and articulate animals. A room is specially devoted to the fauna of Britain. In rooms on the ground and basement floors are arranged the collections of insects, of osteology, and of specimens preserved in spirits. In 1873 the unique and extensive collection of birds formed in the Eastern Archipelago by Wallace, was acquired by purchase. Recent additions are the magnificent Gould collection of humming-birds, and the Walsingham collection of birds and birds' nests.

Botanical Department.—The herbarium of Sir H. Shoane, the nucleus of this collection, consisted of about 8000 species, bound in 262 volumes. In 1820 the magnificent herbarium of Sir Joseph Banks was bequeathed to the museum, and under the superintendence of Robert Brown, was transferred to two rooms prepared for it in the south-east angle of the building. The collection has since been rapidly increasing: during the year 1880 about 9000 species of plants were added; and in 1873 William Wilson's herbarium of British and foreign mosses was acquired by purchase. The collection contains an extraordinary number of typical specimens—the identical plants from which the original descriptions were taken by Linnaeus, Aublet, Jacquin, Brown, Benthams, Ben-

nett, and others. The exhibition rooms contain a series of specimens illustrating the most striking characteristics of the great divisions of the vegetable kingdom, arranged in order; and a series of fossil plants, the value of which is increased by the transparent sections showing their structure, which are placed beside them.

Geological Department.—This collection occupies the wall-cases of the principal gallery on the north side of the museum. It contains an extensive series of the fossil remains of plants and animals from the various fossiliferous strata; it is especially rich in the fossils of the secondary formations. Amongst its more valuable contents may be mentioned the collections of Dr Mantell, the Tertiary fossils collected by Dr Falconer in India, and the remarkable fossil birds from New Zealand.

Mineralogical Department.—The minerals are contained in the table-cases in the Geological Gallery. They are arranged according to a chemical classification. Many valuable and unique specimens exist in the collection, which is rapidly increasing.

The expenses of the museum are paid by grants of public money. The sum provided by the estimates in some years considerably exceeds £150,000.

While the usefulness of the museum must always be gauged by the help it renders to real students, much of late years has been done to increase its popularity with casual visitors. To every article exhibited is attached a label, giving its name, and where needful, something of its history. In departments, the bulk of whose treasures cannot be displayed, selections are placed in show-cases, among the most interesting of which are those containing autographs of celebrated personages; ancient, oriental, and illuminated manuscripts, books illustrating the history of printing in various countries, rare bindings, &c. By the Department of Prints a permanent exhibition is given of works illustrating the history of etching and engraving, and arrangements have been made for temporary exhibitions of rarities. During the last few years also exhibitions have been given in the King's Library in connection with the centenaries of Luther, Wyclif, &c. The number of visitors to the museum in 1892 (the largest since 1885, 1893 showing a small falling off) amounted to 558,548 to the parent institution, and some 400,000 to the museum of Natural History.

Briton Ferry, a seaport of South Wales, in Glamorganshire, at the mouth of the river Neath, $2\frac{1}{2}$ miles from the busy town of Neath, to which it serves as a port. Pop. of parish, 6061.

Brittany (Fr. *Bretagne*), the great north-western peninsula of France, extending in triangular form into the sea, its base resting on Normandy, Maine, Anjou, and Poitou, its sides washed by the Channel and the Atlantic Ocean. In earlier times it formed, with the name of duchy, one of the provinces of France; now it forms the five departments of Finistère, Côtes-du-Nord, Morbihan, Ille-et-Vilaine, and Loire-Inférieure, with a total area of 13,130 sq. m., and a population (1891) of 3,162,272. Before the Revolution, this district fell into the nine dioceses of Rennes, Dol, Nantes, St Malo, and St Briens, Tréguier, Vannes, Quimper, and St Pol-de-Léon; of which the first five made up the two popular divisions, the names of which are still indeed in general use: Upper Brittany (*Haute-Bretagne*); the last four, Lower Brittany (*Basse-Bretagne*). Though the height of its mountains nowhere exceeds 1150 feet, their structure gives to the peninsula a wild and savage aspect. Clay-slate forms the centre of the country, and masses of granite rise in the north and the south. The climate is often foggy, and subject to violent storms of wind. Large tracts of land lie uncultivated; but in the well-watered

valleys vegetation is luxuriant. The peculiar shut-in situation and the characteristics of soil and climate in Brittany, seem to have had a powerful effect on the character of its people. The Breton has generally a tinge of melancholy in his disposition; and often conceals, under a dull and indifferent exterior, a lively imagination and strong feelings. He is passionately attached to his country and his customs, and is strongly averse to change. A bold seaman and steady soldier, he is devoted in his loyalty to time-honoured authority in church and state, and is capable of extraordinary devotion and sacrifice of self for his ideal. His piety is profound, although simple and unaffected; his pride, serious and self-respectful, entirely free from that petty peevishness and uneasy watching for small slights which so often belittle the real dignity of the Celtic nature. The manners of the natives might be called rude but for their simplicity. The percentage of illiterate persons in Morbihan is 50; in Loire-Inférieure, Côtes-du-Nord, and Finistère it sinks to 40; in Ile-et-Vilaine it is as low as 30. Thus book-learning, so far as regards French books, has hardly yet reached more than a half of Brittany, and the Bretons would be ignorant and uncivilised indeed but for a quite extraordinary wealth of traditional song and story, that serves effectively all the purposes of a national culture. Perhaps nowhere in the world has folklore reached such a high development, and this not less in quality than in quantity; for no traditional stories come near the Breton folk-tales, no popular poetry the Breton folk-songs. It must not be forgotten that there has long existed a pretty abundant literature, at least in religious subjects, in the Breton language, and that even in our day many natives are capable of reading this who do not read, and need not even speak, French. No part of Europe contains so many megalithic monuments as Brittany. Within the province are more than six hundred *dolmens*, and more than eight hundred isolated *menhirs*, and these, moreover, the grandest examples in the world. The largest, at Locmariquer in Morbihan, is 67 feet high and no less than 342 tons in weight. *Cromlechs* also are very common, some of rectangular form. The great *alignments* near Carnac, situated within a few miles of each other, are the most celebrated megalithic monuments in the world.

In ancient times, Brittany, under the name of *Armorica*, was the centre of the confederated Armorican tribes, who were of Celtic origin. Later it was known as *Provincia Lugdunensis Tertia*, but it never was more than nominally under Roman sway. Already entirely liberated in the 4th century, it became divided into several allied republican states, which afterwards passed into petty monarchies. The Franks called its turbulent and warlike population *Bretoni*; the Latin writers, since the 5th century, *Britanni* and *Brittones*; while the country was called *Britannia Cismarina*, also later *Britannia Minor*, to distinguish it from the island of Britannia across the Channel, and to mark the original identity in the populations of the two. Brittany became subject to the Franks in the reign of Charlemagne, and was handed over by Charles the Simple to the Northmen in the 10th century. After fierce struggles the Bretons at length acknowledged the suzerainty of the Norman dukes. Geoffroi, Count of Rennes, was the first to assume the title of Duke of Bretagne, in 992. The duchy of Brittany was incorporated with France in 1532 by Francis I., to whom it had come by marriage; and subsequently it shared in the general fortunes of the kingdom. Its local *parlement* at Rennes was of course merely its supreme court, which but rarely played a political

role. At the outbreak of the Revolution all the towns, and even some of the larger communes as well as the coast villages, embraced the new ideas, but the country-people mostly followed the lead of their curés and landlords, and remained intensely loyal to the ancient royal house. Brittany accordingly became the arena of a long and bloody struggle against dominant republicanism, its Chouans almost rivalling the Vendéans in the heroic stubbornness of their opposition to the Revolution; but it must be remembered that the revolt against the new ideas was at no time general as it was in Vendée. It was still smouldering so late as 1832, when there was an outbreak of popular feeling in favour of the elder Bourbons. Brittany has given many great men to France: Abélard, Duguesclin, the Connétable de Richemont, Jacques Cartier, Michel Columb, Dom Lobineau, Ducloux, Surcouf, Broussais, Laënnec, Jules Dupré, Duguay-Trouin, Kératy, Maupertuis, Chateaubriand, Lamennais, Jules Simon, and Renan, not to mention countless seamen and admirals. See Darn, *Histoire de Bretagne* (3 vols. 1826); Le Saint, *La Bretagne Ancienne et Moderne* (2d ed. Limoges, 1879); Loth, *L'Émigration Bretonne en Armorique* (1883); Joanne, *Bretagne* (1884); and Dean Church's essay (1846), full of insight and sympathy, reprinted in the first volume of his *Miscellanies* (1888).

Language and Literature.—The Breton (*Brezonck*, *Brezonack*; Fr. *Bas Breton*), the ancient language of Brittany, still called sometimes *Armorican*, to distinguish it from insular Breton, is one of those small Celtic tongues which have continued to be spoken languages down to the present time. It forms, together with Welsh in Wales, the last recently extinct Cornish in Cornwall, and that language known from a number of inscriptions to have been the tongue spoken by the ancient Gauls, the Cymric or southern group of the Celtic languages. It is at the present day spoken chiefly in the department of Finistère and the western parts of Côtes-du-Nord, and in Morbihan, and is still, according to the careful calculations of M. Paul Sébillot (in *La Revue d'Ethnographie* for January 1886), the ordinary language of about 1,322,000 persons, of whom no fewer than 679,700 know that language alone. The paper referred to contains maps showing village by village the existing limits of Breton and French. M. Sébillot estimates that by the close of the present century there will be no more than 100,000 persons ignorant of French, without, however, the Breton ceasing to be the 'vernacula lingua' of almost all the actual Breton country. Breton has four dialects: that of Vannes (*Vannetais*), of Quimper (*Cornewallais*), of Tréguier (*Trécorrois* or *Trégorois*), and of St Pol-de-Léon (*Léonais*), of which the last is the most important. The dialect of Léon is the purest of the four, although the narrowest in its geographical extent; while the Cornouaillais is the widest, and next to it the Vannetais. These dialects indeed follow very nearly the limits of the ancient dioceses. Breton is most closely allied to Cornish and next to Welsh, but it surpasses both these tongues in the refinement of its grammatical forms and words. Most competent scholars consider it as having been carried across the Channel from England in the settlement made in the 6th century. See Rhys, *Lectures on Welsh Philology* (2d ed. 1879), and Belloguet, *Ethnogenie Gauloise* (4 vols. 1858-75). The greatest service to the grammar and lexicography of the language has been done by Pater Gregoire of Rostrenon, Le Pelletier, and especially Le Gonidec (died 1838). The last wrote the best grammar (Paris, 1807; 3d ed. 1850), as well as an excellent lexicon (Angoulême, 1821; St Brieuc, 2 vols. 1847-50). Many valuable papers on questions of Breton philology have been

contributed to the *Revue Celtique*, which was commenced by H. Gaidoz at Paris in 1870, by Gaidoz, Ad. Pietet, Dr Stokes, Professor Rhys, D'Arbois de Jubainville, Le Men, Sauv , Luzel, and other scholars. At the present day Breton philology is brilliantly represented by two young scholars, Bretons both by birth and tongue: M. Loth, professor at Rennes, and M. Ernault, professor at Portiers. At the instigation of M. Loth, and mainly under his editorship, the Facult  des Lettres at Rennes has published since 1885 a review, *Les Annales de Bretagne*, devoted in great part to Breton philology. See also Whitley Stokes, *Middle Breton Hours*, with translation and glossary (Calcutta, 1876), and his *Old Breton Glosses* (Calcutta, 1879 and 1880; and reprinted in the 'Transactions of the [London] Philological Society' for 1886).

The Breton literature of the earliest period (since the 6th century) is grouped together with the Bardic literature of the British Isles. Many of the oldest and most famous of the bards (as Gweznou, Taliesin, Sulio) belonged perhaps to Brittany, and their strong and spirited poetry, partly of a patriotic and historical, partly an erotic character, may have had no small influence on the work of the French trouv res of the succeeding centuries. We need only allude to the Arthurian cycle of legend, worked up with such poetic wealth and variety of form by the medieval poets. The chief monuments of old Breton are two miracle-plays, a prayer-book or 'Hours,' a dictionary, and the cartularies of two monasteries. Of the plays, the first is founded on the life of St Nonna or Nonita, and exists in a manuscript ascribed by Zeuss to the 14th century. It was chiefly from this source, together with the two cartularies of the monasteries at Rhedon and Landevin, alluded to above, that Zeuss drew the materials for the Armorican part of his famous *Grammatica Celtica*. It was published in 1837 under the title of *Bukez Santez Nonn*, but a much better edition was given by M. Ernault in vol. viii. of the *Revue Celtique*. The second play, the *Barzaz breiz Jezuz*, the great miracle or mystery of Jesus, was edited by Hensart de la Villemarqu  in 1865, with a translation. It should, however, be added that this mystery has since been shown to be a translation from the French. As in course of time the French speech and culture spread over the country, and became the more familiar form for literary expression, the Breton struck root all the deeper into the affections of the common people, by becoming the chosen medium alone for the expression of their homely proverb, song, and story. Although it gradually ceased to be used for formal literary composition, Breton continued for centuries to be the medium through which the manuals of piety supplied by the church reached the faithful. The primitive manner of life preserved the conditions necessary not only for the transmission, but the creation of the folk-tale and the ballad, and genuine examples of these have continued to be produced by the free working of the popular imagination almost down to our own time. The extraordinary wealth of Breton popular literature was first revealed to the world, although under a somewhat fictitious garb, by La Villemarqu . His *Barzaz Breiz* (1839; Englished by Tom Taylor in 1865) professed to be the fruit of many years' collecting in every part of Lower Brittany, but unfortunately it cannot be accepted as a genuine undoctored product of the popular imagination in the proper and scientific sense. It consisted of *gwerziou* (plural of *gwerz*), heroic or mythological ballads, many of which are short, but some have as many as 600 verses; *soniou* (plural of *sonn*, or *s n*), love and festive songs; and religious poems; and was accompanied with translations and notes, and the original airs noted

in the sixth edition (1867), some of which had, however, been given already in the first edition. Other volumes of poetry in the Breton language were Luzel's *Bepered Breizad* ('always Breton'), consisting of original verse (Morlaix, 1865), and a fine collection under his editorship of genuine *gwerziou* or popular ballads chiefly in the dialect of Tr guier, *Gwerziou Breiz-Izel* (2 vols. 1874). M. Luzel, who is one of the most intelligent no less than patriotic representatives of 'Bretagne bretonnante' now living, as well as one of the most profoundly learned and scientific folklorists of France, is at present preparing a great collection of *soniou*. The legends of Brittany were worked up with fine effect by  mile Souvestre in his *Foyer Breton* (1844), and to their rare literary charm we owe some of the finest passages in the pages of George Sand and Renan. Since the 16th century, as has already been said, the native clergy have used the Breton speech for the composition of religious plays and hymns, as well as sermons and books of edification and instruction. At the present day there still appear one or two almanacs in Breton, some of which, however, are bi-lingual; while the journals issued in Brittany publish from time to time articles in the native language, and at election times there is a plentiful crop of Breton placards and posters; but it cannot be said that the Breton is now a cultivated language other than accidentally. The weekly journal *Feiz ha Breiz* ('Faith and Brittany'), which had a predominantly religious character, died at Quimper after nineteen years' existence (26th April 1884). There yet waited in Upper Brittany an ample harvest of folklore, no less than song and story, for the most learned and indefatigable of its editors, M. Paul S billot, the chief of whose collections are his *Contes Populaires de la Haute-Bretagne* (three series, 1880-82), *Litt rature Orale de la Haute-Bretagne* (1881), *Traditions et Superstitions de la Haute-Bretagne* (2 vols. 1882), *Contes de Terre et de Mer, L gendes de la Haute-Bretagne* (1885), and *Contes Populaires de la Haute-Bretagne* (1886). And from La Villemarqu 's own ground, Lower Brittany, M. Luzel has given the world the rich gleanings of years in *L gendes Chretiennes de la Basse-Bretagne* (2 vols. 1881) and *Contes Populaires de la Basse-Bretagne* (3 vols. 1887), two invaluable collections that have a place on the shelves of all folklorists everywhere. There is also a good collection of Breton proverbs, 'Lavarou-Koz,' by L. F. Sauv  (1878). See a fine paper by Henri Gaidoz on 'La Po sie Bretonne pendant la guerre de 1870-71,' in the *Revue des Deux Mondes* for December 15, 1871; and for other books and papers the 'Bibliographie des Traditions et de la Litt rature Populaire de la Bretagne,' by H. Gaidoz and Paul S billot, in vol. v. of the *Revue Celtique*.

Brittle-stars (Ophiuroidea), one of the classes of Echinodermata, including forms not far removed from starfishes (Asteroids), but differing markedly in the more centralised body, more sharply defined arms, and more active habit. Compared more fully with starfishes, the brittle-stars are more muscular and less limy; the arms do not contain digestive ceca from the gut nor reproductive organs, and are supported by an axis of central limy bodies like vertebrae; the tube-feet are smaller, probably simply tactile, and locomotion is effected by the muscular wriggling of the arms; the groove so well seen on the ventral surface of the starfish arm is here closed in by limy plates; the alimentary canal is blind—that is, without anus; the entrances to the water-vascular system (madrepore plates) are ventral; and the larval form is quite different. The popular name 'brittle-star' refers to the extreme ease with which the arms break; another common name, 'sand-stars,' refers less happily to

their occasional occurrence on the shore; the technical title Ophiuroid describes the snake-like coils of their 'arms.' The commonest British species are the Common Sand-star (*Ophiura texturata*), the Lesser Sand-star (*O. albida*), and the Common Brittle-star (*Ophiocoma rosula*). Another important genus is Euryale, to which the Basket-fish or Argus Starfish belongs. See ECHINODERMS, STARFISH.

Britton. JOHN, topographer and antiquary, the son of a small farmer and village shopkeeper, was born in 1771, near Chippenham, Wiltshire, and, losing his parents young, received but a scanty education. At sixteen he went to London, and was in turn cellarman, clerk, and compiler of a song-book. Some contributions to a dramatic miscellany led the publisher to employ him, with a young friend, Brayley, to compile the *Beauties of Wiltshire*; its success led up to the *Beauties of England and Wales*, on behalf of which the joint authors travelled 3500 miles to inspect the localities described, and which cost £50,000. They also prepared the *Beauties of Bedfordshire* in the same manner. Britton afterwards issued a more elaborate work, entitled the *Architectural Antiquities of England*. He died in London, January 1, 1857. One of the most important of his publications was *The Cathedral Antiquities of England* (14 vols. folio and 4to, 1814-35, with upwards of 300 highly finished plates). Altogether, his illustrated works number eighty-seven, besides others of a similar kind which he edited. Britton was amongst the first to combine and popularise antiquarian and topographical description, and by his letter to Joseph Hume in 1840 on the preservation of ancient monuments, he anticipated the Act of 1882. See his *Autobiography* (1850).

Brive-la-Gaillarde, a town in the French department of Correze, 55 miles SSE. of Limoges by rail. Pop. 13,445.

Brixen, a town of Tyrol, on the Brenner Railway, 57 miles SSE. of Munich. It is the seat of a prince-bishop, and has several monasteries and a theological seminary. Pop. 5842.

Brixham, a market-town and seaport of Devonshire, England, on Tor Bay, 25 miles S. of Exeter (32½ by rail). It is an irregular place, sprinkled over three valleys and four hillsides; picturesque, though possessed of no architectural features, and fishy as even few fishing-towns. Great quantities of fresh fish are sent to London, Bath, and Bristol; several vessels are engaged in the foreign and coasting trade; there is a little shipbuilding; and the place is a favourite sea-bathing resort. There are iron-mines, limestone quarries, mineral-paint works, and a bone cave on Windmill Hill, discovered in 1858, which contained bones of the mammoth, rhinoceros, horse, reindeer, hyena, bear, &c., besides palæolithic flint implements (see CAVE). Kent's Cavern (q.v.) is beyond Torquay (q.v.), at the other end of the bay. At Berry Head is a Roman camp. It was at Brixham that William of Orange landed, November 4, 1688. Pop. (1851) 5627; (1881) 5366; (1891) 6224.

Brixton is a district of London (SW.), in Lambeth parish.

Briza, or QUAKING GRASS. See GRASSES.

Broach, BAROACH, or BHARUCH, a town of Guzerat, Bombay Presidency, 228 miles N. of Bombay by rail, on the north bank of the Nerbudda, from whose inundations it is protected by a river-wall, 30 to 40 feet high, built of large blocks of stone. Eighteen hundred years ago Broach was one of the chief ports of Western India, and its foreign commerce did not absolutely disappear

until the end of the 18th century. In the 16th century the Portuguese reported it a town of weavers, 'who make the finest cloth in the world;' this fame led to the founding of English and Dutch factories here in the following century, and even yet its hand-loom weaving is of importance. Broach was taken by the British in 1772, ceded to Sindhia in 1783, and again stormed by a British force in 1803, since which date it has remained a British possession. It carries on a small coasting trade, the principal exports being raw cotton, grain, and seeds. There is a Hindu hospital for old and sick animals, maintained at a cost of £530 annually. Broach passed from the Moguls at the death of Aurungzebe to the Mahrattas. Pop. 40,168, including many Parsees and Jains.—The district of Broach, an alluvial plain sloping westwards to the shores of the Gulf of Cambay, is 54 miles in length, and from 20 to 40 miles in breadth, with an area of 1453 sq. m. The black soil of the district is highly fertile. There is a railway bridge of 67 spans over the Nerbudda, with a length of 4122 feet.

Broad Arrow, a government mark, thus, stamped, cut, or otherwise fixed on all solid materials used in Her Majesty's ships or dockyards, and on government stores of all kinds, in order to prevent larceny. The origin of the mark is obscure; Walford (*History of Newcastle*, vol. iii. 1884) says it was used in 1598 by the collector of customs in Newcastle as a mark for goods seized. The acquittal of a dealer in marine stores prosecuted for having in his possession certain stores bearing the broad arrow of his majesty, led to the passing of the Act of 1698, which enacts that persons in possession of naval stores, or goods of any kind marked with the broad arrow, or other marks therein mentioned, and usually employed in marking naval stores, shall forfeit all such goods and £200, and also pay costs. The mark is for iron, wood, &c., what the colour-thread is for sail-cloth and ropes, as it enables the smallest piece of such articles to be identified as government property.

Broad-bill. See SHOVELLER.

Broad-bottom Administration, a name derisively applied to the ministry formed by Henry Pelham in 1744, because it professed to include all parties of weight and influence in the state in a grand coalition, and comprised no less than nine dukes. Thus for a time the Whig party were reunited, and even Tory support secured. The ministry was dissolved in 1754, by the death of Pelham, though several of its original members had succeeded long before.

Broad Church. See ENGLAND (CHURCH OF).

Broadmoor, in SE. Berkshire, 2 miles from Wellington College Station, is the state asylum for 500 criminal lunatics. It is a large brick building, opened in 1863.

Broads, THE NORFOLK, are a series of inland lakes usually said to be formed by the widening or 'broadening' out of the rivers. More probably their origin is due to a change in the general level of the land surface of the county; for even within historic times the river Yare was an estuary of the sea, in which herrings were caught at the time of Domesday. The broads *par excellence* are those up the Bure or North River (which empties itself into the sea at Yarmouth), and its tributaries the Ant and the Thurne. On the Bure leaving the comparatively hilly land north of Wroxham, it enters a flat marshy country very little above high-water mark, and right and left of it are the well-known broads of Wroxham, Salhouse, Hoveton, Horning, and Ranworth, all of which can be seen from the main river, and are approached from it by more

or less narrow waterways or cuts. The first (Wroxham) is the largest and deepest, there being sailing-water for large boats all over it; but some of the others are very shallow, and are fast growing up owing to the accumulation of decayed vegetable matter, which is gradually adhering to the banks. There is indeed no doubt that a hundred years ago there was double the area of open water here that there is now, and some broads—e.g. that at Dilham, where not so long ago sailing matches were held—are now simply a reed bush, with hardly any water visible. Up the Ant there is the fine broad at Barton and another at Sutton; but the latter is fast closing up, and is covered with water-lilies, and both these are inaccessible to large yachts, owing to the smallness of the bridge at Ludham stopping the way. Up the Thurne there is a very large broad at Hickling, and two others at Martham and Horsey, and these are all of note in the east part of the county, on which it is possible to sail; for the three fine broads of Ormesby, Rollesby, and Filby, though connected and forming a chain, have no practicable outlet to the river. The Yare or Norwich River has no broads on which sailing is possible, but the visitor at Norwich will find those at Surlingham, Strumpshaw, and Rockland well worthy a visit, and very accessible by rail. Near Lowestoft, on the Waveney, is Oulton Broad, but this is near the town, and possesses few of the charms of the other sheets of water named. The broads have grown greatly in favour with holiday-makers of late—for where twenty years ago it was possible to sail from end to end of the Bure without meeting more than two or three yachts, it would now be hard any fine Saturday, during August and September, to find a mooring-place by Wroxham Bridge, where perhaps a hundred yachts may be seen at once, the place resembling Henley at a regatta time. The great influx of visitors has of course sent up the prices of everything, and has destroyed the extreme quiet which was the great charm of the place to naturalists and fishermen. Still the strange scenery—the great expanse of the landscape, and the rank profusion of vegetation and flowers of all sorts, the lofty reed bushes especially attracting attention—will always render the spot a pleasant one, and the keen air being especially beneficial to invalids, it will always be recommended by doctors. Game and fish abound, but it must be clearly understood are as jealously preserved here as anywhere else, and though plover, moorhen, and an occasional duck and heron, can be shot from the deck of a yacht, the sportsman is liable to heavy fines if he lands on the bank to pick up what he has shot. Still the occasional visitor is not generally interfered with if he leaves the game alone. Fish, and especially pike, perch, bream, and rudd, are very plentiful still; but there are only the rivers and one or two broads free to all, though permission is generally easily obtained. For the coarse fish it is absolutely necessary to ground-bait liberally in order to bring the fish to the spot. To the antiquary the district is full of interest, the ruins of St Benet's Abbey, of Burgh Castle (Roman), and many interesting churches, being within easy reach. See G. A. Davies' *Norfolk Broads* (1884), Walter Rye's *Month on the Norfolk Broads* (1887), and Emerson and Goodall's *Life and Landscape on the Norfolk Broads* (1887).

Broadside, the simultaneous discharge of all the guns on one side of a ship of war. The fighting power of a ship used to be estimated by the weight of all the shot and shell that could be fired off at once from one side or half of the ship. Thus, the broadside of the old-fashioned *Duke of Wellington*,

131-gun war-steamer, amounted to 2400 lb. With ironclad turret-ships the term is inapplicable. See NAVY.

Broadsides. See CHAPBOOK.

Broadstairs, a quiet watering-place in Kent, $1\frac{1}{2}$ miles NE. of Ramsgate, so named from the breadth of the sea-gate or *stair*, which was formerly defended by a gate or archway. Near it is a noble orphanage, founded by the wife of Archbishop Tait, who lived much in the vicinity. Dickens was a frequent visitor. Pop. 5322.

Broadsword, a sword with a broad blade, usually for cutting only, not stabbing. See CLAYMORE.

Broca, PAUL, a distinguished French surgeon and anthropologist, was born at Sainte-Foy-le-Grande, Gironde, in 1824. After pursuing his medical studies with distinction, he was named professor of Surgical Pathology in the Faculty of Medicine at Paris, and surgeon successively of the four hospitals of Bicêtre, the Salpêtrière, Saint Antoine, and La Pitié. He was also director of the Laboratory of Anthropology in the High School of Paris. Celebrated not only as a surgeon, Broca was regarded as one of the most learned masters of the existing school of anthropology. He founded the Paris Anthropological Society, of which he was secretary till his death, and he was a member of all the leading medical, biological, and anatomical societies of Paris and the Continent. Elected a member of the Academy of Medicine in 1866, he was decorated with the Legion of Honour in 1868. Broca was a voluminous writer, and among his more important works may be cited the following: *Des Anévrismes et de leur Traitement* (1856), *Sur l'Anesthésie Chirurgicale Hypnotique* (1859), *Études sur les Animaux Récussitants* (1860), *Instructions Générales pour les Recherches Anthropologiques* (1865), *Traité des Tumeurs* (1865), *Caractère Physique de l'Homme Préhistorique* (1868), and *L'Anatomie Comparée de l'Homme et des Primates* (1869). He also collaborated in the production of several important medical and physiological works. In 1878 he presided over an International Congress on Anthropology held in Paris. He died July 9, 1880.

Brocade (Span. *brocado*). This term is applied to a kind of figured silk resembling on the one hand a damask, and on the other a piece of embroidery. To some extent it partakes of the character of both, but a piece of silk, woven on the old hand-loom with a slightly raised pattern somewhat resembling a piece of embroidered work, was called a brocade. The name is now applied to a figured silk with a satin or cord ground in which several colours are used, and in which a coloured thread (or more than one) is put in by a shuttle only travelling a short distance, or just the width of a flower or figure. This part of the pattern is technically said to be 'brocaded in.' A brocade may only be of silk on the face, and the back of some other material. Johnson defined the term as meaning 'a silken stuff variegated with gold or silver, and raised and enriched with flowers and various sorts of figures, originally made by the Chinese.' With the exception of those woven in modern times, brocades are very generally composed in part of gold, silver, or gilt silver threads.

Oriental brocades date from a remote period, but there were probably no European stuffs of this nature earlier than the 13th or 14th century, when they were made in Italy and Spain. In common with damasks, figured tissues, and other varieties of ornamented silks made in past times, Italian and Spanish brocades, dating from the 14th to the 17th century, as well as those of Persia and Asia Minor, extending over a longer period of time, are extremely valuable objects of study for the textile designer and decorative artist. Their richness,

beauty, and variety of pattern are very great. The French brocades of the 18th century, and even some of quite modern date, are also interesting in an artistic sense. Fine examples of all these are to be found in some continental museums. The collection at South Kensington is very rich, and is being made available to persons at a distance by highly finished chromo-lithographs of the best pieces, already partly published under the supervision of the authorities of that institution. Some interesting specimens of these fabrics can also be seen in the museums of Manchester, Edinburgh, and Dublin.

Brocage Bonds, or bonds securing a reward for the promotion of a marriage by influence to be used, are void by the law of England and of Scotland.

Broccoli, a well-known and much-esteemed garden vegetable, one of the many varieties which cultivation has produced of the *Brassica oleracea*, the common kale or cabbage. Broccoli is said to have been originally brought to Italy from Cyprus about the middle of the 16th century. Its name is Italian. It is merely a variety of the Cauliflower (q.v.), with the same general characteristics, but a harder constitution, which enables it to withstand all but our severest winters. Many improved sub-varieties have been introduced within the past fifteen or twenty years, with greater delicacy of flavour and purity of colour, while the original hardy constitution of the race has remained unimpaired. Some of the varieties are early in coming into use from the time of sowing, and others late, and by a judicious selection and a careful study of the times at which each should be sown, broccoli may be made to span the period when cauliflower ceases, in October or November, till it may again be had in June. The trade in broccoli during winter and spring is very great. All British markets are supplied chiefly from Penzance in the early months of the year, the winter climate there being particularly favourable to its early production. The market-gardeners around Edinburgh are noted for the high excellence of the broccoli they produce in the later spring months, and are able to keep up the supply after that of the southern growers fails, and till the first crops of cauliflower come in. See BRASSICA.

In the cultivation of broccoli the seeds are sown in the open ground in April and May, thinly, so that the plants may not become crowded while they remain in the seed-bed. Deep rich loam is requisite to produce the best quality. The plants are finally planted out in June and July, at distances of from two to three feet apart, according to the vigour and bulk eventually attained by the individual sorts. Frequent stirring with the hoe or the fork between the plants is conducive to vigorous growth. In severe winters it is necessary to protect the plants by some means from frost. The most usual means practised is that of digging the soil away from the northern side of each plant, and laying the latter with an angle towards the north. The overhanging leaves prevent the lodgment of rain and snow in the hearts, and offer some protection also against frost, but the size of the heads is usually somewhat diminished by the check administered to the growth. When only small quantities are grown, they may be effectually protected by spreading litter over them when frost is severe, but in the case of large quantities this would prove too laborious and costly.

Brochs (O.N. *borg*; A.S. *burh*, *burg*; Eng. *burgh*, *borough*; Scot. *brough*, 'a fortified inclosure or castle'), the local name applied in the north of Scotland to the ancient, dry-built, circular castles, known also to the Gaelic-speaking people as *duns*,

and to antiquaries (since Pennant's time) as 'Pictish towers,' of which Mousa and Clickimin in Shetland, Dun Dornadilla in Sutherland, Dun Carlaway in Lewis, and the two in Glenbeg of Glenelg (called Castle Tellve and Castle Troddan by Gordon) are the best-known examples. These circular castles appear to have been more thickly planted along the straths of the northern counties, and around the shores and in the lochs of the northern and western isles, than the later *peels* in the Border valleys. The sites or ruins of more than two hundred are known in the three northern counties. They occur also in very considerable numbers in Ross, Inverness, and Argyll, and a few examples are known in the counties of Perth, Forfar, Stirling, and Berwick. It is only in recent years that the structural characteristics of the brochs and their relation to the other antiquities of the country have been disclosed, chiefly by means of an extensive series of excavations made at the instance of the Society of Antiquaries of Scotland, the details of which, with plans, sections, and measurements of many of these singular edifices, are published in their *Transactions*. The general conclusion is that these structures, which are peculiar to Scotland, belong to a period subsequent to the colonisation of Britain by the Romans, and continued in use, at least in the more northern districts, till after the close of the Viking period of the Northmen, or approximately from about the 6th to about the 10th century. The typical broch, of which Mousa, situated on a small islet near Lerwick, in Shetland, is the best preserved

Broch of Mousa.

example, is a circular tower, built without mortar, the wall 15 feet thick, inclosing a circular area or court 30 feet in diameter. The exterior face of the wall has a slight batter or set inwards; the interior face is perpendicular, but has a ledge or set backwards, at a height of about 8 to 10 feet. There is no opening to the exterior except the door, which is always on the ground-level, and usually about 6 feet in height by about 30 to 36 inches wide. This doorway, or tunnel-like passage, into the interior court through the thickness of the wall, is provided with cheeks or rebates for a door, with holes in the wall behind them for a long horizontal sliding bar, and these are always placed at some distance within the passage-way, which is further defended by a guard-chamber opening in the thickness of the wall on one or both sides. Round the inside of the court, on the ground-floor, there are, in some cases, doors placed at intervals opening into chambers with beehive roofs, formed in the thick-

ness of the wall. In other cases the wall is solid, except on the left of the main entrance, where there is one opening or doorway, which gives access from the court to a stair in the thickness of the wall leading to the upper stories. Above the first 8 or 10 feet of its height the whole wall is divided, and carried up with a space of about 3 feet between its outer and inner sections, which is traversed horizontally by floors of flagstones at vertical intervals of little more than a man's height. These flagstones are securely bonded into both walls, and each horizontal series passing all round the building forms a floor to the vacant space or gallery above it, and a roof to the gallery below. The stair either crosses all the galleries at one slope, or goes from one to the next by making the floor of each gallery a longer or shorter landing to the next flight of steps. The galleries are

Section of Broch of Mousa.

lighted from the court or inner area of the tower, which is open to the sky. The windows are placed in perpendicular rows, separated from each other only by the thickness of the flagstone which forms the top of one window and the sole of the next above it. No broch being now complete in its upper parts, it is not known what may have been the original height, or the actual number of superposed galleries. Mousa is still 40 feet high, and shows six galleries, and Dnn Carloway, which is still 34 feet high, shows five galleries. The brochs vary considerably in size on the ground-plan, the largest known being 70 feet in diameter, and the smallest 40 feet. The average of thirty-one examples is: Exterior diameter, 55½ feet; inner area or court, 28½ feet; thickness of wall, 13½ feet. Many of them have wells within the court, or near the exterior, in which case there is usually a covered way leading to them. Some have drains passing out of the court under the wall. Some are defended by outworks, others completely surrounded by ditch and rampart. In many cases they are placed on promontories cut off from the land by a ditch, or defended by ramparts, while in other cases they are built on islets in lochs, with a causeway of stepping-stones to give access to the islet. At Clickemin there is a gatehouse with guard-chambers at the end of the causeway. But their most remarkable feature is the persistent uniformity of plan and construction which characterises the whole, though with such diversity of detail that no two are exactly alike. Their purpose appears to have been to provide places of secure refuge for the agricultural population, to which they might have recourse with their goods and cattle while the danger of plunder and murder by marauding bands was imminent. The brochs could only be reduced by investment, and as the

maranders' object was to scour the country quickly and get away with their plunder, they could not stay to besiege such strongholds. It is on record that Mousa was once besieged by Harold, Earl of Orkney, about 1155 A.D., but the earl failed to take it, because 'it was difficult to take by assault, and the besieged had made great preparations' to enable them to hold out. The affinities of the typical structure, however, are so distinctively Celtic that none of its essential features have been observed in any construction outside of the Celtic area. The general character of the relics obtained from the systematic excavation of the brochs (of which a collection of some thousands is deposited in the Scottish National Museum) is also clearly Celtic, and of post-Roman times. They show that the occupants cultivated grain, kept flocks and herds, and hunted the forests and fished the seas for their sustenance, that their tools and weapons were swords, spears, daggers, axes, knives, and chisels of iron, and their ornaments, rings, bracelets, pins, and brooches of brass and silver. They made these implements and ornaments themselves, as the moulds, crucibles, and cakes of rough metal found in different brochs testify. Of the bones and horns of animals they made pins, needles, bodkins, buttons, combs, spindle-whorls, and playing-dice, and many other furnishings of everyday life and industry. They made beads and bracelets of jet or lignite, and they had finer beads of variously coloured vitreous pastes, enamelled on the surface with spiral and other patterns. They also made beads and discs of highly polished stone, such as serpentine, marble, and mica-schist. From the commoner varieties of stone they made querns or hand-millstones, mortars, pestles, hammer-stones, whetstones, bowls, cups with handles, lamps, and culinary vessels of various kinds. Their pottery was often fine in shape and finely ornamented. They practised spinning and weaving to a large extent, as many as eighteen weaving-combs and thirty spindle-whorls having been found in a single broch.

For early notices of brochs, see Gordon's *Itinerarium Septentrionale* (1720); Pennant's *Tour in Scotland* (1769-72); Low's *Tour through Orkney and Shetland in 1774*, published at Kirkwall (1879); Pococke's *Tours in Scotland, 1747-60*, published at Edinburgh by the Scottish History Society (1887). For recent excavations of brochs, with plans and detailed descriptions, see *Archæologia Scotica*, vol. v., and Dr Joseph Anderson's *Scotland in Pagan Times* (1883).

Brochure, a French word (from *brocher*, 'to stitch'), equivalent to the English word Pamphlet (q.v.).

Brocken (*Mons Bructerus* of the Romans), popularly known as the *Blocksberg*, the highest summit of the Harz Mountains, is situated in Prussian Saxony, about 20 miles WSW. of Halberstadt, and has an elevation of 3740 feet above the sea. It holds an important place in the folklore of North Germany. There the pagan worship lingered long after the introduction of Christianity, and there the superstition of the 16th century annually assembled the witches on Walpurgis Night (q.v.), to hold their revels on its summit. The mountain is also interesting for the phenomenon known as the 'Spectre of the Brocken' (see MIRAGE). Two carriage-ways lead up to the hotel on the treeless, granite-strewn summit, where snow lies generally from November to June; visitors are numerous during the summer months; and in clear weather a fine view is obtained.

Brockhaus, FRIEDRICH ARNOLD, the founder of the well-known firm of Brockhaus in Leipzig, and publisher of the *Conversations-Lexikon*, was

born at Dortmund, May 4, 1772. In 1802 circumstances led him to Holland, but he returned to Germany in 1810, and in the following year commenced business in Altenburg. Before this, however (in 1808), he had purchased the copyright of the *Conversations-Lexikon*, which had been commenced by Löbel in 1796, and was completed in 1811. In 1812 a second improved edition of the work was commenced under the supervision of Brockhaus as editor. In 1817 his business had so increased that he found it necessary to leave Altenburg for Leipzig, where, in the following year, he commenced book-printing in addition to book-publishing. Through all the enterprises of Brockhaus as a publisher, a zealous devotion to the cause of liberty and general enlightenment may be traced. He died August 20, 1823. See his *Life and Letters* (3 vols. 1872-81). The business was afterwards carried on by his sons Friedrich (1800-65) and Heinrich (1804-74); from 1850 by the latter alone, and now by Heinrich-Rudolf and Heinrich-Eduard, his sons. The *Conversations-Lexikon* has continued to be a conspicuous success; its 13th ed. (for the first time illustrated), in 16 vols., was published, with a supplementary volume, 1882-87. The 4th ed. of an abridged edition of the work was published in 1885 in 2 vols. Another publication, issued by the house (since 1831), is the monumental work, *Allgemeine Encyclopädie der Wissenschaften und Künste* of Ersch and Gruber, begun in 1818, and still unfinished (168 vols. up to 1888).

HERMANN BROCKHAUS, third son of F. A. Brockhaus, was born at Amsterdam, January 28, 1806; studied at Leipzig, Göttingen, and Bonn, and lived successively in Copenhagen, Paris, London, and Oxford. From 1848 till his death, he held at Leipzig the chair of ordinary professor of the Sanskrit Language and Literature. Among his several works on oriental literature may be mentioned the edition of the *Fables of Somadeva*, *Kathā Sarit Sāgara* (1839-66); of the Persian version of the 'Seven Wise Masters' (1845); and of the 'Songs of Hafiz' (1854-60). He died at Leipzig, January 5, 1877.

Brockram (signifying 'broken rock') is the local name given to the breccias of Lower Permian age which occur in the north of England, or near Appleby and Kirkby-Stephen. These breccias consist largely of fragments of limestone set in a red sandy matrix, and are occasionally quarried for limestone and building-stone.

Brockton, formerly called North Bridgewater, is a post-village of Massachusetts, U.S., 20 miles S. of Boston. It manufactures boots. Pop. (1880) 13,608; (1890) 27,294.

Brockville, a town of Ontario, on the left bank of the St. Lawrence, 125 miles SW. of Montreal. It is on the Grand Trunk and the Brockville and Ottawa railways, and a port of call for steamers on the St. Lawrence. It took its name from Sir Isaac Brock (1769-1812), who fell in the battle of Queenstown. Pop. (1891) 8793.

Brodie, SIR BENJAMIN COLLINS, Bart., surgeon, was born at Winterslow Rectory, Wiltshire, in 1783. He studied under Sir Everard Home at St. George's Hospital, to which he was in 1808 elected assistant-surgeon, and afterwards surgeon. He had previously lectured both on anatomy and on surgery. In 1810 he was elected a Fellow of the Royal Society, and in 1811 received their Copley medal. In 1834 he was created a baronet, and he held the appointment of serjeant-surgeon to Queen Victoria. He was made D.C.L. of Oxford in 1850; was president of the Royal Society, a corresponding member of the Institute of France, and a foreign member of other learned societies

and academies in Europe and America. Among his works were: *Lectures on Local Nervous Affections* (1837), *Introductory Discourse on the Duties and Conduct of Medical Students* (1843), *Psychological Inquiries as to Mental Faculties* (1854); and an *Autobiography*, forming part of the collected edition of his works (1865). He died at Broome Park, Surrey, 21st October 1862.—His son, Sir B. C. BRODIE, born in 1817, was in 1855 appointed professor of Chemistry at Oxford. He was the discoverer of graphitic acid. He died 24th November 1880.

Brody, a town of Galicia, is situated on a swampy plain, surrounded by forests, 89 miles ENE. of Lemberg by rail. Leather and flax manufactures, breweries, refineries, and fur-dressing are carried on. The trade, which has fallen off lately, is almost entirely in the hands of the Jews, who form three-fourths of the inhabitants, so that Brody has been called the 'German Jerusalem.' Pop. 17,534.

Broek, long famed as 'the cleanest place in the world,' is a village 6 miles NE. of Amsterdam, with a great dairy farm. Pop. 1553.

Brogie, a prominent French family, of Piedmontese origin: its most important members have been the four dukes of the name: (1) FRANÇOIS MARIE, first Duc de, marshal of France, born 1671, took part in every campaign from 1689, and died in 1745.—(2) VICTOR FRANÇOIS, his son, born 1718, was the most capable of the French commanders in the Seven Years' War. Made a marshal in 1759, he entered the Russian service after the Revolution, and died in 1804.—(3) ACHILLE CHARLES LÉONCE VICTOR, grandson of the last, and son of Prince Claude Victor (born 1757, guillotined 1794), born in 1785, was distinguished as a Liberal politician and an earnest advocate for the abolition of slavery. He was foreign secretary (1832-34) and prime-minister (1835-36) under Louis-Philippe; after 1851 he lived in retirement, and died in Paris, 25th January 1870. He was a member of the Academy, and published *Écrits et Discours* (3 vols. 1863), whilst the fourth and last volume of his *Souvenirs* appeared in 1887.—(4) JACQUES VICTOR ALBERT, his eldest son, born 13th June 1821, early entered the field of literature, and was elected an Academician in 1862. Returned as a deputy in 1871, he was till May 1872 ambassador at London; he then became leader of the Conservative right centre, and with a view to force a monarchical government on France, he brought about the resignation of Thiers, and the election of MacMahon, in 1873. He was twice premier—in 1873-74 and in 1877—resignation being on both occasions forced on him by Gambetta's exposure of his reactionary tactics. His most important works are his orthodox *L'Église et L'Empire Romain au IV. Siècle* (6 vols. 1856-69), *Le Secret du Roi* (3d ed. 2 vols. 1879), and two hostile works on Frederick the Great, from family papers (1882 and 1884).

Brogue (Irish and Gaelic *bróg*), a light shoe formed of one piece of hide or half-tanned leather, gathered round the ankle, which was formerly much in use among the native Irish and the Scottish Highlanders, and of which there were different varieties.—The term brogue is also used to signify the peculiar pronunciation of English that distinguishes natives of Ireland.

Broiling is a convenient and expeditious mode of cooking small pieces of meat, by laying them on a gridiron over a bright fire, or even on the coals themselves. This is perhaps the most primitive mode of preparing meat for eating, as may be supposed from the great ease and simplicity with which the operation is managed. Broiling is, in fact, a quicker sort of roasting. The albumen

of the outside being sealed up at once, the meat is cooked in its own juices and rendered extremely nutritious. But to broil meat so as to preserve its odour, juice, and fat, requires care. The fire should be perfectly clear. Just before setting the gridiron over, some salt should be sprinkled on it to prevent the flare. The gridiron should be perfectly clean, and warmed and greased with suet before using. The meat should never be touched with a fork, but turned rapidly with the broiling tongs. In large ranges there should be a broiling stove, and an apparatus for broiling suited to it; by this the heat of the fire can be easily regulated. But for all ordinary purposes, a fire of charcoal, or of common coal, and a grooved gridiron, to preserve the gravy, is all that is necessary. Sometimes a gridiron is used to hang before the fire, when a dinner is being dressed and the top of the fire occupied; this is convenient, but it is an inferior way of cooking, the meat being roasted rather than broiled.

Broke. SIR PHILIP BOWES VERE, rear-admiral, born at Broke Hall, near Ipswich, 9th September 1776, entered the service in 1792, was made captain in 1801, and appointed to the *Shannon* frigate, 38 guns, in 1806. In her he fought the memorable duel with the American *Chesapeake* frigate, off Boston, 1st June 1813, which has made 'brave Broke' ever since a hero in popular English song. The Americans were confident of success, but proved no match for Broke's hardy and thoroughly disciplined men, who, after delivering with excellent effect two terrific broadsides, sprang across the gunwale, and, after a moment's struggle, ran up the English colours fifteen minutes after the commencement of the action. A blow received in boarding seriously affected his health, and he retired from active service with a baronetcy. He died in London, 2d January 1841. See his *Life* by Dr Brighton (1866).

Broken Hill. See SILVERTON.

Broken Knees. The part commonly termed the knee of the horse corresponds to the carpus or wrist of man; it is much exposed, and liable to serious injury. By *broken knee* is meant the abrasion or more serious injury of the front of the joint by a fall; and if, even after the wound has healed, the scar remains to indicate that the horse has once fallen, and is 'broken-kneed,' then that horse is regarded as unsafe, unsound, and is seriously deteriorated in value.

A horse may fall from various causes: (1) Defective conformation, which induces 'speedy cutting' and 'brushing,' consequently pain and falling; (2) diseases of the feet, either intrinsic or extrinsic, causing the animal to shuffle more or less in its gait, and to stumble; (3) brain affection, causing a sudden stumble and fall; (4) accident pure and simple, such as putting the foot on a large stone or broken post in the ground. See HORSESHOEING.

After a fall, it is important at once to determine the extent and depth of the wound. If it be merely a superficial wound, the case is a simple one; and unless the skin is much bruised, the hair will grow, and the animal not be permanently blemished. The sheath, however, through which the tendon over the joint passes, may be opened, and the tendon itself injured. The wound is then gaping, heals rather slowly, and sloughs are thrown off. Lastly, the joint itself may be opened, and this is indicated by a discharge of the joint-oil or synovia, and by the bones being seen. The worst form of accident is that when the bones of the joint are fractured. The system suffers when the wounds are serious, and severe fever sets in.

In treatment, first cleanse the wound by pouring

or squeezing from a sponge warm water on it, and ascertain by looking, but not by probing, the extent of the injury. If the injury be slight and no joint-oil escape, tie the animal's head to the pillar reins, to keep it from lying down, and from injuring the part by knocking it against the wall or manger. Give opening medicine, bran mashes, and a little hay or grass. Dress the wound daily with antiseptic lotions or with antiseptic lint. If the injury be a serious one, and is accompanied by fever, the animal must be at once placed in 'slings,' and in addition to the before-mentioned treatment should receive febrifuges and anodynes. When the bones are broken, the animal should be destroyed. When the wound is thoroughly healed, the hair may not grow rapidly, nor may the swelling disappear; in this case its production may be accelerated by the use of a mild cantharidine ointment, which should act as an irritant, but not as a blister. In some cases of severe broken knee, it is advisable to fix the limb so that the animal may not move the joint. In veterinary jurisprudence, a broken knee is regarded as a *blemish*, not as an unsoundness. An animal once broken-kneed never thoroughly regains its previous action.

Broken Wind is a disease or unsoundness of the respiratory organs of the horse, which was termed by some old English writers *pursiness*. The nature of the malady is of a reflex, nervous origin, and appears in the form of difficulty in the act of expiration, the horse making an extraordinary or second effort to expel from the lungs the air which has readily entered them during inspiration.

A broken-winded horse is usually an animal that does not thrive, is lean, and has a dependent belly, the muscles of which are unusually active as expiratory muscles. The characteristic symptoms are best observed when the horse is exercised, the breathing becoming very laboured, the nostrils dilated, the eyes bloodshot, and even blue, showing imperfect purification of blood in the lungs. On watching the chest and flank, the expiratory effort is seen to be double, the animal taking two jerks to expel the air from the lungs. A broken-winded horse has a cough, which is low and hardly heard at a distance of a few yards, and which is usually accompanied by the passage of flatus from the anus. When the animal is oppressed by fast work, or dragging a load up a hill, the pulse is excessively rapid, and the heart beats energetically.

Low-bred horses are liable to broken wind, especially if improperly fed on innutritious and bulky food, and at the same time kept at hard and fast work. It is a dietetic disease, and is due to the irritation in the stomach, caused by indigestible food, being reflected from the nerves of the stomach to those of the lungs—in the same way as with ourselves, disease in one tooth seems to set all the other teeth aching. As a matter of fact the nerves of the stomach and lungs have a common origin, and consequently are easily affected one through the other. This indirect irritation causes firstly spasm, and later on relaxation of the little muscles around the air-tubes; consequently too much air gets into the lungs, and causes pressure on the walls of the air-vesicles, terminating in wasting and rupture of them. The result of the destruction of air-vesicles is a lessened area for the aeration of the blood, and is followed by debility and loss of condition. On post-mortem examination we find the stomach much distended with food of a dry nature, and its walls thinned. The lungs are lighter in colour, and float much more buoyantly than in health; little or no blood is seen in them, but they contain a large quantity of air, which makes them crackle when pressed.

The treatment of broken wind is very unsatisfactory; and we can only hope for mitigation of the symptoms by keeping the alimentary canal in proper order, administering occasional purgatives, and feeding on a proper quantity of the best oats, which should always be bruised; also by allowing the horse the best hay in spare quantities—viz. from 10 to 12 lb. daily. We may say that broken wind is incurable; and horses very frequently drop down exhausted when at hard work, and die either from congestion of the lungs, hemorrhage, or simple suffocation.

Broken wind is so bad a form of unsoundness, that horse-dealers sometimes attempt, and even successfully, to hide the defect at the time of the sale, and this they do by causing the animal to swallow *shot* or *grease*. A certain portion of lead weighing in the stomach has a wonderful effect in diminishing the symptoms, which become again obvious enough a few hours after the ruse has been practised on some unwary purchaser.

Broker. an agent employed to make bargains and contracts between other persons, in matters of commerce, for a compensation commonly called brokerage. A broker usually confines his attention to one particular market, as wool, sugar, or iron, and the special knowledge he thus acquires renders his services useful to the general merchant, who has no such intimate acquaintance with the trade. The broker is strictly a middle-man, or intermediate negotiator between the parties, finding buyers or sellers as required. He does not act in his own name, nor has he generally the custody of the goods in which he deals, thus differing from a factor, and he cannot sell publicly like an auctioneer unless licensed as such. He is treated as the agent of both parties, though primarily he is deemed the agent of the party by whom he is originally employed. Besides ordinary commercial brokers, there are several other sorts, such as Stock-brokers (see STOCK-EXCHANGE), Share-brokers, Ship-brokers, Insurance-brokers, and Bill-brokers (q.v.). Persons who deal in old furniture and sell and distrain furniture for rent are also called brokers, although differing entirely in their occupations from the preceding commercial agents. The business of a Pawnbroker (q.v.) is also of a different nature.

Brokers in London were formerly admitted by the lord mayor and aldermen, paying £5 on admission, and a like sum annually, under a penalty of £100. They were termed sworn or licensed brokers, and a list was kept by the city of brokers admitted, and of those who had been convicted of fraud or disqualified (33 and 34 Viet. chap. 60). The corporation has ceased to grant licenses or exact fees.

By the Larceny Consolidation Act, 24 and 25 Viet. chap. 96, sect. 76, it is enacted that any person who, being a banker, merchant, broker, attorney, or agent, and being intrusted for safe custody with the property of any other persons, shall in any manner convert or appropriate it to his own use, shall be guilty of a misdemeanour, and be liable to be kept in penal servitude from five to seven years, or to suffer some other punishment, by imprisonment for not more than two years, with hard labour or confinement. See FACTOR.

Brokerage is the remuneration or compensation allowed to a Broker (q.v.).

Bromberg, a town in the Prussian province of Posen, on the Brahe, 6 miles from its influx to the Vistula, and 99 miles SSW. of Danzig by rail. It has iron-foundries, machine-shops, and manufactures of cloth and paper, distilleries, breweries, and corn-mills. There is a considerable provincial trade both by shipping and railway. The *Brom-*

berg Canal, 17 miles long, by uniting the rivers Netz and Brahe, connects the Oder and Elbe with the Vistula. Pop. (1843) 8878; (1890) 41,390.

Brome, RICHARD, a minor dramatist, of whose life but little is known save that he was of humble origin, having been in his earlier days servant to Ben Jonson, that he lived in familiar friendship with Dekker, Ford, and Shirley, wrote as many as twenty-four popular plays, was a devout believer, though a hater of Presbyterians and Puritans, and died about 1652. His best plays are *The Northern Lass*, a comedy, written mostly in prose, and *The Jovial Crew*. The revival of the latter in 1819 delighted Charles Lamb, who speaks with enthusiastic warmth of this 'protest in favour of air, and clear liberty, and honest license, and blameless assertion of man's original blest charter of blue skies, and vagrancy, and nothing-to-do.' Other plays are *The Lancashire Witches*, written in collaboration with Heywood, *The Court Beggar*, and *The Queen and Concubine*. Brome was a poor poet, and the lyrics interspersed in the plays are very indifferent verse; some fair lines of his in memory of Fletcher are in the 1647 folio of Beaumont and Fletcher. Brome's dramatic works were reprinted in 3 vols. in 1873. See vol. ii. of Ward's *History of English Dramatic Literature* (1875).

Brome-grass (*Bromus*; Gr. *bromos*, 'a kind of oat'), a genus of grasses, very nearly allied to Fescue (q.v.). The species are numerous, and some of them are very common British grasses—none more so than the Soft Brome (*B. mollis*), an annual or biennial, which has very soft downy leaves, grows well on poor soils, and is readily

Brome-grass.

eaten by cattle, but is not much esteemed by farmers, either for the quantity or quality of fodder which it yields. The seeds of some species are unwholesome. *B. secalinus* (rye brome-grass) is a troublesome weed, especially in rye-fields, whence the legends of the transmutations of rye into brome through supernatural agencies. See GRASSES, and PASTURE.

Bromeliaceæ, an order of monocotyledonous plants, allied to Amaryllidaceæ and Iridaceæ, and of course to Liliaceæ (q.v.), of which, in the larger sense, many systematists reckon all these mere suborders. They most resemble Amaryllidaceæ (with which they are practically continuous through *Agave*), but are usually distinguished by their

perianth-whorls differentiated as calyx and corolla, and by their habit. They are usually short stemmed, with close-set long rigid leaves, often spiny or scaly, channelled and sheathing at the base. The species are all natives of the warmer parts of America, although some of them are now naturalised both in Asia and Africa. The best-known plant of the order, and the only one much valued for its fruit, is the Pine-apple (q.v.). Some species, with their strong spiny leaves, form impenetrable thickets. Many of them are epiphytic, or grow upon trees without being parasites, and are often called air-plants. *Tillandsia usneoides*, Beard Moss or Spaniards' Beard of the West Indies and of the southern parts of the United States and Mexico, hangs from the trees like the lichens of colder climates, and gives the foliage of the cypress-groves, where it occurs, a peculiar and melancholy picturesqueness. Many species are known in cultivation, and grown suspended from balconies in South America, or greenhouse roofs in this country, chiefly on account of their peculiar mode of vegetation, sometimes although their flowers are often beautiful and fragrant. Many species are also cultivated as ornamental stove-plants. Species of this order also furnish valuable fibres. *Tillandsia usneoides*, already mentioned, yields a fibre, easily obtained and in great abundance, which is used instead of hair for stuffing mattresses. The fibres of the leaves of the pine-apple, and of some other species of this order, have been made into fabrics resembling the finest white muslin, whilst they are found also to possess sufficient strength for cordage. The produce of different species of *Bromelia* is often included along with that of the American Aloe or *Agave* (q.v.), under the name of *Pita* fibre or *Pita* flax, the appearance and properties of the fibres being very similar, as well as those also of the fibres of the species of *Yucca*. The fibre of the pine-apple is, in some countries, very frequently twisted into fishing-lines, and made into nets and into ropes intended for immersion in water, being very little liable to injury from this cause.—The pine-apple cloth of the Philippines, called *Pina muslin* and *Batiste d'ananas*, also sometimes erroneously called *grass-cloth*, from which it may be distinguished by its untwisted fibres (see *BEHMERIA*), is obtained from small-fruited varieties of this and allied species—e.g. *Billbergia ovata*.—The fruit of *B. pinguin*, the Wild Ananas of the West Indies, affords a beverage employed in various ailments.

Bromic Acid, HBrO_3 , is the best-known compound of bromine and oxygen. It is prepared pure by acting on bromine, Br , with bromate of silver, AgBrO_3 , when bromide of silver and bromic acid are produced. Bromic acid is a very unstable acid, being readily decomposed by reducing agents. It forms a whole series of salts called Bromates, none of which are of importance. They are mostly crystalline, but their watery solutions readily decompose when evaporated. When heated, they liberate oxygen and form bromides (see *BROMINE*). Mixed with sulphur or charcoal, they explode by percussion, and in this and other properties resemble the chlorates. See *CHLORIC ACID*.

Bromine (Gr. *bromos*, 'disagreeable smell'; sym. Br ; atomic weight, 80), one of the elements, occurs in combination in sea-water to the extent of about 1 grain to the gallon. It is found more abundantly in certain saline springs, especially those at Krenznach and Kissingen in Germany. It is also present in marine and land plants and animals. In the extraction of bromine from concentrated sea-water, from which common salt has been separated in quantity, and which is then called *Bittern* (q.v.), or from salt springs, the liquor—which contains the bromine, as bromide

of magnesium, MgBr_2 —has a stream of chlorine gas, Cl , passed through it, which forms chloride of magnesium, MgCl_2 , and liberates the bromine. The liquid thus becomes of a more or less yellow tint, and if it be then agitated with ether, and allowed to settle, the latter floats up the bromine. The ethereal solution is then treated with potash, which principally forms bromide of potassium, KBr , and fixes the bromine, so that the ether may be distilled off. The residue is then treated with oxide of manganese and sulphuric acid in a retort with heat, which results in the liberation and distillation of pure bromine. Bromine is a deep red liquid of density 2.98 at 59° (15°C.), which readily evolves red fumes of a very irritating and suffocating nature. It is very poisonous, acting by destroying the animal tissues. When even a little of its vapour is inhaled, there is danger of spasm of the glottis and consequent suffocation. In medicine it has been found of service internally in scrofulous diseases, and as an application to ulcers or in hospital gangrene. It is sparingly soluble in water, more so in alcohol and ether, and its watery solution possesses great bleaching properties. When raised to the temperature of 145.4° (63°C.) it boils, and when reduced to 9.5° (-12.5°C.) it becomes a red crystalline solid. Treated with sulphuretted hydrogen, bromine yields hydrobromic acid, HBr , which is the analogue of hydrochloric acid, as bromine is of chlorine.

Bromides.—Bromine combines very rapidly with most of the metals, occasionally so as to cause ignition, as in the case of antimony, and forms a class of salts usually known as bromides, though perhaps they are rather hydrobromides (see *HYDROBROMIC ACID*). Bromide of silver, which is very sensitive to the sun's rays, is used in photography. Bromide of potassium, which is the most important of the bromides, may be prepared by the action of bromine on solution of caustic potash. The whole is then evaporated to dryness, and ignited along with charcoal. On solution in water and crystallisation, the bromide is obtained in colourless, cubical crystals, possessing a pungent saline taste, and which are very soluble in water. This salt has been used in a very large number of diseases, owing to its powerful sedative properties. Other bromides (such as those of sodium and lithium) are of comparatively little importance, although they possess similar medicinal properties. Hydrobromic acid combines with these the tonic effects of hydrochloric acid. In epilepsy, bromide of potassium affords marked relief. As a sedative in nervous excitement and sleeplessness, its use produces beneficial results, while in delirium tremens and tetanus large doses give relief. In excessively large doses, general depression, lowering of the temperature, and even death may result. And it should be known and remembered that the administration of bromine compounds in large doses and for long periods often leads to unpleasant effects, collectively termed *bromism*. The earliest and most common are skin eruptions, resembling Acne (q.v.) or boils; the further results are due to diminished activity of the nervous system—viz. lassitude, low spirits, weakened brain power, &c. All these symptoms soon disappear when the use of the drug is discontinued.

Bromley, a market-town of Kent, on the Ravensbourne, 10 miles SE. of London. Long the residence of the bishops of Rochester, it has a town-hall (1864), a college for clergymen's widows (1866), and a church, with the grave of Dr Johnson's wife. Pop. of parish (1851) 4127; (1891) 21,684.

Brompton is a district of London in the parish of Kensington, SW. Part of what was once Brompton is now known as South Kensington.

Brompton, once specially a quarter for artists, contains a fine consumption hospital and the Oratory (q.v.).

Bromsebro, a village and castle of Sweden, 27 miles S. of Kalmar. Treaties were signed here between Sweden and Denmark in 1541, 1641, and 1645.

Bromsgrove, a market-town of Worcester-shire, near the small river Salwarp, 12 miles NNE. of Worcester, and $\frac{1}{2}$ mile from a station on the Birmingham and Gloucester Railway. Situated in a richly wooded valley, it has a principal street a mile in length, a grammar-school (1553; re-founded 1693), and a fine old church, restored by Sir Gilbert Scott in 1858, with a spire 189 feet high, and monuments of the Talbots. The linen manufacture has been superseded by nail and button making. Pop. (1851) 4426; (1891) 7934.

Bromwich. See WEST BROMWICH.

Bronchi are the subdivisions of the trachea or windpipe. Opposite the third dorsal vertebra, the windpipe divides into two branches or bronchi, of similar structure to itself—namely, round and cartilaginous in front; and flat, with muscular and fibrous tissue behind, lined with mucous membrane. Of these bronchi, one goes to each lung, the right being little more than an inch; the left, about two inches in length. On entering the substance of the lung, the bronchi divide into smaller branches, which again subdivide, until they are no larger in diameter than $\frac{1}{16}$ th to $\frac{1}{32}$ th of an inch, and give origin to, or terminate in, small polyhedral sacs, which seem to cluster round their extremities, and open into them. These are the *air-cells*; they consist of elastic tissue, with a lining of mucous membrane, and beneath the latter, a layer of minute blood-vessels of the lung. See LUNGS, RESPIRATION.

Bronchitis, or inflammation of the lining membrane of the bronchial tubes, is a disease of very common occurrence in Great Britain and in the United States, and one of the greatest importance, for, though in most cases completely recovered from, it may, if carelessly treated, lead to premature and miserable old age, or even in some cases to speedy death. Moreover, besides occurring independently, it is an extremely common complication in other diseases—e.g. in fevers, and in affections of the heart or kidney. It is usually caused by exposure to cold; but persons whose occupations expose them to the constant inhalation of irritating dust (masons, needle-grinders, and many others), often suffer from a form of bronchitis which is extremely apt to lead to disease of the lungs. The first symptoms of acute bronchitis are generally those which distinguish a common cold—viz. shivering, headache, and sense of weariness, with occasional cough; but the cough continues, and recurs in paroxysms; there is a feeling of oppression on the chest and pain behind the breastbone on coughing, and the person *wheezes* when he breathes. He also breathes more rapidly, six or ten respirations in the minute more than he did when in health, his pulse is quicker, and his temperature a little above normal; and the ear applied to his chest, after these symptoms have continued for two or three days, will hear a rattling, as if air was bubbling through thickish fluid, which indeed is the case; he is breathing through an extraordinary amount of mucus secreted by the inflamed lining membrane of the tubes. During his paroxysms of cough, this mucus is spit up. If the inflammation extend no further than the larger bronchial tubes, it is termed *tubular* bronchitis, and is seldom a fatal disease in the first attack. When the minute ramifications of the bronchial tubes are chiefly or alone affected, either from the

first or by downward extension of the inflammation, the danger to life is very great; this form is called *capillary* bronchitis, and is most often seen in children, though happily less frequently than tubular bronchitis. In such a case, the cough and associated pain may be less severe, but all the other symptoms—feverishness, distress, prostration, &c.—are much more intense than in the milder form. The breathing may be so embarrassed that the patient can no longer lie down, but requires to sit or stand up, and use all his muscles of respiration. Though he coughs, he spits very little, till about the third day, when he expectorates large quantities of yellow fluid. At last, prostration becomes so complete that he ceases to spit, and dies suffocated by the accumulated mucus, from the fifth to the seventh day.

A patient who has once had acute bronchitis is very apt to suffer from it again, and after one or many attacks the disease may become chronic. *Chronic* bronchitis leads to important structural changes in the lungs, especially Emphysema (q.v.), to consequent embarrassment of the respiration and circulation, with secondary changes in other organs, and is generally fatal, though, it may be, not for many years. The patient is always liable to severer attacks, much resembling acute bronchitis, and often induced by very slight causes.

The treatment of bronchitis must vary with the patient's constitution; but in most cases, counter-irritation, applied through the medium of mustard or hot turpentine fomentations, will be found very useful. These remedies act more rapidly than a blister, and may be frequently repeated. It is of the greatest importance that the patient should remain in a warm, equable, and moist atmosphere. In the early stages, before free expectoration is established, *ipeacacuanha* is generally the most useful remedy; but it should be remembered that patients suffering from bronchitis are very easily depressed, especially after the first few days, and then stimulating expectorants, such as ammonia, squills, balsams, should be added. In very acute cases, after a brisk purge, an emetic is often very useful to remove accumulations of mucus. In some cases of bronchitis, the persistence of the disease depends upon some constitutional weakness (gout, syphilis, &c.); and no treatment will effect a cure unless it include remedies for the particular condition which may be present.

In chronic bronchitis, avoidance of the causes which lead to 'catching cold' is of the utmost importance. Residence during the winter in a mild, equable climate, or confinement to a well-warmed house, is sometimes the only measure that will be of much service. The exacerbations must be treated on the same principles as acute bronchitis. In the bronchitis of old persons, chloric ether will be found very useful, and may be combined with sedatives, as henbane; but opium must be given with great caution, or not at all, as it tends to diminish the expectoration of mucus from inflamed tubes. The paregoric elixir (compound tincture of camphor) is an old and popular remedy in bronchitis, but enough has been said to impress on the reader the danger of tampering with bronchitis. In every case where it is possible, a skilled medical man should be employed, to determine, by the stethoscope, not only the disease but its exact situation and cause; and as it is but too likely to recur at some future period, or symptoms caused by it to appear, a skilled opinion has a permanent value to the patient. See CATARRH.

Bronchocele. See GOITRE.

Bröndsted, PETER OLUF, a Danish archaeologist, born near Horsens, in Jutland, 1780, studied at Copenhagen, where in 1813, after some years

spent in travels and excavations in Italy and Greece, he was appointed extraordinary professor of Philology. Returning to Rome in 1818 as agent of the Danish government, he was enabled to carry on his researches for several years. He died rector of the Copenhagen University in 1842. Brøndsted's principal work is his *Reisen und Untersuchungen in Griechenland* (Stuttgart, 1826-30), of which only 2 vols. were published.

Brongniart, ALEXANDRE, an eminent French scientist, born at Paris, 1770, became in 1797 professor of Natural History at the Ecole des Quatre Nations, and afterwards in the Museum of Natural History. Appointed in 1800 director of the porcelain manufactory at Sèvres, he held that office for the remainder of his life, and revived the almost lost art of painting on glass. In his *Essai d'une Classification des Reptiles* (1805), he proposed the fourfold division of reptiles into Saurians, Batrachians, Chelonians, and Ophidians. His *Traité Élémentaire de Minéralogie*, published in 1807 at the instance of the Imperial University, became a text-book for lecturers. In 1814 appeared his monograph on Trilobites, a name which, as well as a basis of classification for those singular crustacea, naturalists owe to Brongniart. In 1815 he was elected a member of the Academy, and shortly after made a careful study of the geology of Italy and Switzerland, and of Scandinavia. In 1829 he published the *Tableau des Terrains qui composent l'Écorce du Globe*, and in 1835 he collaborated with Cuvier in preparing the admirable *Description Géologique et Minéralogique des Environs de Paris*. In 1845 appeared his *Traité des Arts Céramiques*. He died October 7, 1847.—His son, ADOLPHE THÉODORE, was a botanist of some note. He was born in Paris (1801), in 1833 became professor of Botany at the Jardin des Plantes, and in 1852 was made inspector-general of the Scientific Faculties of France. He died in 1876. His principal work is the *Histoire des Végétaux Fossiles* (2 vols. 1828-47).

Broni, a town of Northern Italy, with mineral springs, 11 miles SE. of Pavia. Near by is the castle of Broni, where Prince Eugène obtained a victory over the French in 1703. Pop. 5147.

Bronn, HEINRICH GEORG, a German naturalist, born at Ziegelhausen, 1800, was educated at Heidelberg, where in 1828 he commenced a course of lectures on natural history and palæontology. In 1833 he was nominated professor of Physics, and was afterwards appointed to the zoological lectureship. In 1834 appeared his most important geological work, *Lethæa Geognostica*; in 1841-49 his *Geschichte der Natur*; and in 1850 his *Allgemeine Zoologie*, which was the first attempt to develop zoology in its entirety with reference to extinct organisms. Bronn died 5th July 1862.

Brontë, a town of Sicily, situated at the western base of Mount Etna, 33 miles NW. of Catania. The lava streams of 1651 and 1843 lie on either side, but the district around is fertile, and produces wine. Lord Nelson was created Duke of Bronte by the Neapolitan government in 1799. Pop. 16,427.

Brontë, CHARLOTTE, one of the most gifted English novelists, was born at Thornton, in Yorkshire, on the 21st April 1816. Her father, originally Patrick Prunty (1777-1861), who was a clergyman, belonged to Ireland; her mother was a native of Cornwall. Her life almost to its close was one of sorrow and struggle. In 1821 the family removed to the parsonage of Haworth, a village situated amid the Yorkshire moors, and in the following year Charlotte's mother died. In her eighth year she was sent to Cowan's Bridge School, the Lowood of which she has given so dark a picture

in *Jane Eyre*. After the deaths of two of her sisters at Cowan's Bridge, Charlotte, whose health had broken down, was taken back to Haworth, and remained there until 1831, when she was sent to a school at Roehead kept by Miss Wooler, with whom she formed a lifelong friendship. Mr Brontë's austere and gloomy nature cast a shadow over his children's lives. His means were narrow, and his daughters, Charlotte, Emily (born 1818), and Anne (born 1820), were forced to seek a livelihood as governesses. To fit themselves for higher educational work, Charlotte and Emily studied at Brussels, where they lived in a *pension* from 1842 to 1844. In 1846 the three sisters published a volume of poems bearing on its title-page the names Currer, Ellis, and Acton Bell—Currer Bell being the pseudonym of Charlotte. The book attracted little notice. Its authors then turned to prose fiction; Charlotte writing *The Professor*; Anne, *Agnes Grey*; and Emily ('Ellis Bell'), the strange, moving romance of *Wuthering Heights*. *The Professor* having been rejected on the score of deficiency in plot-interest, Charlotte set to work upon *Jane Eyre*, which was published in 1847, and gained a great but not an uncontested success. Her sister Emily and her brother Branwell died in 1848, and after the death of Anne, in the following year, Charlotte was left alone with her father in the gloomy Haworth parsonage. A third novel, *Shirley*, appeared in 1849, and in 1852 *Villette*, which was her own favourite book, and which contains in Paul Emmanuel the best character she ever drew, was given to the world. She was married in 1854 to Mr Nicholls, who had been her father's curate at Haworth. Her brief married life was a happy one, though her husband had no sympathy with her in her literary work, which, indeed, he would have preferred her to abandon. A new story, *Emma*, had been begun, however, before her death, which occurred on March 31, 1855. Her life and writings are very closely connected. She is herself the heroine of *Jane Eyre* and of *Villette*, while *Shirley* was intended for the portrait of her sister Emily. Her range was not wide, but in imaginative strength her stories rank with the greatest in literature. Her peculiar power lies in delineating and in suggesting intense passion without having recourse to unusual or exciting situations. Except in part of *Jane Eyre*, where she endeavoured, against the bent of her genius, to construct a sensational plot, her scenes and incidents are those of uneventful, everyday life. Her style, though unequally sustained, is at its best admirably terse and vivid. Emily Brontë revealed in *Wuthering Heights* a genius in some ways higher and finer, though far less mature than Charlotte's. The story is as wild as a dream; but the strange, passionate figures are the creations of a daring and fiery imagination, and the beautiful descriptions of moorland scenery have hardly been surpassed in fiction.

See *The Life of Charlotte Brontë*, by Mrs Gaskell (1857); *A Note on Charlotte Brontë*, by A. C. Swinburne (1877); *Charlotte Brontë, a Monograph*, by Sir W. Reid (1877); Miss Robinson's study on Emily (1883), and Augustine Birrell's on Charlotte (1887); Dr W. Wright, *The Brontës in Ireland* (1893; 2d ed. 1896); the Bibliography published by the Brontë Society (1894); Clement K. Shorter, *Charlotte Brontë and her Circle* (1896).

Bronze is usually defined as an alloy of copper and tin. Neither ancient nor modern bronzes consist always of only these two metals. Zinc, lead, and even silver are often present in Greek and Roman bronze objects, although the general result of an analysis of these shows a composition of from 80 to 90 parts copper to 10 or 12 of tin. Some of the fine French bronze statues of the time of the Renaissance are made of an alloy of nearly this composition—copper 92, tin 2, zinc 5, lead 1. Much of our

modern statuary consists of bronze varying from 10 parts copper to 1 of tin—a proportion recommended by Sir H. Davy—to 8 parts copper plus 2 of tin. Some zinc or lead, or both, as well as other metals, are occasionally substituted for part of the tin.

Mr W. Graham has classified the alloys of copper and tin in this way: 12 to 20 parts copper with 1 of tin yield red-coloured alloys; 5 to 10 parts copper with one of tin yield alloys of strength; 2 to 4 parts copper with 1 of tin yield alloys of sound (bell-metal); $\frac{1}{2}$ to 1 part copper with 1 of tin yield alloys of reflection (speculum metal). The alloys of strength here referred to include the bronze used for statues, and also that, sometimes called gun-metal, employed for bearings and other parts of machinery, as well as the alloys of which cannon are, or perhaps we should rather say were, made. A good deal of the bronze for all three purposes is very similar in composition.

A bulky and valuable volume of reports on the strength and other properties of metals for cannon, by officers of the Ordnance Department of the United States Army, published in 1856 (H. C. Baird, Philadelphia), contains a section on the manufacture of bronze guns. The bronze used in casting the various guns tested was of the same composition—namely, copper 8 parts, tin 1 part. It had a mean density of 8.519, and an average tenacity of 27,793 lb. per square inch. It is clearly seen by the results of these experiments, that bronze made of the same mixture may vary considerably in its quality. The report states that 'the same kind of copper, and of tin, mixed in the same proportions, and melted in like manner, was used in all the castings; yet the table exhibits a remarkable diversity in the results.'

General Uchatius (1811-81) of Vienna devised a plan of hardening Austrian bronze guns by forcing hardened steel pistons into them. The metal is then called *steel bronze*.

Alloys of copper, tin, and zinc, employed for parts of engines and other machinery, are frequently called brass, as well as gun-metal, and are referred to under the head BRASS; and see ALUMINIUM.

History.—The brass referred to in the Bible was no doubt bronze (see BRASS). The Egyptians, Greeks, Etruscans, Romans, and other ancient nations, employed bronze not only for art objects pure and simple, but for a great number of useful articles, very many of these, however, being artistically decorated. The magnificent collection of bronzes in the National Museum at Naples shows, almost at a glance, how extensive was the use of this alloy for articles of daily and domestic use. It is believed that both the Greeks and Romans, for such objects as swords, spears, saws, razors, and other tools, were able to make an alloy of copper and tin which surpassed modern bronze in some properties, and that they possessed some method of tempering bronze, the secret of which has been lost. See BED, LAMP, MIRROR, SCULPTURE, SWORD, and VASE.

Reference is made in the next article to the use of bronze in northern countries in prehistoric times during the Bronze Age. Bronze has been used from early times for statues and statuettes, chiefly representations of deities, as well as for ornamental purposes, in India and China. The Japanese, who are very clever workers in inlaid metals, make bronze of several colours, such as black, blue, purple, and green. These are all different mixtures.

Phosphor-bronze.—It is difficult to make ordinary bronze a quite homogeneous compound. An alloy more perfect in this respect is formed when copper is mixed with tin phosphide instead of metallic tin. The phosphorus, which is added to the extent of from 0.25 to 2.5 per cent., makes the bronze harder, more elastic, and of greater tenacity. This alloy

suits best for machinery purposes, for which it is now largely employed, when the proportion of tin is from 7 to 8 per cent. Phosphor-bronze is used for bearings of shafts, piston-rings, pump-rods, propellers, boiler-fittings, and other parts of engineering work. Ornamental castings are also made of it. See CAST, FOUNDED, and BRASS.

Bronze Age, a term in prehistoric archaeology, denoting the condition or stage of culture of a

Fig. 1.—Bronze Axes :
a, flat, 16 $\frac{1}{2}$ inches in length; b, flanged, 6 inches; c, socketed, 5 $\frac{1}{2}$ inches.

people using bronze as the material for cutting-implements and weapons. As a stage of culture, it comes in between the use of stone and the use of iron for these purposes. It is not an absolute

division of time, but a relative condition of culture, which in some areas may have been reached earlier, in others later, while in some it may have been prolonged, and in others brief, or even, as in the Polynesian area, it may have been non-existent in consequence of the people passing directly from the use of stone to that of iron. A bronze-age people in one region may thus have been contemporary with a stone-age people in another, and with an iron-age people in a third; that is to say, the succession of the three ages was not necessarily synchronous, either in contiguous or in widely separated areas. The Homeric poems depict the culture of a people passing from the use of bronze to that of iron. The Mexicans and Peruvians, on the other hand, were still in their bronze age in recent times. The bronze age of Europe generally is marked by the use of certain forms of implements and weapons, as well as by certain conditions of life and customs of burial, which differed from those of the preceding age of stone and of the succeeding age of iron. The implements and weapons of the bronze age include knives, saws, sickles, awls, gonges, hammers, anvils, axes (fig. 1), swords, daggers (fig. 2), spears (fig. 3), arrows, shields (fig. 4). The forms of each class differ in different areas, and vary with advancing time. Blades and axes,

Fig. 2.
a, Bronze sword found in Edinburgh, 20 inches in length; b, Danish bronze dagger, 13 inches in length.

which were at first made with tangs to be inserted in the handles, became socketed for the insertion of the handles; and articles which it was at first the custom to finish in the mould were finished with the hammer, and shields, and vessels made of hammered

Fig. 3.

plates were ornamented with chasing and repoussé work. The ornamentation of the bronze age consists chiefly of concentric circles, spirals, and bosses. The workmanship is always of a very high order, the shapes graceful, and the finish fine. The moulds used for casting were of stone, or bronze, or clay. The system of coring was carried to great

Fig. 4.

Bronze shield (a, front; b, back view), 13½ inches in diameter.

perfection, and many of the more difficult castings were turned out in a manner that would do credit to the most expert of modern workmen. The composition of the bronze varied considerably, but may be stated in general as about 90 per cent. of copper to 10 per cent. of tin. See Evans's *Bronze Implements of Great Britain*; Chantre's *Age du Bronze en France*; Anderson's *Scotland in Pagan Times* (2d series, *The Bronze and Stone Ages*, 1886); and works named under ARCHEOLOGY.

Bronze-wing and Bronze Pigeon, names given in the Australian colonies to certain kinds of wild pigeon, on account of the lustrous bronze colour with which their wings are variously marked. In other respects also they are beautiful birds. —The Common Bronze-wing or Bronze-winged Ground Dove (*Phaps chalcoptera*) is distributed over all the Australian colonies. It is often seen in flocks, feeds on the ground, and builds its nest chiefly on low branches of trees growing on meadow-lands or near water. It often flies long distances to water, and may be followed as a guide. It is a plump bird, often weighing fully a pound, and is acceptable at every table. —The

Brush Bronze-wing or Little Bronze Pigeon (*P. elegans*) is not so plentiful nor so widely distributed, found chiefly in Tasmania and the southern parts of Australia. It inhabits low swampy grounds, never perches on trees, resembles a partridge in its habits, and makes a loud burring noise like a partridge when it takes wing on being alarmed. —The Harlequin Bronze-wing (*P. histrionica*) is found in the north-western parts of New South Wales in great flocks, feeding on seeds. —Some of the species of *Ocyphaps*, another of the genera or sub-genera of the Columbidae, are also sometimes called Bronze-wing. Their partridge-like appearance and habits have gained for them the name of Partridge Pigeon (see PIGEON, COLUMBIDÆ).

Bronzing. An imitation of bronze may be produced on the surface of other alloys and metals either by corrosive chemical solutions, which is the most efficient way, or by coating them with varnish and bronze powder. In most large towns bronzing-liquor for brass and zinc can be purchased where chemicals are sold. Bronzing is very largely applied to brass-works of various kinds, and especially to gas-fittings. For this purpose the following solutions are used, but the brass is first pickled with nitric acid and scoured with sand and water, or it may be treated with a potash solution.

For dark olive-green bronze, muriatic acid and arsenic; sometimes iron scales are added. Afterwards brush with black lead and coat with yellow lacquer. For steel-gray bronze, boiling solution of chloride of arsenic. For brown bronze, solution of the nitrate or perchloride of iron. For black bronze, solution of the chloride of platinum. To produce on new bronze an imitation of the patina on an antique bronze, a mixture in hot water of sal-ammoniac, cream of tartar, common salt, and nitrate of copper is used. Salt of sorrel, sal-ammoniac, and vinegar is another mixture employed.

Iron castings are very effectively bronzed by covering them with an electro deposit of copper in the form of a thin film or layer, which can then be darkened by any of the chemical bronzing solutions, and either lacquered or varnished. The copper surface is often simply varnished. Many beautiful foreign statuettes in zinc are also bronzed in this way. See ELECTRO-METALLURGY.

A brown colour, sometimes called a *bronzing*, is given to the surface of iron and steel objects by a concentrated solution of trichloride of antimony (*liquid butter of antimony*), having a specific gravity of 1.35. This has been a good deal used for gun barrels.

Coating with Gold or Bronze Powders.—Metal, wood, plaster of Paris, and other materials can be coated with these in the form of a paint. Doors, friezes, cornices, and other parts of rooms are now frequently bronzed in this way. When bronze powder is used, the wood or plaster first receives three or four coats of yellow oil paint, then two coats of a mixture of the bronze powder with flat varnish, and finally this is covered with another layer of varnish. If it is desired to give an object with bas-reliefs or other raised ornaments the appearance of a bronze, changed more or less to green by time and exposure, perhaps the most tasteful way is to partially gild the projecting portions and paint the rest of the surface of a sombre green, running the colour partly over the gold.

Bronzite, silicate of magnesia and ferrous oxide, a rock-forming mineral belonging to the Pyroxene group (q.v.).

Brooch (from a root signifying to pierce; comp. Eng. *to broach*; Fr. *brocher*, 'to spit,' or 'to stitch'; Wel. *proc*, 'to stab'), an ornamental pin or instrument for fastening the dress, consisting for the most

part either of a ring or disc, or of a semicircle, there being a pin in either case passing across it, fastened at one end with a joint or loop, and at the other with a hook. The oldest known brooches are those found in graves assigned to the early iron age of Southern Europe. They are made of bronze, and consist of a bent or bow-shaped body, with a spring pin coming from a spiral twist at one end, and its point fitting into a loop of the bow at the other end, like the modern 'safety' shawl-pin. They are exceedingly varied in form, often presenting grotesque imitations of the shapes of animals. The form which prevailed in Northern Europe was more massive, having a cross-bar at one end, and covered with chased ornamentation inlaid with gold. In Scandinavia a peculiar form of brooch of brass of oval bowl-shape, covered with dragoesque ornamentation, plated with gold and studded with bosses and coloured pastes, was characteristic of the Viking period. The early Celtic brooches of Scotland and Ireland were penannular, the ring being incomplete, with expanded ends, while the pin, which was loosely looped upon the ring, was greatly longer than the diameter of the brooch. They were made of bronze or silver plated with gold; the flat ring, divided into panels, was richly ornamented with interlaced or spiral patterns, or dragoesque filigree work, peculiar to Celtic art, and studded with settings of amber or coloured glass. The most elaborate work of art of this description is the Tara Brooch, preserved in the museum of the Royal Irish Academy at Dublin, of which a woodcut is subjoined. The finest in

The Tara Brooch.

Scotland is the so-called Hunterston Brooch, which was found in 1830, on the estate of Hunterston, in the parish of West Kilbride, Ayrshire. It is of silver, richly ornamented with gold filigree, elaborately worked into lacertine and ribbon patterns, and set with ornaments of amber; diameter, $4\frac{1}{8}$ inches. On the reverse is an inscription scratched in runes: 'Maelbritha owns this brooch.' The later form of the Highland brooch of brass or silver is annular, having a pin of the length of the diameter of the ring. Those of brass are decorated with chased

patterns of interlaced work, scrolls of foliage, and grotesque animals. Those of silver have their decoration often inlaid with niello, and sometimes enriched with settings. The Ugdale Brooch, in

Brooch of Ugdale.

the possession of Hector Macneal of Ugdale, in Kintyre, which is here figured, is a characteristic example of a form of reliquary brooch of West Highland origin. The Brooch of Lorn, in the possession of Macdougall of Dunolly, near Oban, has the reputation of being identical with one torn from the breast of Robert Bruce by Alexander of Lorn, the ancestor of Macdougall, in a personal contest with the king, but it is also identical in form and character with the Lochbuy Brooch, now in the British Museum, and classed as a work of the 16th century. They are all about $4\frac{1}{2}$ inches in diameter, having a circle of jewelled obelisks rising round a central capsule, crowned by a large rock-crystal. The capsule is removable, and discloses a cavity, designed, doubtless, for the purpose of a reliquary.

Brooke, HENRY, dramatist and novelist, was born in the year 1708, at Rantavan, County Cavan, Ireland, the son of a wealthy clergyman. In 1720 he entered Trinity College, Dublin, and in 1724 went to study law in London, where he became the chosen friend of Pope and Lyttelton. From the heart of this brilliant literary society he was recalled to Ireland by a dying aunt, who left him guardian of her child, a girl of twelve, whom he afterwards married. His poem, *Universal Beauty* (1735), is supposed to have supplied the foundation for Erasmus Darwin's *Botanic Garden*. In 1739 he published his play, *Gustavus Vasa*, full of the noblest sentiments and the most inconceivable characters, the acting of which was prohibited at Drury Lane; Dr Johnson writing a satire in vindication of the licensers of the stage. It was afterwards produced in Dublin as the *Patriot*. In 1740 Brooke was taken ill, and returned finally to his native country, where he published several books. He died at Dublin, in a state of mental debility, 10th October 1783. The sonorous eloquence of his plays has not saved them from oblivion; and his novel, *The Fool of Quality*, is the sole survivor of his numerous works. It is distinguished by humour, close observation, simplicity of style, and a religious and philanthropic tone that highly commended it to John Wesley. A new edition was published in 1859, with a preface by Kingsley, who considered that the reader, in spite of the defects of the book, would learn more from it of what was pure, sacred, and eternal, than from any book since Spenser's *Faerie Queene*.

Brooke, SIR JAMES, rajah of Sarawak, in Borneo, and governor of Labuan—a man strongly

imbued with the spirit of the old adventurers of the Elizabethan time—was born at Benares, 29th April 1803, and educated at Norwich. He entered the East India army (1819), was seriously wounded in the Burmese war, and returned home on furlough (1826). The voyage out to join his regiment was so protracted that he was unable to reach India before his furlough had expired; his appointments consequently lapsed, and he quitted the service in 1830 and returned to England. He now conceived the idea of putting down piracy in the Eastern Archipelago, and of carrying civilisation to the savages inhabiting these islands. He purchased a small brig and made a voyage to China. On his father's death (1835) he inherited £30,000, and after a cruise in the Mediterranean, sailed in a schooner-yacht from London for Sarawak, a province on the north-west coast of Borneo, in 1838. When he arrived there (1839), the uncle of the sultan of Borneo was engaged in a war with some rebel tribes. Brooke lent his assistance, and in return had the title of Rajah and Governor of Sarawak conferred upon him, 24th September 1841, the native governor being forced to resign. Brooke immediately set about reforming the government, instituted free trade, and framed a new code of laws. The murderous custom of head-hunting, prevalent among the Dyaks, he declared to be a crime punishable with death, and vigorously set about the extirpation of piracy. Revisiting England in 1847, he received a warm welcome, and was invited by the Queen to Windsor. He was created a K.C.B. in the year following; and the island of Labuan, near Sarawak, having been purchased by the British government, he was appointed governor and commander-in-chief, and British commissioner and consul-general in Borneo. Certain charges brought in 1851 against Brooke in the House of Commons in connection with the receipt of 'head-money' for the slain pirates, were declared by a Royal Commission to be unsubstantiated; the 'head-money' was received, not by Brooke and his associates, but by the British ships-of-war that had co-operated with him. In 1857 Brooke, who had been superseded in the governorship of Labuan, but who still acted as rajah of Sarawak for the sultan of Borneo, was attacked at night in his house by a large body of Chinese, who were irritated at his efforts to prevent opium-smuggling. The Chinese committed great havoc on his property, but Brooke soon collected a force of natives, attacked the Chinese, and defeated them in several successive fights. He was in England in 1858, returned to Borneo in 1861, and visited England again twice before his death. He had the satisfaction of seeing the independence of Sarawak recognised by the English government. The country prospered greatly under his régime; he found the chief town a place of some 1000 inhabitants, he left it a town of 25,000; and the exports to Singapore, which in 1840 amounted to £25,000, were in 1858, £300,000. Brooke died at Burrator, in Devonshire, 11th June 1868, and was succeeded at Sarawak by his nephew. See SARAWAK; also *Letters of Sir James Brooke* (1853), *Jacob's Raja of Sarawak* (1876), *St John's Life of Sir James Brooke* (1879).

Brooke, STOPFORD AUGUSTUS, writer and preacher, was born in Letterkenny, Donegal, in 1832. After a brilliant course at Trinity College, Dublin, he took orders, and after holding various curacies, was incumbent of St James's Chapel from 1866 to 1875, thereafter of Bedford Chapel, Bloomsbury, where his sermons, at once rich in thought and graceful in literary form, made him one of the chief preachers in London. In 1872 he was appointed chaplain-in-ordinary to the Queen. In

1880, through a conscientious inability any longer to believe in miracles, he seceded from the Church of England, but continued to preach in his proprietary chapel in Bloomsbury. Brooke showed fine literary sense and spiritual sympathy in his *Life of Frederick Robertson of Brighton* (1865); and his reputation did not suffer by his *Theology in the English Poets* (1874), *Primer of English Literature*, and *Milton* (1876), and six volumes of *Sermons* (1868-88).

Brook Farm, a community on Fourier's principles, 8 miles SW. of Boston, organised in 1840 by George Ripley, and largely an outcome of the Transcendental movement of the time. Here, on an estate of 200 acres, a company of scholars and educated men and women settled down to a communistic experiment, in which every member should do his share of the necessary manual work. The phalanstery, 175 feet long and three stories high, was burned down before it was occupied; and the attempt ended in hopeless failure. Hawthorne was one of the founders, and lived for some months on the farm, in which he invested all his savings; a charming memorial of this singular enterprise is his *Blithedale Romance*.

Brooklime (*Veronica Beccabunga*), a species of speedwell, having a superficial resemblance to watercresses, which it also slightly resembles in taste, if not also in anti-scorbutic properties, abundant in ditches, watercourses, and wet places near springs in Britain, and common throughout the paleartic region. See SPEEDWELL.

Brookline, a suburban town, about 4 miles SW. of Boston, U.S., by rail or tramway, with numerous handsome villas and parks, and manufacturing of philosophical instruments, &c. Pop. (1885) 9196; (1891) 12,193.

Brooklyn, the fourth city of the United States, and capital of King's county, New York, is situated on the west end of Long Island, opposite New York City, from which it is separated by a strait called East River, nearly a mile in width, running from Long Island Sound to New York Bay. Twelve or more lines of steam-ferries ply between the different points of Brooklyn and New York, and a magnificent suspension bridge (finished 1883), 5989 feet in length by 85 in breadth, and with a river span of 1595½ feet, intended for foot-passage, carriages, and railways, extends from one city to the other (see BRIDGE). Branches of the Long Island system of railways have their west terminus in Brooklyn, running thence to Greenport and Sag Harbour near the east end of the island, and five or more lines connect this city with Coney Island, a famous bathing-place 10 miles distant. Two lines of steam elevated railways and numerous lines of horse-cars traverse the streets of Brooklyn, making easy communication between the suburban sections and the ferries. Although not a port of entry, the amount of foreign and domestic freight that comes to its warehouses is enormous. Freight-cars are brought to its docks on floats, and great numbers of canal-boats from the interior discharge their cargoes here. Some of these docks are among the most extensive works of the kind in the United States, covering from 40 to 60 acres each, and are lined with immense storehouses for grain and other freight.

At the south-east extremity of the city, upon a high ridge overlooking New York Bay and its environs, is the beautiful Greenwood Cemetery, covering about 400 acres, and containing many fine monuments; and near at hand are the Ridgewood reservoir and Prospect Park, a public pleasure-ground of 540 acres, which has cost, including two noble boulevards connected with it, extending

Copyright 1888 in U.S.

Company.

respectively 3 and $2\frac{1}{2}$ miles to Coney Island and East New York, nearly \$12,000,000. The city proper has a water front of 10 miles, and within its

It is divided into 26 wards, and according to the census of 1890 was the fourth city in population in the United States. The population in 1810 was 4402; in 1830, 15,396; in 1850, 96,838; in 1870, 396,099; in 1880, 566,603; and in 1890, 806,343.

Brooklyn Suspension Bridge.

area of 25 sq. m. are carried on large and varied industries, among which are embraced the refining of sugar and petroleum, the manufacture of glass, chandlery, clothing, carpets, chemicals, paints, oil-cloth, metallic wares, tobacco, steam-boilers, lace, hats, buttons, paper, felt goods, &c., and the building and repairing of ships.

Brooklyn has 13 national banks, 14 savings-banks (2 of which have deposits of \$22,000,000 each), 8 daily, 2 weekly, and many monthly periodicals. Its school system embraces a high school, a training school for the public school teachers, 70 grammar and primary schools (employing 1817 teachers, and costing \$1,800,000 annually), 2 medical colleges, a Roman Catholic college, and numerous convents, academies, and seminaries, attended by about 60,000 pupils. An average of 75,000 children attend the public schools daily. Brooklyn is 'the City of Churches': of such edifices there are 58 Methodist, 54 Roman Catholic, 39 Protestant Episcopal, 32 Baptist, 25 Congregational, 24 Presbyterian, 21 Lutheran, 16 Dutch Reformed, 9 Jewish, &c. The public buildings are not generally imposing: among the most notable are the court-house, erected at a cost of \$543,000; the hall of records, costing \$328,000; the municipal building, costing \$200,000; an academy of music, with a seating capacity of 2400, &c. Its charitable institutions comprise lunatic and deaf-mute asylums, homes for destitute children, for the aged, the idiotic, and the deformed, and numerous pharmacies, dispensaries, infirmaries, hospitals, &c. There is a fine government post-office, and a United States navy yard, which occupies about 40 acres of ground, with extensive ship-houses, workshops, and military stores, and a dry-dock which cost about \$1,000,000.

First settled in 1636, the town was organised by the Dutch governor of New Amsterdam in 1646, and named Breukelen from a place of the same name in the Netherlands, 8 miles NW. of Utrecht. It was incorporated as a city in 1834, to which Williamsburg (now 'Brooklyn E.D.,' or Eastern District) and Bushwick were added in 1855, and in 1886 the town of New Lots (East New York) was annexed.

Brooks, CHARLES WILLIAM SHIRLEY, editor of *Punch*, was born in London, the son of an architect, 29th April 1816. In 1832 he was articled to an Oswestry attorney, but literature had more charms for him than the law. From clerk he became, like Dickens, a reporter, and settling in London, wrote dramas, contributed to some of the leading periodicals and journals, and for five sessions wrote the Parliamentary Summary for the *Morning Chronicle*. By its proprietors he was sent in 1853 on a mission to report on the con-

dition of labour and the poor in Russia, Syria, and Egypt; and a result of his observations appeared in *The Russians of the South* (1856). In 1851 he formed a connection with *Punch* which lasted during his lifetime. He wrote its 'Essence of Parliament,' and on Mark Lemon's death in 1870 succeeded him as editor. In his novels he showed a thorough knowledge of contemporary life and literature: the chief are *Aspen Court* (1855), *The Gordian Knot* (1860), *The Silver Cord* (1861), and *Sooner or Later* (1868). He died in London, 23d Feb. 1874. His *Wit and Humour* appeared in 1875. See Life by Henry Johnson (1899).

Broom, a name given to a number of species of shrubs of the closely allied genera *Cytisus*, *Genista*, and *Spartium*, of the natural order Leguminosæ, sub-order Papilionaceæ—all of them having long slender branches, along which are produced axillary flowers.—Common Broom, *Cytisus (Sarcobatus) scoparius*, the trivial name being from the Lat. *scopæ*, 'long twigs,' or 'a besom'), is a well-known native of Britain, Europe, and Northern Asia, ranging also as far as the Canaries and the Azores, growing in dry soils, and ornamenting hedge-banks, hills, and bushy places, in May and June, with its large yellow flowers, which are on short stalks, drooping, solitary, but produced in considerable number along the straight slender branchlets. The lower leaves have three oblong leaflets, the upper ones are simple; the branches are angular and of a very dark green, very tough, and much in use for making besoms, as also in Belgium, &c., for baskets. They have also been used for tanning and dyeing; and their fibre has been woven into a coarse strong cloth, and even made into paper. In South Germany it is sometimes planted on sandy wastes for the sake of its fibres; while its ashes are also valuable additions to the soil on account of their high percentage of potash. The whole plant is very bitter, and the young tops and seeds are diuretic, hence the plant is a very unsuitable ingredient of fodder. The flowers were formerly employed in medicine (*flores sparti*), and as a yellow dye; they are much

visited by bees for cross-fertilisation, for which they are very beautifully adapted (see fig.). The mode of diffusion of the seed by the explosive rupture of the dry pod-valves in hot weather is also worthy of notice.

Broom inhabits colder climates than furze, reaching to a greater elevation on mountains, and being found beyond the northern limit of furze. It usually varies in size from 2 to 6 feet, but in some localities grows much larger, the wood then being of great value to cabinet-makers and turners. Although sometimes annoying to the forester, it is also capable of rendering him service as a quick-growing shelter to young trees, especially on wind-swept and sandy soils.—Irish Broom (*Cytisus* or *Sarothamnus patens*), not unfrequent as an ornamental plant in British shrubberies, is not at all a native of Ireland, but of Spain and Portugal.—Portugal Broom or White Broom (*C. albus*), a native of the countries bordering on the Mediterranean, is very often planted in Britain as an ornamental shrub, and is much admired for the beauty of its fasciated white flowers, which are produced upon long filiform branches. Its leaves have three leaflets. It sometimes attains a height of 15 or 20 feet.—Spanish Broom (*Spartium junceum*) is a native of the south of Europe, generally growing in dry soils and rocky situations, and attaining a height of 8 feet or upwards. Its branches are upright, round, and rush-like, a characteristic of this genus. They are smooth, and bear only a few small simple leaves, which soon drop off. It is the *Spartium* of the ancients, and the fibre of the branchlets has been used from time immemorial in some parts of Italy, France, and Spain, for making canvas, nets, ropes, &c., and even for the preparation of a kind of linen. Its twigs also are employed for basket-making, and the finer ones for tying up the grapes. In the south of France, the plant is cultivated on dry unproductive soils. The branchlets are made into bundles, dried, beaten, steeped, and washed, in order to the separation of the fibre. It possesses medical properties similar to those of the common broom.—A white-flowered species (*S. monospermum*), occasionally to be seen in British shrubberies, grows abundantly on the loose sands of the coasts of Spain, and produces a similar fibre. It is mentioned by Barth as growing in great abundance in Africa to the south of the Great Desert. Many species somewhat resembling these are occasionally to be seen in Britain among ornamental

Branch of Common Broom :
a, flowering branch.

plants, some of them often in greenhouses. The Canary Isles produce some remarkable for the fragrance of their flowers.—Dyer's Broom (*Genista tinctoria*) is, with other members of the same genus, a well-known source of yellow colouring matter. This European shrubby plant is thoroughly naturalised in some parts of North America. The name broom is not given to those species of *Cytisus* and *Genista* (q.v.) which do not display in a marked degree the character of having long slender twigs.—Butcher's Broom (q.v.) is a plant of an entirely different family.

Broom-corn, a grass cultivated in North America for the manufacture of brooms and whisks, which are made of the tops of the culms and the branches of the panicle. See **SORGHUM**.

Broome, SIR FREDERICK NAPIER, was born in Canada in 1842, and emigrated to New Zealand in 1857. Seven years later, on a visit to England, he married Lady Barker, whose *Station Life in New Zealand* (1869) quickly became popular. In 1869, too, Broome, who had meantime returned to England, formed a connection with the *Times*, and began to contribute prose and verse to the magazines. In 1875 he was appointed Colonial Secretary of Natal, in 1877 of Mauritius, in 1882 Governor of Western Australia, and in 1891 of Trinidad. He was knighted in 1877. He died 26th Nov. 1896.

Broomrape. See **OROBANCHEÆ**.

Brora Beds are a series of strata occurring at Brora, a village in Sutherlandshire, of the same age as the Inferior Oolite of Yorkshire. They are chiefly remarkable for the occurrence in them of a seam of coal of good quality $3\frac{1}{2}$ feet thick, being the thickest stratum of true coal hitherto discovered in any secondary strata in Britain.

Brose (Gaelic *brothas*), a dish sometimes used in Scotland, made by pouring boiling water, milk, or the liquor in which meat has been boiled, on oatmeal, and mixing the ingredients by immediate stirring. Butter may be added, and sweet milk when the brose is made with water. It is *kail-brose*, *water-brose*, or *beef-brose*, according to the liquid used. *Athole-brose*, a famous Highland cordial, is a compound of honey and whisky.

Broseley, a small town of Shropshire, on the Severn, 15 miles SE. of Shrewsbury, famous for its manufacture of excellent clay tobacco-pipes. Its 'churchwardens,' or long clay pipes, are in request all over England. Pop. of parish 4033.

Brosses, CHARLES DE, historian, was born at Dijon in 1709, and died president of the parliament of Burgundy, 7th May 1777. Among his works were: *Lettres sur Herculanum* (1750); *Histoire des Navigations aux Terres Australes* (1756), in which he introduced the names Australia and Polynesia; *Du Culte des Dieux Fétiches* (1760), the word *fetich* being first used by him in the sense now usual; the ingenious *Traité de la Formation Mécanique des Langues* (1765); and *Histoire de la République Romaine* (1777). His *Lettres écrites d'Italie en 1739-40* was edited by Colomb in 1885. See Marnet, *Le Président de Brosses* (1875).

Broth is an infusion or decoction of vegetable and animal substances in water. It is customary to use more or less meat, ox-flesh or mutton, with bone, and certain vegetables, as cabbage, greens, turnips, carrots, pease, beans, onions, &c. The whole are mixed together in cold water, heat slowly applied, and the materials allowed to simmer for some hours. The meat yields up certain ingredients, whilst others are retained in the residual flesh. Flesh heated with water yields to the water albuminous matter, gelatin, kreatin, extractive matters, lactic acid, salts, fat, saccharine matter; and leaves in the boiled meat fibrin, coagulated albu-

men, gelatinous tissue, fat, nervous matter. The vegetables yield albuminous constituents, colouring and mucilaginous matter, and volatile oils and salts. The real nutritive material present in broth is less than is generally thought, though it aids in satisfying the cravings of the appetite, and acts to a certain extent as a mild stimulant. See SOUP, BEEF-TEA.

Brothels. LAW AS TO. See NUISANCE, PROSTITUTION.

Brotherhoods. RELIGIOUS, were societies instituted for pious and benevolent purposes, and were numerous in the middle ages. Where the rules of monastic life appeared too narrow and severe, the Romish Church favoured a freer form of consecrated life without vows other than that of devotion to good works or penitential exercises, but in many other respects, as in living together and the like, resembling the spiritual orders. Such brotherhoods or confraternities were, in earlier times, those of Mary, of the Scapular, and of the Rosary; in later times, that of the Sacred and Immaculate Heart of Mary for the conversion of sinners, that of Francis Xavier or the Mission Brotherhood, and that of Christian Learning (*Frères ignorants*) for the education of the people. The bridge-building brotherhood (*Frères Pontifices*) originated in Southern France towards the end of the 12th century, and was recognised by Pope Clement in 1189. Their occupation was to keep up hospices at the most frequented fords of great rivers, maintain ferries, and build bridges. Other brotherhoods were the Familiars and Cross-bearers of the Inquisition in Spain, and the *Frères Calendarii* in North Germany and the Netherlands. The great brotherhood of Common Life was founded about 1376 by Geert Groote (born 1340; died 1384) and Florentius Radewin (born 1350; died 1400) at Deventer. Its members were sometimes styled Brethren of Good Will, also Hieronymites and Gregorians, from Hieronymus and Gregory the Great, whom they claimed as patrons. Community of goods, ascetic habits, industry, and the use of the vernacular language in divine service, were some of the chief points insisted on by the brethren who were not fettered by monastic or any other vows. Their principal occupations were the copying of the Bible and other books for the common purse, prayer, and the instruction of the young, and their services in the last direction can hardly be overestimated. Their most famous houses were those of Windesheim, near Deventer, and Agnetenberg, near Zwolle. They became numerous in the Netherlands and North Germany, but also spread themselves in Italy, Sicily, and Portugal, so that in 1430 they reckoned more than 130 societies. The last was founded in Cambrai in 1505. The most important and distinguished members of the society were Gerhard Zerbold of Zutphen, the famous Thomas-à-Kempis, and the learned Cardinal Nicholas Cusa.—Female societies of a similar character sprung up at the same time with those of the Brothers of Common Life. At the head of each was a superior or directress who was styled the *Martha*. See Kettlewell's *Thomas-à-Kempis and the Brothers of Common Life* (2 vols. 1882).

They were usually founded at first without ecclesiastical authorisation, on account of which several of the confraternities that either did not seek or did not obtain the recognition of the church, assumed the character of sects, and were suspected of heresy. To this class, among others, belonged the Beghards and Beguines (q.v.), the Brothers and Sisters of the Free Spirit, the Apostolic Brethren (q.v.), the Flagellants (q.v.), who, tolerated by the church for a while, at last incurred

its displeasure and were severely persecuted. The *Brothers of Christian Schools* are noticed at SCHOOLS. Even within the Protestant churches single brotherhoods have been formed, as the Rauhes Haus, founded by Wichern at Hamburg in 1833; those formed by Father Ignatius and the Cowley Fathers at Oxford are Anglican brotherhoods. Several similar institutions for women exist within the Church of England. See SISTERHOODS.

Brothers. a name given to three isolated mountains near the coast of New South Wales, between Harrington Inlet to the south, and Port Macquarie to the north. They are valuable as landmarks.—The name is also common to several groups of small islands.

Brothers. LAY, an inferior class of monks, not in holy orders, but bound by monastic rules, and employed as servants in Monasteries (q.v.).

Brothers. RICHARD, the originator of the Anglo-Israelite craze, was born in Newfoundland in 1757, and in 1772 entered the British navy, which he quitted with a lieutenant's half-pay in 1789. Refusing, from conscientious scruples, to take the oath requisite to enable him to draw his half-pay, he was reduced to great distress, and ultimately placed in the workhouse. In 1793 he announced himself as the apostle of a new religion, 'the Nephew of the Almighty, and Prince of the Hebrews, appointed to lead them to the land of Canaan;' and in 1794 he published a book, *A Revealed Knowledge of the Prophecies and Times*. For prophesying the death of the king, and the destruction of the monarchy, he was committed in 1795 to Newgate, and thence soon transferred to a lunatic asylum. His disciples included Nathaniel Halhed the M.P. and orientalist, Sharp the engraver, and Finlayson, a lawyer from Fife, with whom, after his release in 1806, he chiefly resided till his death on 25th January 1824.

Brough. See BROCHS.

Brougham. HENRY, LORD BROUGHAM AND VAUX, was born in Edinburgh, 19th September 1778. His father, Mr Henry Brougham, was the descendant of an old Westmoreland family, and his mother, Eleanor Syme, a woman of great worth and beauty, was a niece of Robertson the historian. Brougham received his education at the High School and at the university of Edinburgh. He gave early promise of future ability, some scientific papers written by him at the age of eighteen finding admission to the Transactions of the Royal Society. In 1800 he was admitted to the Scotch bar; in 1802 he helped to found the *Edinburgh Review* (q.v.), to whose first twenty numbers he contributed eighty articles. His Liberal views shut him out from the hope of promotion in Scotland, and a character which he had acquired for eccentricity and indiscretion excluded him from all legal practice, except the unremunerative practice of the criminal courts. In 1805 he settled in London; in 1806 was for three months secretary to a mission to Lisbon; and in 1808 was called to the English bar.

In London he first made his mark at the bar of the House of Commons as counsel for the Liverpool merchants who petitioned against the Orders in Council. Shortly after, in 1810, he entered parliament, and four months later brought in and carried his first public measure—an act making participation in the slave-trade felony. He was welcomed by the opposition leaders, to whose party he had attached himself, as a most powerful assistant in their attacks upon the government. In 1812 he succeeded in carrying the repeal of the obnoxious Orders in Council, and then ventured to contest the membership for Liverpool against Canning. He was defeated, and remained without

a seat till 1816, when he was returned for Winchester, and again became an active member of the opposition. By this time he had also established some reputation in the courts of law. He never, indeed, acquired a very large practice, but he repeatedly distinguished himself by speeches of great vigour and ability in the defence of persons prosecuted for libel by the crown. His most famous appearance as an advocate, however, was in defence of Queen Caroline (1820). His eloquence and boldness, though they forfeited for him the favour of the crown, gained him that of the people, and for the ten years between 1820 and 1830 Brougham was the popular idol. He made no bad use of his power. In 1822 he used it, though in vain, in support of a scheme of national education; and to his activity was due, in great measure, the establishment of the London University, of the first Mechanics' Institute, and of the Society for the Diffusion of Useful Knowledge. In 1830 he delivered a powerful speech against slavery, and in consequence of it—so he himself believed—was invited to stand, and returned, as member for the great popular constituency of the county of York. The aristocratically disposed Whigs would, had they dared, have excluded Brougham from the Reform ministry; but, in addition to his enormous popularity, he was virtually their leader in debate in the Commons, and thus, in spite of his unmanageableness, was indispensable. After various intrigues he was offered, and was persuaded, to accept a peerage and the chancellorship. He took his seat in the Lords in November 1830, and assisted materially in carrying the Reform Bill through that house. But his arrogance, self-confidence, and eccentricities, which sometimes verged on insanity, rendered him as unpopular with his colleagues as he was on the bench. He went out with the Whig government in 1834, and on its reconstruction five months later, found himself quietly shelved. He never held office again, never thenceforth exerted any appreciable influence on any great political movement, though still as before he continued to forward every measure for social progress, and was founder of the Social Science Association (1857).

It is as a law-reformer that Brougham will be best remembered. He took up Romilly's uncompleted task of carrying into practice the ameliorations suggested by Bentham. His efforts in this direction began as early as 1816, when he introduced into parliament a bill to remove various defects in the law of libel. In 1827, in a memorable six hours' speech, he enumerated the defects in nearly every branch of English law, and made proposals for dealing with law-reform on a proper scale. These, as might have been expected, met with little encouragement. It has been the fortune of many of his measures to be carried afterwards, in a mutilated form, by other hands. After he left office, Brougham also succeeded in carrying various reforms in the law, among which may be noted some very extensive changes in the law of evidence. His acts and bills, as well as those regarding the slave-trade, education, and other public questions, as those touching on law-reform, were collected and published by Sir J. E. Eardley Wilmot (1857). The large volume they form is the most fitting monument that could be preserved of the activity, perseverance, and public spirit of the man.

As an orator, more especially as a debater in parliament, Brougham was, among the men of his time, inferior only to Canning. He was wont, however, to indulge in his speeches in too large an admixture of exciting elements; argument was mingled with fiery declamation; ridicule,

sarcasm, invective, were freely used; and these he dealt out with a vehemence and energy that at times carried him far beyond bounds. The power of ready, rapid, and forcible diction was pre-eminently his. In many other fields besides oratory he won a high reputation. He cultivated mathematical and physical science, and ventured upon the domains of metaphysics, history, theology, even romance. His miscellaneous writings are upon an almost incredible variety of subjects, and, numbering 133, fill 11 vols. in the collected edition (1855-61; 2d ed. 1873). They were, however, intended more to serve purposes of the moment, than as permanent additions to our literature; and though they display great powers of rapid comprehension and nervous clear exposition, it cannot be said that we are indebted to their author for any new truths in politics or morals, or any original discoveries in science.

While not engaged in parliament, Brougham chiefly resided at Cannes, in the south of France, where he had built a château in 1835, and where he died 7th May 1868. Two daughters had long predeceased him, and the title passed to his brother William (1795-1886). Brougham's memoir of his own Life and Times (3 vols. 1871) was written in extreme old age, and is very untrustworthy. Peacock hit him off well in *Crotchet Castle* as 'the learned friend'; and Rogers remarked of him, as he once was leaving Panshanger, 'There goes Solon, Lycurgus, Demosthenes, Archimedes, Sir Isaac Newton, Lord Chesterfield, and a great many more in one post-chaise.' O'Connell's gibe, on Brougham's elevation to the woolsack, was less kindly: 'If Brougham knew a little of law, he would know a little of everything.'

Broughton. RHODA, a popular novelist, was the daughter of a clergyman, and was born 29th November 1840. One of her first novels, and perhaps her best, is *Not Wisely but Too Well* (1867). Others are *Coneth up as a Flower* (1867), *Red as a Rose is She* (1870), *Nancy* (1873), *Joan* (1876), *Belinda* (1883), *Doctor Cupid* (1886), *Alas!* (1890), *A Beginner* (1894), *Scylla and Charybdis* (1895), *Dear Faustina* (1897), *The Game and the Candle* (1899). Her later works are not her best. Her plots are usually but ill constructed, her cynicism is shallow and unreal, and her stories too often contain equivocal situations unjustified by dramatic necessity; but the work shows a vigorous individuality, and the style is clever and graphic, though too often marred by a vulgarity that seems in grain. 'In Miss Broughton's determination not to be mawkish or missish,' says Mr Trollope, 'she has made her ladies do and say things which ladies would not do and say.' Her heroines need not be so often plain, so often extravagantly worship or detest their parents, nor take such an unconscionable time in dying; while her abuse of italics and the present tense are devices that are merely monotonous, and add no strength to the work of so clever a writer.

Broughty-Ferry. a town of Forfarshire, on the Firth of Tay, $\frac{3}{4}$ miles E. of Dundee. It is connected with Tayport, in Fife, by a railway-ferry over the firth, here a mile broad, which, before the opening of the Tay Bridge, to the westward, formed the chief connection between Edinburgh and Fife with Dundee. Many Dundee merchants occupy fine villas at Broughty-Ferry, and it enjoys all the amenities of a favourite watering-place. On the shore stands a castle, which, built in 1498, was held by the English 1547-50. In 1860-61 it was repaired as a defence for the Tay. Pop. (1861) 3513; (1891) 9256.

Broussa. BRUSA, or BOURSA, the ancient *Prusa*, where the kings of Bithynia usually resided, situated in Asiatic Turkey, at the foot of Mount

Olympus, in Asia Minor, 13 miles S. of the Sea of Marmora. Broussa is pleasantly situated, facing a beautiful and luxuriant plain. The water-supply is good, and water flows down the centre of some of the streets, which are clean, but for the most part narrow and dark, and the bazaars very good. It contains about 200 mosques, some of which are very fine buildings, also three (Greek churches, an Armenian and several synagogues. The old citadel stands on a rock in the centre of the town. Both Greeks and Armenians have an archbishop here. The silks of Broussa are much esteemed, but the production of the silk-factories, many of which are in the hands of Europeans, has fallen off. Wine is largely produced by the Greeks, and fruit is exported; carpets and tapestry are also made. As capital of a vilayet (often called Khodavendighiar), Broussa is the official residence of a Turkish pasha, and the seat of a Turkish tribunal. Broussa is subject to frequent earthquakes. In ancient times it was famous for its thermal baths, which are still much esteemed; they are sulphurous, and spring out of the flank of Mount Olympus. During the terrible earthquakes of 1855, they ceased for a time to flow, but soon returned with a fuller current than before. Meerschaum clay is also obtained from a hill in the vicinity. Prusa is said to have been built by Prusias, king of Bithynia. It was plundered by the Saracens in 950, but retaken and fortified. The sultan Othman besieged it in 1317; and in 1327 his son Orkhan, the second emperor of Turkey, captured it, and made it the capital of his empire, and it continued so until the taking of Constantinople by Mohammed II. in 1453. The first six sultans of the Ottoman empire are buried here. Ibrahim Pasha occupied the city in 1833; Abd-el-Kader found refuge here from 1852-55. The population of Broussa amounts to about 37,000 souls, of whom 5000 are Greeks.

Broussais, FRANÇOIS JOSEPH VICTOR, the founder of a theory of medicine, was born at St Malo, 1772, and served as a surgeon in the navy and army. In 1820 he was appointed professor at the military hospital of Val-de-Grace. In 1830 he became professor of General Pathology in the Academy of Medicine in Paris, and afterwards was made a member of the Institute. He died at Vitry in 1838. His peculiar views are fully explained in his chief work—the *Éléments de la Doctrine Médicale Généralement Adoptée* (1816), which asserts the following principles; that life is sustained only by excitation or irritation; that this excitation may be either too strong (*surexcitation*) or too weak (*adynamie*). These abnormal conditions at first manifest themselves in a specific organ of the body, but afterwards, by sympathy, are extended to other organs, as in fever—i.e. all diseases are originally *local*, and become *general* only by sympathy of the several organs. His theory and practice, which strongly resemble the Brunonian system of John Brown (q.v.), gained many adherents in France, who took the name of the 'Physiological School.'

Broussonetia. See MULBERRY.

Brouwer (sometimes written BRAUWER), ADRIAN, a Dutch painter, was born at Oudenarde (now in Belgium) in 1605 or 1606, of extremely poor parents, studied at Haarlem under Franz Hals, and about 1630 settled at Antwerp. Here, under the influence of Rubens, who thought highly of him, he attained to great brilliancy of colour; and from the beginning he had shown great power of strong and graphic characterisation. His favourite subjects were scenes from tavern life, country merry-makings, card-players, smoking and drinking groups, and roisterers generally. His life

was dissipated and embarrassed by debt; and he died of the plague in an Antwerp hospital in 1638, not yet thirty-three years of age. His influence was marked on Teniers the younger, Van Ostade, and others. His best pictures are at Munich, St Petersburg, Madrid, Dresden, and Vienna. See *Lives* by Schmidt (Leip. 1873) and Bode (Vienna, 1884).

Brown, MOUNT, in the Rocky Mountains, near the source of the Columbia River, and on the borders of British Columbia and Alberta, is 16,000 feet high.

Brown, CHARLES BROCKDEN, an American novelist, of Quaker ancestry, was born at Philadelphia, January 17, 1771. After abortive studies in law he adopted literature as a profession, the first American to do so. *Wieland* (1798), the earliest of his fictions, was followed in 1799 by *Ormond, or the Secret Witness*, in which the character of Constantia Dndley was greatly admired by Shelley. Other novels were: *Arthur Mervyn, or Memoirs of the Year 1793*—the fatal year of yellow-fever in Philadelphia; *Edgar Huntly, or the Adventures of a Sleep-walker* (1801); *Clara Howard* (1801); and *Jane Talbot* (1804). He died of consumption, February 22, 1810. Brown had great imaginative and psychological ingenuity. He invents incidents and analyses feelings with remarkable subtlety, but his success is marred by lack of reality and extravagance. As a novelist he owed much to Godwin. A Life of Brown by W. Dunlap was prefixed to the edition of his novels in 7 vols. (Boston, 1827); there is another edition in 6 vols. (Philadelphia, 1857); re-issued, 1887). See Life by W. H. Prescott (1834).

Brown, FORD MADOX, historical painter, one of the most intellectual, forcible, and unconventional artists of our time, grandson of the founder of the Brunonian system of medicine, was born at Calais in 1821. His earlier studies were conducted mainly at Antwerp, under Baron Wappers, who, in his turn, had been influenced by the Romantic school of France; and, after a brief period spent in portrait-painting in England, he resided for three years in Paris, where he produced his 'Manfred on the Jungfrau' (1841), and 'Parisina's Sleep' (1842), works intensely dramatic in feeling, but sombre in colouring. In 1844-45 he contributed three subjects to the Westminster cartoon competitions, preliminary to the mural decoration of the Houses of Parliament, works praised by Haydon, though they gained no prize; and one of them was carried out in 1861 as an oil-picture, titled 'Willelmus Conquistator,' one of the most dignified and monumental of the artist's productions. A visit to Italy about 1845 led him to seek greater variety and richness of colouring, and its results were seen in 'Wyclif reading his Translation of the Scriptures to John of Gaunt' (1848), and 'Chaucer reciting his Poetry at the Court of Edward III.' (1851). Already his art had been developing new aims, which demanded fresh methods for their expression; and gradually he formed a style characterised by great originality, force, and directness, much in harmony with that of the Pre-Raphaelites, and, in point of time, anticipating their efforts. In 1850 he was a contributor of verse, prose, and design to the Pre-Raphaelite magazine the *Germ*, and in his youth Rossetti worked in his studio. Among the most important works in his fully developed manner are 'Cordelia and Lear,' 'Christ washing Peter's Feet,' 'Work,' 'The Last of England,' 'Romeo and Juliet,' 'The Entombment,' 'Cromwell dictating the Vandois Despatch to Milton,' and, in landscape, the 'English Summer Afternoon.' In 1865 he held an exhibition of his collected works in London, the interesting and valuable descriptive catalogue of which was written by himself. He was known to

some extent as a book-illustrator, and among his designs for stained glass are the windows of St Oswald's, Durham. From 1879 till a few months before his death—which took place on the 6th October 1893—he was engaged upon a great series of twelve subjects from local history for the town-hall of Manchester. They are executed by the Gambier-Parry process, the earlier works being painted directly upon the prepared surface of the walls, and some of the later upon canvas.—His son, OLIVER MADOX BROWN, author and artist, was born at Finchley, 20th January 1855. At the age of twelve he executed a water-colour subject—'Margaret of Anjou and the Robber'—of very considerable merit; two years later his 'Chiron' was shown at the Dudley Exhibition; in 1870 his equestrian 'Exercise' found a place on the line in the Royal Academy; and already two of his designs, 'The Deformed Transformed' and 'Mazeppa,' had been engraved. In 1871–72 he wrote his first novel, published in an altered and mutilated form in 1873, under the title of *Gabriel Deuver*, and reprinted in original form and under its first title of *The Black Swan* in his *Literary Remains* (1876). As the work of a lad under seventeen, it is a marvellous production. The tales of *The Dwale Bluth* and *Hebditch's Legacy*, with some minor narrative pieces, were left incomplete at the time of their author's death. As a poet he was no less precocious. At the age of fourteen he had written several remarkable sonnets; and from time to time he produced lyrics and other fragments in which the dominant note is that same passionate intensity which is the main characteristic of his fiction. His promising career was cut short; he died of blood-poisoning on the 5th November 1874.

See a life of the father by Ford Madox Hueffer (1893), and of the son by J. H. Ingram (1883).

Brown, SIR GEORGE, British general, was born at Linkwood, near Elgin, in 1790, and entered the army in 1806. He served through the Peninsular campaign (1808–13), and in 1814 joining Ross's expedition against the United States, was wounded at the battle of Bladensburg, and obtained his lieutenant-colonelcy. In the Crimean war (1854–55) he commanded the Light Division, and was severely wounded at Inkermann. In 1855 he was created a G.C.B., and in 1856 was gazetted 'General for distinguished service in the field.' In 1860 he became commander-in-chief in Ireland, and he died at Linkwood, 27th August 1865.

Brown, GEORGE LORING, American artist, born in Boston, 2d February 1814, spent more than twenty years in the art-centres of Europe, and returned to America in 1860 with a high reputation as a landscape-painter. His works include American and Italian landscapes of considerable merit, among the more important being 'The Crown of New England' (1861), purchased by the Prince of Wales; 'Niagara by Moonlight' (1876); and Venetian scenes. He died 25th June 1889.

Brown, HENRY KIRKE, sculptor, born at Leyden, Massachusetts, in 1814. He studied for some years in Italy, and returning in 1846, settled at Brooklyn, where he executed the first bronze statue ever cast in America. Besides several subjects in marble, his notable works include statues of Lincoln in Brooklyn and New York, an equestrian statue of General Scott in Washington, and a colossal equestrian statue of General Washington in Union Square, New York. He died July 10, 1886.

Brown, JOHN, of Haddington, author of the *Self-interpreting Bible*, was born in 1722 at Carpow, near Abernethy, Perthshire. A poor weaver's child, at the age of eleven he lost both father and mother, and himself shortly afterwards all but died

of four fevers. His schooling was scanty; but, as a herd-boy on the Tayside hills, he studied Greek, Latin, and Hebrew with such success that the neighbours declared he had dealings with the evil one. Once, after folding his flock, he set off for St Andrews, 24 miles away, and stood the next morning in a bookseller's shop, inquiring the price of a Greek Testament. The man laughed at him; but a professor, who was in, said he would give him one if he could read a verse. Ay, could he; and so the Testament was his. Then he turned pedlar, a pedlar like him in Wordsworth's *Excursion*; during the '45 served in the Fife militia; and from 1747 to 1750 was a schoolmaster at Gairney Bridge, near Kinross, and at the Spittal, near Penicuik. The vacations were devoted to theological study in connection with the Associate Burgher Synod; and in 1751, having the year before been licensed to preach, he was called to the congregation at Haddington. He was a man of great learning, knowing Latin, Greek, Hebrew, Arabic, Syriac, Persian, and Ethiopic, French, Spanish, Dutch, German, and Italian; open-handed, on a stipend of from £40 to £50 a year; not narrow-minded, the age and his station considered; a kindly humorist, though harrowing self-doubts tormented him all his life through; and a powerful preacher, witness David Hume's well-known remark: 'That's the man for me, he means what he says; he speaks as if Jesus Christ was at his elbow.' In 1768 he accepted the unsalaried Burgher chair of Divinity; in 1784 he refused the pastorate of the Dutch Church at New York; and on 19th June 1787 he died at Haddington. Of his twenty-seven ponderous works, published between 1758 and 1804, and dealing with the Scriptures, church history, &c., the most widely known are the *Dictionary of the Bible* (1768) and the *Self-interpreting Bible* (2 vols. 1778), whose object was 'to condense within a reasonable space all the information which the ordinary reader may find necessary for attaining an intelligent and practical knowledge of the sacred oracles.' See his *Memoirs and Select Remains*, edited by the Rev. W. Brown (Edin. 1856).

JOHN BROWN, D.D., his grandson, was son of the Rev. John Brown of Whitburn (1754–1832), and nephew to the Rev. Ebenezer Brown of Inverkeithing, whose eloquence amazed Brougham and Jeffrey. Born in 1784, he studied at Edinburgh University from 1797 to 1800, and then, not yet sixteen years old, left home with his father's blessing and a guinea, to keep school for three years at Elie, meantime attending, during the summer vacations, the Burgher Theological Hall at Selkirk. In 1806 he was ordained to a pastorate at Biggar; in 1822 accepted a call to Rose Street Church, Edinburgh; and thence in 1829 was translated to Broughton Place. Created a D.D. of Jefferson College, Pennsylvania, in 1830, he was elected professor of Exegetical Theology in 1834; during 1840–45 was engaged in the vexatious atonement controversy; and died 13th October 1858. He published close upon twenty religious works; but for us the interest is in the man himself, strong, saintly, learned, yet with a passion for riding, and 'a steady liking, nay hunger, for a good novel.' See Dr Cairns's Memoir of him (1860), and especially the letter, appended thereto, by his son.

That son, DR JOHN BROWN, the essayist, was born at Biggar, 22d September 1810. Till 1822 his education was undertaken by his father, who had lost his first wife in 1816; then, when the family removed to Edinburgh, the boy had four years at a classical academy and the High School. In 1826 he entered on the arts course at the university, and in 1828 on the medical, at the same time becoming pupil and apprentice to Syme, the eminent surgeon. In 1833, after a year spent at Chatham

—the great cholera year—as a surgeon's assistant, he graduated M.D., and at once established a practice in Edinburgh. It never was large, for he was something besides a doctor, and nothing at all of a money-getter. His life was quiet and uneventful, save that its latter years, all but the last one, were clouded by fits of the darkest depression. The end came somewhat suddenly, but sweetly, on 11th May 1882. He is buried beside his father in the New Calton Cemetery. Almost all Dr John Brown's writings are comprised within three volumes—the two *Horæ Subsecivæ* ('leisure hours,' 1858-61), and *John Leech and other Papers* (1882). Editors and publishers had to 'pester' him to write, for he was distrustful, as few men, of his powers, believing that none should venture to publish aught 'unless he has something to say, and has done his best to say it aright.' Herein lay the secret of his writing so little, and of that little's hyper-excellence. Dogs, children, old-world folk, friends gone before, and lowland landscapes—these are the subjects which he wrote on best; his essays on art and medical topics are good, but it is not by them that he will be remembered. Humour is the chief feature of his genius—humour with its twin-sister pathos; we find them both at their highest perfection in his sketches of 'Rab' and 'Marjorie'—the uncouth mastiff and the dear dead child. Then, silent Minchmoor, the Enterkin's wild pass, and peaceful Inchmahome—he is to them what Wordsworth is to Yarrow; himself to Yarrow he applied that most exquisite epithet, 'fabulosus as ever Hydaspes.' Writing of nothing that he did not know, he wrote, too, of nothing that he did not love, or at least did not greatly care for. Hence both the lucidity and the tenderness of his essays. They rank with Lamb's, and with Lamb's alone in the language. See Swinburne's Sonnet, *John Brown and his Sister Isabella* (2d ed. 1890), and *Peddie's Recollections of Dr John Brown* (1893).

SAMUEL BROWN, M.D., chemist, was a grandson of John Brown of Haddington, and son of Samuel Brown, provost of that burgh (1779-1839), who in 1817 established the East Lothian itinerating libraries. Born in 1817 at Haddington, he was educated there till 1830, when he entered the Edinburgh High School. Thence in 1832 he passed on as a medical student to the university, and, after a visit to St Petersburg (1837-38), graduated M.D. in 1839, but immediately surrendered himself to the fascination of chemistry. The dream of his life was the possibility of reconstructing the whole science of atomics, and to its experimental realisation he devoted his nights and days with all the self-forgetful ardour of the medieval alchemist. In 1843 he delivered in Edinburgh four memorable lectures on the atomic theory, but in the same year was unsuccessful in his candidature for the chair of Chemistry. His noble sincerity of nature, his subtlety and versatility of intellect, and his brilliant conversational powers endeared him to a group of friends that included such figures as Edward Forbes, De Quincey, Jeffrey, Carlyle, Harriet Martineau, and Emerson. For some years his health was uncertain, and he died at Edinburgh, 20th September 1856. He was author of the *Tragedy of Galileo* (1850), a monograph on his father (1856), and two admirable volumes of *Essays, Scientific and Literary* (1858), on Chemistry, Nature and Man, Christianity, George Herbert, David Scott, Physical Britanism, Magnetism, Ghosts, &c. See *North British Review*, Feb. 1857.

Brown, JOHN, M.D., founder of the Brunonian system of medicine, born in 1736, of poor parents, in Bunkle parish, Berwickshire, was educated at the grammar-school of Duns. At school he was looked upon as a prodigy, his physical powers were great,

he possessed strong intelligence, and an extraordinary memory. After acting as teacher and tutor in Duns and Edinburgh, he obtained leave from Munro, professor of Anatomy, and the other professors, to attend their lectures free; meanwhile he was tutor to the children of the celebrated Dr Cullen, and became his assistant in his university lectures. Conceiving himself slighted by Cullen, he commenced giving lectures himself upon a new system of medicine, according to which all diseases are divided into the sthenic, or those depending on an excess of excitement, and the asthenic, those resulting from a deficiency of it; the former to be removed by debilitating medicines, as opium, and the latter by stimulants, such as wine and brandy. His system, in which he freely exposed the errors of former systems, and those of Dr Cullen, gave rise to much opposition, but his partisans were numerous; for a time his opinions had some influence, and what was true in his lectures has been gradually adopted in ordinary medical treatment. In 1779 he took the degree of M.D. at the university of St Andrews, and in 1780 published his *Elementa Medicinæ*. He was noted for the freedom with which he wrote and spoke Latin. A Life by Dr Beddoes of Bristol was prefixed to the second edition (2 vols. 1795) of Brown's own English translation. The book was reprinted on the Continent and in America, and translated into French, Italian, and German. He also wrote *On the Present System of Spasm as Taught in the University of Edinburgh* (1787), and a *Short Account of the Old Method of Cure*. Being overwhelmed with debt, for which he was at one time thrown into prison, in 1786 he removed to London, where he was again in difficulties. Just as his prospects had begun to brighten, and as he had arranged with a publisher to produce a work on gout for £500, with literary work mapped out for ten years to come, he was struck down by apoplexy, of which he died, 17th October 1788. His works were edited, with a memoir by his son, Dr William Cullen Brown (3 vols. 1804). The merits and demerits of the Brunonian system continued to be matter of controversy both in Europe and the colonies long after the death of its founder. Vol. ii. of Thomson's *Life of Cullen* (1859) is largely occupied with a discussion of the system; and Hirschel published, in German, a *History of the Brunonian System* (1846).

Brown, JOHN, of Ossawatimic, abolitionist, was born in Torrington, Connecticut, May 9, 1800. Descended in the sixth generation from Peter Brown, a Mayflower pilgrim, he preserved the stern religious enthusiasm of his ancestors. In 1805 his father, Owen, removed to Hudson, Ohio, and in 1812 had a contract to supply Hull's army with beef. John, already a vigorous lad, accompanied his father to Detroit, and acquired a hatred of both war and slavery. He became a tanner and land-surveyor, and from 1825 to 1835 lived at Richmond, Pennsylvania, where he was made postmaster. Returning to Ohio he engaged in land speculations, which proved disastrous, and then turned shepherd. In 1846 he removed to Massachusetts, but in 1848 purchased a farm at North Elba, New York. He wandered much through the country in prosecution of anti-slavery enterprises, in which he was assisted by his family. He was twice married and had twenty children. In 1854 five of his sons removed from Ohio to Kansas, and he joined them in the next year after the border conflict had begun. Brown became a leader in the strife, and two of his sons were arrested by United States cavalry. Soon after the town of Lawrence was sacked by border ruffians, he ordered five pro-slavery men at Pottawatomie to be slain as dangerous. Ossawatimic,

Brown's home, was burned August 30, 1856, and his son killed. When the war in Kansas ceased, Brown began to drill men in Iowa, using rifles which had been sent to him from Massachusetts. His scheme then was to establish a stronghold in the mountains of Virginia as a refuge for runaway slaves. This plan was disapproved by the few to whom he mentioned it, and he resumed anti-slavery work in Southern Kansas. In June 1859 he hired a farm near Harper's Ferry, and here gathered twenty-two men, of whom six were coloured. Boxes of rifles, pistols, and pikes were also received. On Sunday night, October 16, with eighteen men, he broke into the United States armoury in the town and took several citizens prisoners. On Monday some fighting took place, and Colonel Robert E. Lee, with a company of marines, arrived from Washington. Lieutenant J. E. B. Stuart, who accompanied them, recognised Brown, whom he had met in Kansas. Brown, with six men, now driven into the engine-house, refused to surrender, and continued to fight until his two sons were killed and himself severely wounded. Brown was tried by a Virginia court for conspiracy to produce insurrection, for treason, and for murder. He was convicted and hanged at Charlestown, Virginia, December 2, 1859, having shown the utmost firmness throughout his imprisonment. Four of his men were executed with him, and two others later; six escaped. The raid was investigated by a committee of the United States senate. Its full effects were not seen until the civil war was over. Brown's Life has been written by James Redpath (1860) and by F. B. Sanborn (1885).

Brown, ROBERT, an eminent botanist, the son of an Episcopal clergyman, was born at Montrose, Scotland, December 21, 1773, and educated there and at Marischal College, Aberdeen. While a student of medicine at the university of Edinburgh, he evinced a strong taste for botanical studies. He became, in 1795, ensign and assistant-surgeon in a Scottish Fencible regiment, with which he went to Ireland. In 1798 he visited London, and was introduced to Sir Joseph Banks, who gave him the free use of his collections and library. Devoting himself to the study of botany, he resigned his commissions in 1800, and the following year was, on the recommendation of Sir Joseph Banks, engaged as naturalist in the expedition sent out under Captain Flinders for the survey of the Australian coasts. On his return in 1805 he brought home nearly four thousand species of Australian plants, a large proportion of which were new to science. Soon after, he was elected an associate and appointed librarian to the Linnean Society. To the *Transactions* of the Edinburgh Wernerian Society, and those of the Linnean Society, he contributed memoirs on *Asclepiadaceae* and *Proteaceae*, and published *Prodromus Florae Novae Hollandiae et Insulae Van Diemen* (vol. i. 1810); a supplement to this work appeared in 1830, relating to the *Proteaceae* only. He also wrote the *General Remarks on Botany*, attached to the narrative of Captain Flinders' expedition (1814). His adoption of the natural system of Jussieu led to its general substitution in place of the Linnean method. Brown's numerous memoirs in *Transactions* of societies, and other contributions to botanical science, secured for universal approval the title conferred on him by Alexander von Humboldt of 'facile princeps botanicorum.' In 1810 Brown received the charge of the library and splendid collections of Sir Joseph Banks, which in 1827 were transferred to the British Museum, when he was appointed keeper of the botanical department in that establishment. In 1811 he was elected F.R.S.; in 1832, D.C.L. of Oxford; and in 1833 was elected one of the foreign

associates of the Academy of Sciences of the Institute of France. In 1839 the Royal Society awarded him their Copley medal. Sir Robert Peel granted him a pension on the Civil List of £200 a year. He was president of the Linnean Society from 1849 to 1853. Darwin thought him 'chiefly remarkable for the minuteness of his observations, and their perfect accuracy. His knowledge was extraordinarily great;' much of it died with him, however, owing to his morbid fear of committing himself to mistakes. Brown died in London, June 10, 1858. A collected edition of Brown's works was published in Germany in 1825-34. The Ray Society in 1866-68 reprinted his complete works, except the *Prodromus*, under the editorship of Mr J. J. Bennett. See BOTANY.

Brown, THOMAS, a Scottish metaphysician, born in 1778 at the manse of Kirkmabreck, Kirkcudbrightshire, went to Edinburgh in 1792, and for several years attended the university, though without ever completing the arts curriculum. He began the study of the law, but shortly abandoned it for medicine, and became in 1806 the partner of Dr Gregory in his large practice. His strong bent, however, was for literature and philosophical speculation. At the age of twenty he had published a refutation of Darwin's *Zoonomia*, and he contributed at the outset to the *Edinburgh Review*. In 1804 appeared his essay on *Cause and Effect*, in which he holds that there is nothing in a cause but the fact of immediate and invariable antecedence to the change called its effect. Dugald Stewart, professor of Moral Philosophy in the university, being obliged, from bad health, to retire in 1810, Brown was appointed colleague and successor, which office he continued to discharge till his death during a visit to London, 2d April 1820. He was popular as a professor; and his *Lectures*, published after his death, reached its 19th edition in 1851, although the book has now fallen into neglect. He also wrote a good deal of rather indifferent poetry. Brown attempted to overturn the psychological system of his predecessors, Reid and Stewart, and to substitute a new and simplified scheme of mental phenomena. The greater part of this new philosophy was the production of his first session as professor, the writing of each lecture being begun on the evening previous to its delivery. A philosophic system thus improvised could not be but crude and inconsistent, however acute and imaginative its author might be. From their subtlety and originality his works were valuable in their time, as suggesting and advancing the solution of many problems; but the lack of a coherent system, due to their incompleteness, will largely account for their having been superseded by later writings. Brown's chief contribution to psychology is the establishment of a sixth or *muscular sense*.

Brown, TOM, 'of facetious memory' in Addison's phrase, was born at Shiffnal, Shropshire, in 1663. His studies at Christ Church, Oxford, were most probably cut short by his irregularities, but are remembered by his clever extempore translation and application to Dr Fell, the dean of Christ Church, of Martial's epigram, 'Non amo te, Sabidi:' 'I do not love thee, Dr Fell, the reason why I cannot tell.' After a few years of teaching at Kingston-on-Thames, he settled in London, where he made an uncertain living by writing satirical poems and pamphlets, many of them remarkable more for their vigour and scurrility than their wit. He is principally interesting now as the assailant of much better men than himself, among them Dryden, Sherlock, Tom Durfey, and Sir Richard Blackmore. He lived a shifty and

disreputable life, and died 16th June 1704, being fittingly buried near his friend, Mrs Afra Behn. His works were collected into 3 vols. (1707-8).

Brown, Sir William, founder of the Liverpool Free Library, was born at Ballymena, County Antrim, in 1784, and sailed in 1800 with his parents for Baltimore, U.S. Returning in 1809, he established at Liverpool a branch of his father's linen business, and laid the foundation of one of the largest mercantile firms in the world. A liberal reformer and able advocate of a decimal coinage, he took a prominent part in local and public affairs, and unceasingly promoted the education of the people. In 1844 he vainly contested South Lancashire, but was returned for it in 1846, and was thrice afterwards re-elected. In 1857, at a cost to himself of £40,000, he founded the Free Public Library of Liverpool, and in 1859 he raised a corps of volunteer artillery. He was made a baronet in 1863, and died 3d March 1864, leaving a fortune of £900,000 personalty.

Brown Coal. See LIGNITE.

Browne, Charles Farrar, American humorist, commonly known by his pseudonym 'Artemus Ward,' was born in Watford, Maine, 26th April 1834. Having learned type-setting in a newspaper-office at Skowhegan, Maine, he soon removed to Boston, and thence to Toledo and Cleveland. Meantime he had become a reporter and contributor to the newspapers. In 1858, under the style of 'Artemus Ward, showman,' he wrote for the *Cleveland Plaindealer* a description of an imaginary travelling menagerie. This was followed by letters professedly from the same source, in which grotesque spelling and an inextricable interweaving of business puffery and moralising served to convey sound sense and shrewd satire. The letters were widely circulated, and the author was invited to a share in the editorship of a new comic paper, *Vanity Fair*, in New York. In the stress of war times the paper failed, after a brilliant career, and in December 1861 'Artemus Ward' entered the lecture field. Under the title, *The Babes in the Wood*, he delivered a telling satire on the dull twaddle which had been imposed on the public by pompous bores. Such was its success that a theatrical manager in California telegraphed to him, 'What will you take for forty nights in California? Answer immediately.' His prompt reply, 'Brandy-and-water,' assured him a welcome among the miners. Making his way thither by stage-coach over the plains and Rocky Mountains, 'Ward' had some experience with the Indians, and especially with the Mormons, 'whose religion,' he afterwards explained, 'is singular, but their wives are plural.' As an adjunct to his lectures on these attractive topics, he got a panorama, whose artistic wretchedness furnished occasion for countless jokes. In 1864 the lecturer was disabled by pulmonary consumption. In 1866, having rallied somewhat, he went to England, where he was received in the most friendly manner. He contributed to *Punch*, still in the character of 'the genial showman.' In November he opened the exhibition of his panorama in Egyptian Hall in London, and achieved great popularity as a representative of American humour. Though the seal of death was on his features, he did not abate any of his quaint originality and amusing satire. His keen observation and graphic revelation of human nature stood forth from a background of truisms, which removed for a time any suspicion that the satire was aimed at the audience. In February 1867 Browne went for the benefit of his health to the Isle of Jersey, but returned to die at Southampton, England, 6th March 1867. He was deeply beloved by his asso-

ciates, and tenderly devoted to his mother, to whom he left a modest competence. His writings were gathered into several volumes: *Artemus Ward, His Book* (1862); *Artemus Ward, His Panorama* (1865); *Artemus Ward among the Mormons* (1866); *Artemus Ward in England* (1867).

Browne, Edward Harold, divine, was born 6th March 1811, at Morton House, Bucks, and educated at Eton, and at Emmanuel, Cambridge. He became fellow and tutor, professor of Hebrew at Lampeter (1841), and of Divinity at Cambridge (1854), Bishop of Ely (1864), and of Winchester (1873). His works comprise several volumes of sermons, a book on the Pentateuch, and the *Exposition of the Thirty-nine Articles* (1850; 13th ed. 1887). He died 17th December 1891. See his Life by Dean Kitchin (1895).

Browne, Hablot Knight, artist, the 'Phiz' of many clever and humorous book-illustrations, was born at Kennington, Surrey, 15th June 1815. He early showed a strong taste for drawing, and was apprenticed to Finden; but the laborious methods of line-engraving were little to his taste, and he took to the freer processes of etching and water-colour painting, and in 1833 gained a medal from the Society of Arts for an etching of 'John Gilpin.' In 1836 Browne succeeded Seymour and R. W. Buss as illustrator of Dickens's *Pickwick*, competing successfully against Thackeray for the work; and he soon enjoyed a reputation which was continued and preserved by his designs to *Nicholas Nickleby*, *Master Humphreys's Clock*, *Martin Chuzzlewit*, *Dombey*, *David Copperfield*, *Bleak House*, *Little Dorrit*, and *A Tale of Two Cities*. He also illustrated many of Lever's and several of Ainsworth's novels. He laboured for thirty years with unceasing activity, save for occasional breaks during the hunting-season, and a little travel. In 1867 he was struck with paralysis; he died at West Brighton, 8th July 1882. His son, W. Gordon Browne, is also known as a book-illustrator. See Life, by D. C. Thomson (1884).

Browne, Robert, founder of the Brownists, was born about 1550 at Toilethorpe, Rutlandshire, and after graduating at Cambridge in 1572, was a schoolmaster in London, and an open-air preacher. In 1580 he began to attack the order and discipline of the Established Church, and soon after formed a distinct church on congregational principles at Norwich. Committed by Bishop Freake to the custody of the sheriff, he was released through the influence of his kinsman, Lord Burghley; but in 1581, with his followers, was obliged to take refuge at Middelburg, in Holland. In 1584 he returned, *via* Scotland, to England, and reconciling himself to the Established Church, in 1586 became master of Stamford grammar-school, in 1591 rector of Achurch, Northamptonshire. Of a very violent temper, he was, when eighty years old, sent to Northampton jail for an assault on a constable, and in jail he died about 1633. The Brownists continued, notwithstanding their leader's defection, to subsist as a separate sect for some time both in Holland (among the English there) and in England. From Holland many of them sailed for America in 1670, the rest being absorbed in the Presbyterian Church in 1701; in England, they may be said to have given birth to the Independents or Congregationalists.

Browne, Sir Thomas, author of the *Religio Medici*, was born in London, October 19, 1605, the son of a mercer of good family at Upton in Cheshire. His father died early, and his mother married again, leaving her son to the care of a rapacious guardian who seems to have made inroads upon his ward's fortune of £6000. He was educated at Winchester College and at Broadgate Hall (now

Pembroke College), Oxford, graduating B.A. in 1626 and M.A. in 1629. He next studied medicine, travelled in Ireland, France, and Italy, continued his medical studies at Montpellier and Padua, graduated as Doctor of Medicine at Leyden about 1633, and at Oxford in 1637, settling the same year at Norwich. He lived calmly throughout the troubles of the Civil War; maintained an active correspondence with some of the most learned antiquaries and scientists of his time, as Evelyn, Dugdale, Elias Ashmole, and Ray the naturalist; and was knighted by Charles II. on his visit to Norwich in 1671. He had married Dorothy Mileham in 1641, and his domestic letters that have been preserved give glimpses of a home-life of singular happiness. Of his twelve children, but one son and three daughters survived him. He died on the day on which he had completed his seventy-seventh year, 19th October 1682, and was buried in the church of St Peter's Mancroft, where his coffin was accidentally discovered by some workmen in 1840. The skull, which was well preserved, was 'knave'd out of his grave' and placed in the hospital-museum—a 'tragical abomination' that the men of Norwich might well have spared their greatest citizen.

Sir Thomas Browne's greatest work is his earliest, the *Religio Medici*, written about 1635 at Shipden Hall near Halifax, after his return from his travels, when his life was still a 'miracle of thirty years.' He tells us in the preface that it was composed 'at leisurable hours' for his 'private exercise and satisfaction,' and that 'the intention was not publick.' Two surreptitious editions published in 1642 obliged the author to issue an authorised edition in 1643. The book did not need Sir Kenelm Digby's 'observations' to make it at once famous if not popular. It was translated into Latin, and had the honour to be inserted in the *Index Expurgatorius*. Certain passages gave rise to much undeserved misrepresentation of its author's religious opinions, although, as Dr Johnson says, 'it is no difficult task to replace him among the most zealous professors of Christianity.' The book indeed is a kind of confession of faith, though it is more of a contribution to piety than to faith. It is the spiritual self-revelation of a nature of rare beauty and attractiveness, and the sympathetic reader is startled by occasional passages that reveal a depth of insight into the dim mysteries of the spiritual life that seems as unconscious as it is unexpected. 'Wingy mysteries in divinity and airy subtleties in religion' had ever a strange charm for the speculative side of Browne's intellect. He loves to abandon his mind to a full sense of the mysterious in religion. 'There are not impossibilities enough,' he says, 'in religion for an active faith. . . . I love to lose myself in a mystery, to pursue my reason to an *O altitudo!*' The book, moreover, reveals a lofty toleration for conditions of life and opinion widely different from the author's own, and a rare width of spiritual sympathy, extending even to virtuous heathens and to those ceremonies which 'misguided zeal terms superstition.' It is startling to find such a sentence as the following in a seventeenth-century writer: 'Persecution is a bad and indirect way to plant religion. It hath been the unhappy method of angry devotion.' Unfortunately, the clear-sighted thinker was not in all points before his time. He makes avowal here of his belief in the existence of witches, and a pitiful commentary on this was his opinion given at the request of the Lord Chief-justice, Sir Matthew Hale, during the trial of two women for witchcraft at Bury St Edmunds in 1664, which doubtless helped to send the unhappy victims to their doom.

Sir Thomas Browne's next work was *Pseudo-*

doxia Epidemica, or Enquiries into very many received tenets and commonly presumed truths, which examined prove but Vulgar and Common Errors (1646), a strange amalgam of humour, acuteness, and credulity. This is by far the largest and most elaborate of his works, yet even it is entirely discursive and occasional. It contains the most remarkable out-of-the-way learning, lightened up by grave humour; here and there a really acute scientific remark alternating with a laboured and serious discussion of such old popular opinions about natural objects as have long since passed into absurdities.

In 1658 appeared *Hydriotaphia; Urn Burial, or a Discourse of the Sepulchral Urns lately found in Norfolk*; and *The Garden of Cyrus, or the Quincuncial Lozenge, net-work plantations of the Ancients, artificially, naturally, mystically considered*. The former is mainly an elaborate discussion of the burial-customs in various countries at various times, showing all the author's vast and curious learning set in language of such rich and gorgeous eloquence that its splendid roll is not surpassed by the very loftiest passages in Jeremy Taylor or Milton. The echoes of the sombre and sonorous eloquence of its concluding chapter—a solemn homily on death and immortality—will never die away from the ear of a reader with any sense for the finest cadences of majestic and impassioned English.

The Garden of Cyrus is the most fantastic of Browne's writings. Its aim is to show that the number five pervaded not only all the horticulture of antiquity, but that it recurs throughout all plant-life, as well as the 'figurations' of animals. From the date of the above (1658) Sir Thomas Browne published nothing, but after his death appeared (1683) a collection of *Miscellany Tracts* under the editorship of Archbishop Tenison. These were reprinted in the folio edition of his works published in 1686. The *Letter to a Friend upon occasion of the death of his intimate friend* first appeared in 1690. Not a few passages in this work were worthy of the master's hand. In 1712 appeared *Posthumous Works of the learned Sir Thomas Browne*, containing some new papers, together with a reprint of the *Letter to a Friend*. The *Christian Morals*, an incomplete work, evidently intended to have been a continuation of the *Religio Medici*, was first published in 1716 by Archdeacon Jeffery.

Sir Thomas Browne's works are unsystematic and unequal—there is an unpremeditated desultoriness throughout that strikes an observant reader. His thought, no less than his style, is strikingly original, marked by high and occasionally transcendent intellectual power, often expressed with quaint humour or searching pathos, and always carrying with it a strange impressiveness. His favourite theme throughout all his books is ever the mystery of death and what lies beyond the grave, and the visible signs of mortality mean as much to him as they did to Shakespeare himself as a text from which to descant on what transcends the little sphere of human life. His style is too peculiar, idiomatic, and indeed difficult, ever to be generally popular, and it must be admitted that his studious brevity often falls pitifully into obscurity. In his own words, 'the quality of the subject will sometimes carry us into expressions beyond mere English apprehensions;' and indeed no writer has equalled him in the free coinage of Latinisms. Our language was then in a transition stage as a medium for expressing high thinking in prose, and some extenuation for his long and sonorous Latinisms may be found in the difficulty of finding at that period, alike in sound and sense, adequate English words for ideas so remote and extraordinary. It may be well for our language that such words

as *manuduction, supputation, assuefaction, magnalities, omniety, opiniouctry, and resipiscency* have never passed into general usage; but at least it cannot be denied that in Sir Thomas Browne's pages even these are rhetorically in perfect harmony with the thought, and help to give his rhythm that roll which resembles nothing so much as the sound of the distant sea breaking in long billows on the shore. Browne's influence on English literature has been deep, if not wide in extent. No writer bears the impress of his influence more strongly marked, alike in style and cast of thought, than Charles Lamb, who indeed boasts that he was the first 'among the moderns' to discover his excellencies. De Quincey ranks Sir Thomas Browne with Jeremy Taylor as the richest and most dazzling of rhetoricians, and Mr Lowell calls him 'our most imaginative mind since Shakespeare'; perhaps it is truer to say that his supremest merit rests in his being the highest type of the profound humorist, to whom 'all existence had been but food for contemplation.'

The only complete collection of Sir Thomas Browne's works is the monumental edition of Simon Wilkin (4 vols. Pickering, 1835-36), the labour of twelve years. Dr Greenhill's scholarly edition of the *Religio Medici* appeared in 1881. The best Life is still that by Dr Johnson, with Wilkin's 'Supplementary Memoir.'

Browne, ULYSSES MAXIMILIAN, COUNT, born at Basel, 23d October 1705, of an Irish Jacobite family, entered the Austrian service at the age of twelve, and became one of the foremost field-m Marshals in the army of Maria Theresa. As governor of Silesia (1739-42), he had to face the first of Frederick the Great's attacks, and in the Seven Years' War he commanded the Austrians at Lobositz (1756). He was mortally wounded at the battle of Prague, and died June 26, 1757.

Browne, WILLIAM, English pastoral poet, was born at Tavistock in 1591. He had his education at Exeter College, Oxford, was next a student at the Inner Temple, then tutor to Robert Dornier, the future Earl of Carnarvon. According to Wood he was taken into the household of the Herberts at Wilton, where he 'got wealth and purchased an estate.' But little is known of his life. He was living at Dorking about the close of 1640, and seems to have died about 1643. His great work was *Britannidia's Pastorals* (books i. ii. 1613-16; reprinted 1625). Browne here shows a fine descriptive faculty, and rich poetry gleams through his quaint and tedious allegorising. A third book was printed by the Percy Society in 1852, and by W. C. Hazlitt in his collective edition of Browne's works for the Roxburghe Club (2 vols. 1868). The only other work that needs mention is *The Shepherd's Pipe* (1614), a collection of eclogues. Browne was read by Milton and Keats, and himself was a devoted imitator of Spenser.

Brownian Movements. When small solid particles—e.g. of gamboge—suspended in water are viewed through the microscope, they are seen to be in incessant vibratory motion. The same movements are also manifested by microscopic germs, but are easily distinguished from those proper to the active state of these, there being no motion of translation in the former case. This observation was first made by the botanist, Robert Brown, whence the name. Its physical cause is somewhat obscure, but the late W. Stanley Jevons showed that these movements (for which he proposed the name *diapedesis*) varied greatly in proportion as the surface tension of the fluid was modified by the addition of other substances in solution. Soap greatly increases the amplitude of these vibrations, hence, according to Jevons, we have an at least

partial explanation of the facility with which it detaches foreign particles.

Brownie, a kind of domestic spirit in the folklore of Scotland, represented as a good-humoured drudging goblin, who attached himself to farm-houses and other dwellings in the country, and occupied himself over night, while the family were in bed, in doing any kind of work, as churning, thrashing corn, and the like. He was neither seen nor spoken to, but was known only by the obliging performance of his voluntarily undertaken labours, and his sole reward was a dish of cream left out for him. His services were much valued by good housewives, 'who,' says King James I., 'were so blinded as to believe that their house was all the souses, as they called it, that such spirits resorted there.' The resemblance of the Scotch brownie to the *Robin Goodfellow* of English, and the *Kobold* of German folklore is obvious, but perhaps they may be traced further to the *larcs* or hearth spirits of the ancients. The Russian *domovoy*, Mr Ralston tells us, lives behind the stove, and in some families a portion of the supper is always set aside for him; for if he is neglected he waxes wroth and knocks the tables and benches about at night. Spirits with the same functions elsewhere are the Lithuanian *kanka*, the Finnish *pauca*, and the French *lutin*.

Browning, ELIZABETH BARRETT, the most distinguished of modern poetesses, was born at Coxhoe Hall, Durham, March 6, 1806. Her father, Mr Edward Moulton, assumed the surname of Barrett on succeeding to estates in Jamaica. The family afterwards settled at Hope End, near Ledbury, in Herefordshire. Miss Barrett's childhood was nurtured amid beautiful scenery and the happiest of home influences. Her extraordinary talents were very early developed. At ten she was able to read Homer in the original, and at fourteen years of age she wrote an epic on *The Battle of Marathon*. About 1824 she seriously injured her spine, the result of an accident while endeavouring to saddle her horse. She was compelled for a long period to remain in a recumbent position. After her mother's death the family went to Sidmouth, and subsequently settled in London. Miss Barrett's *Essay on Mind, and other Poems*, was published when she was nineteen years of age. This was succeeded by *The Seraphim, and other Poems* (1835), in which volume was republished the fine poem on Cowper's grave. Shortly after this time she was taken to Torquay for the benefit of her health, and during her stay at that place a tragic incident occurred, which, in her own language, 'gave a nightmare to her life for ever.' Her brother Edward, who had gone down to see her, went out in a skiff with some friends, and the whole party were drowned in Babbicombe Bay. The shock was a terrible one for Miss Barrett, and even after her return to her father's town residence in Gloucester Place she remained an invalid, and was confined for many years to the sickroom. Her genius, however, was strongly fostered by her relative, Mr Kenyon. In 1844 appeared *Poems* by E. Barrett, which contained, amongst other stirring lyrics, *The Cry of the Children*, a noble outburst over the wrongs of young children employed in factories. Early in 1846 she first saw Robert Browning, whom she had described, when writing of himself and other poets, as a 'pomegranate which, if cut deep down the middle, shows a heart within, blood-tintured, of a veined humanity.' The two were married in the following autumn, and in consequence of her fragile health, Mr Browning immediately took his wife abroad. *Poems* by E. B. Browning appeared in 1850, containing new poems, and an

entirely new translation of the *Prometheus Bound* of Æschylus. This remarkable version testified to the learning as well as the genius of the translator. The Brownings settled in Florence, where a son, Robert Barrett, was born to them in 1849. While in Italy they were visited by many friends, Nathaniel Hawthorne, Walter Savage Landor, W. W. Story, and others, who were invariably struck by the sweet demeanour and pure and loving spirit of Mrs Browning. She was described as 'a soul of fire inclosed in a shell of pearl.' In 1851 Mrs Browning wrote her poem entitled *Casa Guidi Windows*, in which she expressed her earnest sympathy with the movement for the regeneration of Italy, her adopted country. George Eliot observed of this poem that, *inter alia*, it is 'a very noble expression of the true relation of the religious mind of the past to that of the present.' *Aurora Leigh*, published in 1851, the authoress described as 'the most mature of my works, the one into which my highest convictions of work and art have entered.' It is a bold, beautiful, and strikingly human poem, into which all the treasures of its writer's mind and heart have been poured. In her later works an added strength and impressiveness are to be found, the result of the influence of her husband. In *Poems before Congress*, which appeared in 1860, Mrs Browning again manifested her interest in public affairs, and especially in the development of Italian freedom. It was her deep feeling for the Italian cause which led her to hail Napoleon III. with admiration and enthusiasm as the liberator of the land of her adoption from the yoke of despotism. Mrs Browning died at Florence on June 30, 1861. The same month had witnessed the death of the great and patriotic statesman Cavour, and it is said that his end hastened her own. A tablet, voted by the municipality of Florence, with an inscription by Tommaseo, has been placed to Mrs Browning's memory on the walls of Casa Guidi.

In 1862 the *Last Poems* of the deceased were published by her husband. These posthumous effusions included several translations written in early life. Mrs Browning's *Greek Christian Poets and the English Poets*, also published posthumously by Mr Browning, appeared in 1863. The work consisted of prose essays and translations, originally published in the *Athenæum* in 1842. Since Mrs Browning's death, various selections from her works, and illustrated editions of certain of her poems, have appeared in England and the United States. The genius of this writer is incontestable. Her view of life was lofty and serene, and she has inscribed in immortal verse the highest and most sacred aspirations of the human heart. As a poet, her diction was at times splendidly fervid, and always musical and beautiful. She had a fine sensibility, an almost painful delicacy of perception, and a true woman's heart. Her *Sonnets from the Portuguese* are amongst the best love poems in the language. Her genius taken as a whole, but few of her sex approach her in strength, imagination, and knowledge. Her letters also, like her achievements in verse, were full of learning, of poetic fancy, and of spiritual insight. She has adorned English literature with poems which can never cease to be held in remembrance by a grateful and admiring posterity. See her *Letters to R. H. Horne*, edited by Mayer (1876).

Browning, ROBERT, the most subtle and intellectual of contemporary English poets, was born at Camberwell, May 7, 1812. His father, a man of parts, was engaged in the city of London. The future poet, after receiving a local education, attended lectures at University College, and then travelled abroad. From his earliest years he had been accustomed to write verse, and while still a youth, acquired the

triple reputation of poet, musician, and modeller. *Pauline*, a dramatic poem, written at the age of nineteen, was published in 1833. Two years later appeared his *Paracelsus*, which revealed a greater force. Its energy, its boldness of thought, its lofty aspirations, and its grip of human passion, stamped the author as one of the most promising of the younger poets. In 1837 he wrote (for Macready) his first tragedy, *Strafford*, but this and subsequent plays were not of the usual popular stage order. *Sordello*, which for its involutions of thought has given more trouble to Browning's readers than any other of his works, appeared in 1840. In it the author traces the development of a soul, following his hero (an Italian poet named by Dante) until his ambition closes in death. A series of plays, tragedies, and dramatic lyrics was issued under the collective title of *Bells and Pomegranates* (1841-46). The plays included *Pippa Passes*, *King Victor and King Charles*, and *Colombe's Birthday*; and the tragedies *The Return of the Drusus*, *A Blot on the 'Scutcheon* (produced at Drury Lane), *Luria*, and *A Soul's Tragedy*. Amongst the lyrics were *How they Brought the Good News from Ghent to Aix*, *Saul*, *The Lost Leader*, and *The Pied Piper of Hamelin*—poems which became, and still remain, the most popular of all Browning's writings. In these lyrical efforts the poet pressed into his service, in a masterly degree, humour, pathos, passion, and tenderness; while the whole were distinguished for their ringing and melodious versification. Browning married in 1846 Elizabeth Barrett Barrett, herself a poetess of high and noble gifts, and with her he went to Florence, where they lived for fifteen years in perfect and happy union. In 1850 Browning published *Christmas Eve and Easter Day*, poems which defend catholicity in religion, the good to be discovered in the varying forms of Christianity. *Men and Women*, which appeared in 1855, contained some of its author's finest work, including the stirring poems of *Fra Lippo*, *Childe Roland*, *Andrea del Sarto*, *Evelyn Hope*, *Holy Cross Day*, and *Up at a Villa*.

After the death of his wife in 1861, the poet settled permanently in London with his only son. *Dramatis Personæ*, issued in 1864, again attested the strength of Browning's dramatic gifts in monologue. These poems included *Abt Vogler*, *Caliban*, *A Death in the Desert*, and *Rabbi ben Ezra*, in which the writer unfolded his views upon music, philosophy, and the higher questions affecting life and immortality. Browning was elected an Honorary Fellow of Balliol in 1867. The same year he was made M.A. of Oxford, and at a later period received the honorary degree of LL.D. from Cambridge. Other distinctions of a similar character have also been conferred upon him. Browning's generally-accepted masterpiece, *The Ring and the Book*, was published in 1869. It is an epic dealing with the passions of humanity in a manner most searching and complete, and having for its basis the narrative of a murder by an Italian count, as related by the various persons concerned in the tragedy. The intellectual labour involved in this stupendous achievement, which embraces 21,116 lines, is immense, and there are many poetic passages scattered throughout the work which are as splendidly beautiful as anything that has been written in verse since the 16th century. *Hervé Riel*, a poem upon a French sailor hero, was published in 1871, the proceeds being given to the fund for the relief of Paris. From 1871 onward, works by Browning appeared in rapid succession. *Balaustion's Adventure* (1871), with the *Alkestis* of Euripides in an English dress, was the poet's first essay in Greek subjects; *Prince Hohenstiel-Schwangau, Saviour of Society*, dealt with the career of Louis-Napoleon; *Fifine at the Fair* (1872) handled a

question in morals very powerfully; *Red-cotton Night-cap Country* (1873) told the story of a famous Norman law case; *Aristophanes' Apology* (1875) was a second venture amongst the great Greek poets; *The Inn Album* (1875) was a graphic story of a deeply-wronged woman; *Pacchiarotto, and How He worked in Distemper* (1876), gave the author an opportunity of defending his poetic methods; the *Agamemnon* of Æschylus (1877) was a graphic transcript of that famous work; and *La Saisiaz, the Two Poets of Croisic* (1878), advanced a strong vindication of the faith in a future life. Two volumes of *Dramatic Idyls* (1879-80) may be described as vigorous character sketches, each idyl having a distinct and leading purpose. All are intense in their realism, and across the page constantly breaks the strong lightning flash of genius. *Jocoserie*, a volume containing a number of narrative poems, was published in 1883; and in 1884 appeared *Ferishtah's Fancies*, a work consisting of twelve poems, each dealing with some profound question touching the relations of man with the divine. *Parleyings with Certain People of Importance in their Day* was issued in 1887. Here again the author adopted his favourite method of developing through the medium of narrative his views upon important philosophical, literary, artistic, and other questions. The 'Browning Society' was established in 1881 for the purpose of promoting the study and influence of the poet's works, and the example of London has been followed by many other large centres in Great Britain, the colonies, and the United States. As a poet, Browning is distinguished for his capacity in the creation of real men and women, and also for the depth of his spiritual insight. His lyrical faculty, dramatic energy, and power of psychological analysis have rarely been equalled. Besides being one of the most erudite of poets, he has intense human sympathy and high imaginative gifts, and a profound and vigorous faith. His style is too frequently obscure and difficult, his versification hard and rugged, and his rhymes forced. Browning's son, R. B. Browning (born 1849), is a promising artist. On the 12th December 1889—the very day his last volume of poems, *Asolanulo: Fancies and Facts*, was published—Browning died at Venice; and he was buried in Westminster Abbey on the last day of the year.

See the *Browning Society's Papers*, Furnivall's *Browning Bibliography*, Mrs Sutherland Orr's *Handbook to Browning* (1885), with minor works by Symons (1887), Fotheringham (1887), and Sharp (1890); and the *Life by Mrs Sutherland Orr*. A uniform edition of his works (17 vols.) appeared in 1888-90, and a 2-vol. edition in 1896.

Brownists. See BROWNE, ROBERT.

Brown Pigments, mixtures of red and black, often containing also blue and yellow. Brown pigments (chiefly mineral, and used sometimes in a raw but usually in a burned state) include Caledonian brown, Cappah brown, amber, terra di sienna, Mars brown, Cassel earth, sepia, and brown madder. See GLASS, POTTERY, DYEING.

Brown-Séguard, EDOUARD, physiologist and physician, was born in Mauritius in 1818, his father being a sea-captain from Philadelphia, U.S., who married on the island a lady called Séguard. The son studied at Paris, and graduated M.D. in 1846. He devoted himself mainly to physiological research, and received numerous prizes, French and British, for the results of valuable experiments on blood, muscular irritability, animal heat, the spinal cord, and the nervous system. In 1864 he became professor of Physiology at Harvard, but in 1869 returned to Paris as professor of Pathology in the School of Medicine. In 1873 he became a medical practitioner in New York, treating specially dis-

eases of the nervous system; and in 1878 he succeeded Claude Bernard as professor of Experimental Medicine at the Collège de France. He has repeatedly lectured in England also. He has published lectures on *Physiology and Pathology of the Nervous System* (Phila. 1860), on *Paralysis of the Lower Extremities* (1860), on *Nervous Affections* (1873), and on the dual character of the brain. He died 1st April 1894.

Brownson, ORESTES AUGUSTUS, a versatile American writer, born at Stockbridge, Vermont, in 1803. In turn a Presbyterian, a Universalist, and next a Unitarian pastor, in 1844 he found rest in the Roman Catholic communion. Throughout his life he wrote with ability and warmth in defence of his opinions at the time, and took an active interest in social and political questions. His most important work was published in the *Boston Quarterly Review*, and afterwards in *Brownson's Review*. He died at Detroit, April 17, 1876. Among his books are *Charles Elwood, or the Infidel Converted* (1840), *The Spirit-rapper* (1854), and *The Convert* (1857), all with an autobiographic interest; and *The American Republic, its Constitution, Tendencies, and Destiny* (1865).

Brown Spar, a name often given by mineralogists to certain varieties of Dolomite (q.v.), or magnesian limestone, of not unfrequent occurrence, distinguished by a brownish or reddish colour, and a pearly lustre, upon account of which they are also sometimes called *pearl spar*.

Brownsville, a port of entry and capital of Cameron county, Texas, on the north bank of the Rio Grande, opposite Matamoros, about 35 miles from the mouth of the river in the Gulf of Mexico. It has a custom-house, and some river trade by steamers. The Rio Grande Railroad connects it with Point Isabel, 22 miles E., near the gulf. In May 1846 the town was occupied and fortified by a few United States troops, who maintained their position in the face of a heavy bombardment that lasted for 160 hours. Pop. (1870) 4905; (1890) 6134.

Broxburn, a mining and manufacturing village of Linlithgowshire, on the Union Canal, 12 miles W. of Edinburgh. It is chiefly notable for its shale-oil works. Those of the Broxburn Oil Company, built in 1878, employ about 1600 men, and turn out annually about 10,000,000 gallons of crude paraffin oil from the shale mined in the neighbourhood, besides paraffin candles, paraffin wax, sulphate of ammonia, and other bye-products. Pop. (1871) 1457; (1881) 3210; (1891) 5898.

Bruce, the surname of a family illustrious in Scottish history, descended from Robert de Bruis, a Norman knight, who accompanied William the Conqueror to England in 1066. The name, which is undoubtedly territorial, can probably be traced to the lands and castles of Bruis, near Cherbourg in Normandy. The first Robert de Bruis received extensive lands chiefly in Yorkshire. His son, the second Robert, was a companion in arms of Prince David of Scotland, afterwards David I., from whom he received a grant of the lordship of Annandale. At the commencement of the war in England between Stephen and Matilda, niece of the king of Scots, Robert de Bruis adhered to the former, and renounced his allegiance to David, resigning his lands in Annandale to his son Robert. In 1138 he was sent by the barons of the north of England to negotiate with David, who had advanced in support of his niece's claims as far as Northallerton, Yorkshire. In the battle of the Standard which followed, tradition relates that he took prisoner his son Robert, then fourteen years of age, who, as lord of Annandale, fought on the Scottish side. He died in 1141. His English estates were inherited by his eldest son, Adam, whose male line terminated in

Peter Bruce of Skelton, Constable of Scarborough Castle in 1271. Robert Bruce, second lord of Annandale, had two sons: Robert—who married a natural daughter of William the Lion, and died, without issue, before 1191—and William, whose son, Robert, fourth lord of Annandale, married Isabel, second daughter of David, Earl of Huntingdon and Chester, brother of William the Lion, and thus laid the foundation of the royal House of Bruce. He died in 1245.

ROBERT DE BRUCE, fifth lord of Annandale, son of the fourth lord above mentioned, and the competitor with John Baliol for the crown of Scotland, was born in 1210. On the death of his mother, the Princess Isabel, in 1251, he did homage to Henry III. for her lands in England, and in 1255 was made Sheriff of Cumberland, and Constable of the castle of Carlisle. About the same time he was appointed one of the fifteen regents of Scotland during the minority of Alexander III. In 1264 he led, with Comyn and Baliol, the Scottish auxiliaries to the assistance of the English monarch at the battle of Lewes, where he was taken prisoner, but released after the battle of Evesham, the following year. On the Scottish throne becoming vacant at the death, in 1290, of Margaret, the 'Maid of Norway,' granddaughter of Alexander III., Baliol and Bruce claimed the succession, the former as great-grandson of David, Earl of Huntingdon, by his eldest daughter, Margaret; the latter as grandson, by his second daughter, Isabel. Edward I. of England, to whom the dispute was referred, decided in favour of Baliol in 1292. To avoid swearing fealty to his successful rival, Bruce resigned Annandale to his eldest son, Robert Bruce, Earl of Carrick. He died at his castle of Lochmaben, Dumfriesshire, in 1295, leaving three sons and a daughter.

ROBERT DE BRUCE, Earl of Carrick, eldest son of the preceding, is said to have accompanied King Edward I. of England to Palestine in 1269, and was ever after greatly esteemed by that monarch. On his return to Scotland, he married, in 1271, Marjory, Countess of Carrick, and in her right became Earl of Carrick. In 1292 he resigned the earldom of Carrick to his eldest son, Robert, the future king of Scotland, then a minor. On the death of his father in 1295 he did homage to Edward for his English lands, and was appointed keeper of the castle of Carlisle, and in the following year, when Baliol renounced the authority of Edward, Bruce fought on the side of the English. After the battle of Dunbar, in which the Scots were defeated, and Baliol compelled to relinquish the sovereignty, he made application to Edward for the vacant crown, but was refused it. He afterwards went to live on his English estates, where he died in 1304.

ROBERT BRUCE, the most heroic of the Scottish kings, eldest son of the preceding, was born in 1274. In his youth he favoured the English interests, in the expectation, doubtless, of his father being preferred to the Scottish throne. In 1296, as Earl of Carrick, he swore fealty to Edward I. at Berwick, and the following year he renewed his oath of homage at Carlisle. Shortly after, he abandoned the cause of Edward, and with his Carrick vassals joined the Scottish revolt under Wallace. By the Capitulation of Irvine, however, Bruce speedily made his peace with the English monarch. In 1298, the year of the Scottish defeat at Falkirk, Bruce again rose against Edward. He had his lands wasted by the English, and he burned the town of Ayr. But Edward did not proceed to extremities against him. Though Bruce was one of the four regents of Scotland in 1299, he did not again fight against Edward till the final rising in 1306. But while publicly an adherent of the English king, Bruce had entered into

a secret alliance with Lamberton, Bishop of St Andrews, one of the most patriotic of the Scottish clergy. The decisive step was taken by the murder of Comyn at Dumfries. With John Comyn, called the Red Comyn, the nephew of Baliol, he seems to have entered into some agreement as to their rival claims to the throne. They met in the church of the Minorite Friars, Dumfries (10th February 1306); a quarrel took place; and Bruce, in a paroxysm of passion, stabbed Comyn with his dagger. Rushing out to his attendants, he exclaimed: 'I must be off, for I doubt I have slain the Red Comyn.' 'Doubt!' cried Kirkpatrick of Closeburn; 'I mak sikker!' (i.e. sure), and running into the church, despatched Comyn.

The motives and circumstances that led Bruce to the murder of Comyn are not quite clear, but the die was now cast. Bruce hastened to Lochmaben Castle, assembled his vassals, and asserted his right to the throne. Two months later, he was crowned king at Scone. An English army, under the Earl of Pembroke, nominated by Edward governor of Scotland, took possession of Perth, and surprised Bruce in the wood of Methven, compelling him to retreat into the wilds of Athole. At Dalry, near the head of Loch Tay, Bruce was attacked by Alexander, Lord of Lorn, chief of the Macdougals, the Red Comyn's uncle, and compelled to retire. Sending his queen and her ladies to Kildrummie Castle, Aberdeenshire, under the charge of Nigel Bruce and the Earl of Athole, Bruce continued his wanderings in the West Highlands, and then took refuge in the little island of Rathlin, on the north coast of Ireland, where he remained all winter, supposed to be dead. In his absence, the English took the castle of Kildrummie, hanged Nigel Bruce and other chiefs who had defended it, and tore the queen and Princess Marjory from the sanctuary of St Duthac, at Tain. All Bruce's estates were confiscated, and himself and adherents excommunicated by the pope's legate at Carlisle. In the spring of 1307 Bruce landed in Carrick, and at midnight surprised the English garrison in his own castle of Turnberry; but before a superior force he retired into the mountainous districts of Ayrshire. At London Hill in the same year he defeated the English under the Earl of Pembroke.

The death of King Edward in 1307 was the turning-point in the struggle of Bruce. In the following years the English were cleared out of the country and all the great castles recovered, with the exception of that of Stirling. It too was closely pressed by Edward Bruce, who entered into an arrangement with the governor, Sir Philip Mowbray, by which the latter bound himself to surrender it, if not relieved before 24th June following. This led to the memorable battle of Bannockburn (q.v.), 24th June 1314. The English, under Edward II., amounting, it is said, to about 100,000 men, were totally routed by Bruce with an army less than one-third that number. In 1317 Bruce passed over to Ireland to assist his brother Edward, elected king of that country, and defeated the Anglo-Irish at Slane, in Louth. In the year after Bannockburn the Scots repeatedly invaded England, taking the town of Berwick in 1318. The truce of 1323 for some time put a stop to the struggle; but on the accession of Edward III. in 1327 hostilities recommenced with a great Scottish inroad into the northern counties. The war was at last closed by the Treaty of Northampton (1328), recognising the independence of Scotland, and Bruce's right to the throne. His warfare was now accomplished, and suffering under the disease of leprosy, he spent the last two years of his life at Cardross Castle, on the northern shore of the Firth of Clyde. He died in

1329 in his fifty-fifth year, and the twenty-third of his reign. His heart, extracted and embalmed, was delivered to Sir James Douglas, to be carried to Palestine and buried in Jerusalem. Douglas was killed fighting against the Moors in Spain, and the sacred relic of Bruce, with the body of its devoted champion, was brought to Scotland, and buried in the monastery of Melrose. Bruce's body was interred in the Abbey Church of Dunfermline; and, in clearing the foundations for a third church on the same spot in 1818, his bones were discovered. He was twice married: (1) to Isabella, daughter of Donald, tenth Earl of Mar—issue, a daughter, Marjory, wife of Walter the High Steward, whose son ascended the throne as Robert II.; and (2) to Elizabeth, daughter of Aymer de Burgh, Earl of Ulster—issue, one son, who succeeded him as David II. (q.v.), and two daughters.

EDWARD BRUCE, king of Ireland, brother to the above, a chivalrous but rash and impetuous prince, was actively engaged in the struggle for Scotland's independence; and in 1308, after defeating the English twice, made himself master of Galloway. In 1315 the chieftains of Ulster tendered to him the crown of Ireland on condition of his assisting them to expel the English from the island. With a small army of 6000 men he embarked at Ayr, and reached Carrickfergus in that year, accompanied by Sir Thomas Randolph, Earl of Moray, and other Scottish knights of renown. His rapid victories soon made him master of the province of Ulster, and he was crowned king of Ireland in 1316, but was slain at the battle of Dundalk in 1318.

Bruce, JAMES, 'the Abyssinian,' was born at Kinnaird House, Stirlingshire, December 14, 1730. From Harrow he passed, in the winter of 1747, to the university of Edinburgh, with the intention of studying law; but changing his views, he went to London, and having, in February 1754, married the daughter of a wine-merchant's widow, became a partner in the business. His wife dying within a year, he made a tour on the Continent, and on his father's death in 1758 he succeeded to the estate of Kinnaird. In 1761 he retired from the wine-trade, and in 1763 was appointed consul-general at Algiers. He remained there about two years, studying the oriental languages, and acquiring the rudiments of surgery. He then went to Aleppo, where he took further instructions in the medical art, being resolved to travel in the character of a physician. In June 1768, he proceeded to Alexandria, and from Cairo set out on his famous journey to Abyssinia, which forms an epoch in the annals of discovery. Sailing up the Nile to Syene, he crossed the desert to Cosseir, and arrived at Jeddah in April 1769. After various detentions, he reached Gondar, the capital of Abyssinia, in February 1770; and on November 14 of that year, succeeded in reaching the sources of the Abawi, then considered the main stream of the Nile. This accomplishment of the chief object of his journey filled him with the greatest exultation. He remained about two years in Abyssinia, and returning by way of Sennaar and the desert of Assouan, after great hardship reached Alexandria, whence he embarked (March 1773) for Marseilles. In France he spent a considerable time visiting Buffon and other distinguished men, and in 1774 he returned to Scotland. His long-expected *Travels to Discover the Sources of the Nile, in the Years 1768-73*, were published in 1790, in five large quarto vols., with plates and charts. The work contained such curious accounts of the manners and habits of the people of Abyssinia that it startled the belief of many, and some of them were set down as fabrications. Among other doubters were De Tott in France, and Dr Johnson in England. Modern

travellers, including Pearce, Burekhardt, Belzoni, and others, have, however, testified to his general accuracy. Bruce died April 27, 1794, at Kinnaird, of a fall down-stairs.

Bruce, JOHN COLLINGWOOD, antiquary, born at Newcastle in 1805, graduated at Glasgow in 1826, and was trained for the Presbyterian ministry, but devoted himself to teaching. He was Moderator of the English Presbyterian Church in 1881. His works include *The Roman Wall* (1851; 3d ed. 1866); *The Bayeux Tapestry Elucidated* (1856); *Lapidarium Septentrionale* (1875), an account of all the Roman monuments in the north of England; and a *Handbook to the Roman Wall* (1863; 3d ed. 1885). He died 5th April 1892.

Bruce, MICHAEL, Scottish poet, was born 27th March 1746, at Kinnesswood, near the eastern shore of Loch Leven. A weaver's son, he tended sheep in his boyhood, but in 1762 was sent to Edinburgh University to study for the ministry. He had all his life to struggle with poverty; and after he left the university in 1765, and settled as a schoolmaster, first at Gairney Bridge, then near Tillicoultry, to poverty were added sickness and melancholy. He died of consumption, 5th July 1767, aged twenty-one. His tender and pathetic *Poems on Several Occasions*, seventeen in number, were published by the Rev. John Logan, his college friend, in 1770. The authorship of the *Ode to the Cuckoo*, and of some of his hymns, has proved a vexed question of literary controversy, Logan having been charged with appropriating poems by Bruce, and publishing them as his own. Logan's claim is defended by David Laing and J. Small (1873-78). Bruce's by Grosart (1865-86). See the *Life of Bruce* by Mackelvie (1837).

Brucea, a genus of Terebinthaceæ (q.v.), named after the famous Abyssinian traveller.—*B. antidysenterica* or *ferruginea* is an Abyssinian shrub, the leaves of which are said to be tonic, astringent, and useful in dysentery. Those of *B. sumatrana*, a native of the Indian Archipelago, China, &c., possess the same medicinal properties. They are intensely bitter, their properties resembling those of Quassia (q.v.).—The Abyssinian species acquired a factitious importance in the beginning of the 19th century, from a mistaken belief that it produced the dangerous False Angostura Bark (see ANGOSTURA BARK), and in this belief the name *Brucin* (q.v.) was given to an alkaloid really produced by the *Nux Vomica* (q.v.) and other species of *Strychnos* (q.v.).

Bruchsal, a town of Baden, on the Saalbach, 12 miles N.E. of Karlsruhe. The Old Town, around which are four suburbs, contains the castle of the prince-bishops of Spire, who resided here from the 16th century, and whose ancient tombs are pointed out in the church of St Peter. Bruchsal has a large prison organised on a modified form of the Pennsylvania system. Machinery, cigars, paper, and soap are manufactured, and there is an active trade in hops, tobacco, and corn. Pop. (1872) 9762; (1890) 11,909.

Brucin is one of the Alkaloids (q.v.) present in *Strychnos Nux Vomica*, and St Ignatius' bean, along with strychnine, &c. In action it resembles strychnine, but is only about one-twelfth of its strength, and on this account is seldom employed. It is mainly characterised by giving a blood-red colour with concentrated commercial nitric acid, and, indeed, the red colour always yielded by *nux vomica*, and occasionally by strychnine, when treated with nitric acid, is due to the presence of brucin. Brucin is capable of being converted into strychnine by heating it with five times its weight of dilute nitric acid, carbonic acid gas being given off.

Bruck, (1) a walled town, dating from the 3d century, on the Lower Austrian bank of the Leitha, 26 miles SE. of Vienna by rail, with a princely castle; pop. 4570.—(2) A town of Upper Styria, on the Mur, 108 miles SW. of Vienna by rail, with ironworks, &c.; pop. 5905.—(3) A market-town of Bavaria, 15 miles W. of Munich by rail, with the Cistercian monastery, founded in 1266, now used as barracks; pop. 3222.

Brückenau, a small town of Bavaria, on the Sinn, 17 miles NW. of Kissingen. The baths of Brückenau are picturesquely situated in the valley of the Sinn, about 2 miles from the town. The three warm springs are chiefly of use in nervous affections and cutaneous diseases. The grounds are tastefully laid out in gardens, and charming walks traverse the surrounding woods. The number of inhabitants (1549) is surpassed by that of visitors.

Brucker, JOHANN JAKOB, historian and biographer, born at Augsburg in 1696, studied at Jena, and became pastor at Augsburg, where he died 26th November 1770. A laborious and voluminous writer, he is chiefly remembered by his *Historia Critica Philosophiæ* (5 vols. 1742-44; new ed. 1767).

Bruges (Flem. *Brugge*), a city of Belgium, capital of the province of West Flanders, is situated in a fertile plain about 8 miles from the sea, with which it is connected by the three canals from Ghent, Sluys, and Ostend, the latter admitting ships of 500 tons. By rail it is 14 miles E. of Ostend, and 62 WNW. of Brussels. Bruges derives its name from its many bridges, all opening in the middle to admit of the passage of vessels. The inhabitants depend, nevertheless, for their supply of water principally upon rain-water, which is collected in large cisterns, public and private. The ramparts form an agreeable promenade, and the streets have a venerable and picturesque yet deserted aspect, the population being now scarcely a quarter of what it was during the middle ages. Among the most interesting buildings are Les Halles (1364), a cloth and flesh market, with the famous Belfry (q.v.); the Gothic hôtel-de-ville (1377), with a library of 100,000 volumes; the church of Notre Dame, with a spire 442 feet high, many valuable paintings, exquisite wood-carvings, a statue of the Virgin (said to be by Michael Angelo), and monuments of Charles the Bold and his daughter Mary, wife of the Emperor Maximilian; the cathedral of St Sauveur, with an ugly brick exterior, but a fine interior, containing the stalls of the knights of the Golden Fleece (q.v.); and St John's Hospital, with Hans Memling's masterpieces adorning the reliquary of St Ursula's arm. Bruges has manufactures of lace, woollens, linen, cotton, leather, soap, starch, and tobacco; and distilleries, sugar and salt refineries, and shipbuilding yards. During the 19th century its position on the railway and canal system has to some extent restored its commercial importance, and a ship-canal to Heyst is proposed. Pop. (1890) 47,497, of whom almost half are in extreme poverty, the excellent charitable institutions being accordingly heavily taxed. Dating from the 3d century, Bruges by 1200 was the central mart of the Hanseatic League; and a hundred years later it may be said to have become the metropolis of the world's commerce. Commercial agents from seventeen different kingdoms resided here, and no less than twenty ministers from foreign courts had mansions within its walls. Its population at this time amounted to upwards of 200,000. In 1488 the citizens rose in insurrection, and imprisoned the Archduke Maximilian, and with the harsh measures of repression which ensued commenced the commercial decline of Bruges. Many

of the traders and manufacturers, driven forth from their own country by the religious persecutions of the following century, settled in England, and brought with them their manufacturing superiority. In the 16th century, however, the tapestry of Bruges was still celebrated. Taken by the French in 1794, in 1815 the city became a part of the kingdom of the United Netherlands, and in 1830 of the Belgian monarchy. At Bruges lived John van Eyck (1428-41), Caxton (1446-76), and Memling (1477-94). See James Weale, *Bruges et ses Environs* (4th ed. 1887).

Brugg, a town in the Swiss canton of Aargau, on the right bank of the Aar, and near the mouth of the Reuss, 36 miles ESE. of Basel by rail. Near it is the site of *Vindonissa*, the chief Roman station in Helvetia; and it was also the cradle of the House of Hapsburg, whose ruined castle, founded in 1020, crowns a wooded height 2 miles from the village. Nearer is the abbey of Königsfelden (1310; converted in 1872 into an asylum), in the vaults beneath which are interred many of the members of the Austrian royal family. Pop. 1535. Zimmermann was a native.

Brugsch, HEINRICH KARL, an eminent Egyptologist, born at Berlin, February 18, 1827. At twenty-one he published a Latin treatise on the demotic writing, and gave such promise as soon gained him the favour of King Frederick-William IV., by whose aid he was enabled to visit the museums of Paris, London, Turin, and Leyden. In 1853 he first visited Egypt, and took part in the French archaeologist Mariette's great excavations at Memphis. He was called to the chair of Oriental Languages at Göttingen, but returned to Egypt in 1870 on the invitation of the viceroy to take charge of the School of Egyptology at Cairo with the rank of Bey, becoming pasha in 1881. In 1884 he went to Persia with the German embassy. He died 10th September 1894. Brugsch's works on Egyptology are numerous and of the first value. The chief are *Geographische Inschriften altägyptischer Denkmäler* (3 vols. 1857-60); *Geschichte Egyptens unter den Pharaonen* (1877; Eng. trans. 1879); *Hieroglyphisch-demotisches Wörterbuch* (7 vols. 1867-82); *Grammaire Hiéroglyphique à l'usage des étudiants* (1872); *Dictionnaire Géographique de l'Ancienne Egypte* (1877-80); *Thesaurus inscriptionum Egyptiacarum* (1882, et seq.); and *Religion und Mythologie der alten Egypter* (1884).

Brühl, a town of Rhenish Prussia, 8 miles SSW. of Cologne by rail. It has a splendid castle, erected in the early part of the 18th century by the Elector Clement Augustus of Bavaria, and restored by the King of Prussia in 1842. After his banishment from France in 1651, Cardinal Mazarin took up his residence in Brühl. Pop. (1885) 4030.

Brühl, HEINRICH, COUNT VON, prime-minister of Augustus III., king of Poland and Elector of Saxony, memorable among unworthy ministers and venal statesmen. He was born in 1700 at Weissenfels, and in early life entered, as a page, into the service of the Duchess of Saxe-Weissenfels. His winning address and tact gained for him rapid promotion through several offices of state, until, in 1746, he became prime-minister to that idle and unpatriotic ruler, Augustus III. With the basest and most slavish sycophancy, he humoured the whims of his unworthy master, draining the coffers of the state, and burdening the country with debt, to supply him with money to squander on his follies. Yet he contrived to enrich himself, and to accumulate honours and titles. He kept a horde of servants, and maintained the most splendid establishment in the kingdom. The effect of his reckless robbery of the national finances made itself felt at the outbreak of the Seven Years' War,

when the country could furnish only 17,000 men to oppose Frederick of Prussia, who surprised and captured the whole Saxon army in its camp at Pirna. Augustus and Brühl fled to Warsaw. When peace was concluded, they returned to Dresden, where Augustus died on the 5th October 1763. His worthless parasite had the grace to follow him three weeks later (28th October).

Bruise, or **CONTUSION**, signifies an injury inflicted by a blow or sudden pressure, in which the skin is not wounded, and no bone is broken or dislocated. Both terms, and especially the latter, are employed in surgery to include all such injuries in their widest range, from a black eye to a thoroughly crushed mass of muscle. In the slighter forms of this injury, as in ordinary simple bruises, there is no tearing, but only a concussion of the textures, the utmost damage done being the rupture of a few small blood-vessels, which occasions the discoloration that is always observed in these cases. In more severe contusions, the subjacent structures—muscles, connective tissue, vessels, &c.—are more or less ruptured, and in extreme cases, are thoroughly crushed, and usually become gangrenous. The quantity of blood that is extravasated mainly depends upon the size and number of the ruptured blood-vessels, but partly also on the nature of the textures of the injured part. Thus, a lax tissue, as that of the eyelids, favours the escape of blood into the surrounding parts. Moreover, the constitution of the patient has some influence, and many persons, especially, according to Paget, pallid, fatty, soft-skinned women, though suffering from no apparent disease, as well as those affected with scurvy or with the 'hemorrhagic diathesis' (see **HÆMOPHILIA**), are subject to extravasations, and consequently to discolorations, very disproportionate to the injuries that cause them.

The most characteristic signs of a recent contusion are more or less Shock (q.v.), pain, swelling, and discoloration of the surface from effused blood (commonly known as *Echymosis*, q.v.). There is nothing special in the character of the shock, but it is worthy of notice that it is most severely felt in injuries of special parts—as the testes, the breasts, and the larger joints, which are often followed by remarkable general depression, faintness, loss of muscular power, and nausea. The immediate pain following the blow is succeeded by a feeling of numbness, which, after a varying time, unless the part is killed, gives place to a heavy, aching pain. Although some depression may usually be observed immediately after the infliction of the blow, swelling of the parts rapidly follows, as may be well seen when a child receives a blow on the head, or in the wale that rises after the lash of a whip. In lax parts, such as the eyelids, the swelling is often considerable, and may remain for a week or more; but in other parts it usually subsides in two or three days. The discoloration of the skin consequent on blows is of a more or less purple tint, varying from black to crimson or pink. 'Blackness,' says Paget, 'usually indicating intense injury, is probably due to the extravasation of a large proportion of entire blood; crimson or pink tints, to the prevalence of a blood-stained fluid; blue, to the degrees in which blackness is veiled by the cuticle and skin, as the colour of blood in veins is; and perhaps some of the shades of pink to the partial aeration of the blood by the penetration of air through the epidermis. After a variable time, proportionate to the severity of the injury, these colours fade out, passing most commonly through gradually lightening shades of brownish olive, green, and yellow.' The causes of these changes of colour are not clearly known; as, however, the changes are not observed in bruises

of parts removed from air and light, they are probably due to oxidation and actinic agency. When a severe bruise tends to a natural cure, and there is no inflammation or sloughing, the effused blood is generally absorbed, the liquid portion rapidly disappearing, while the blood-cells are more slowly removed. In some cases, it is possible that the effused blood may become organised into vascular connective tissue, which takes part in the repair of the injured tissue. We need not follow the course of a bruise in which active inflammation with suppuration ensues, or in which sloughing takes place, as these complications must be treated according to the ordinary rules for those affections. There are, however, one or two ill consequences following partial recovery, which require notice. Thus, in some organs, as the breast, abscess may ensue long after a blow; or a sensitive indurated lump may remain; or (more commonly) there may be long-continued pain, without change of texture; or, lastly, cancer may ensue. Blows on superficial bones, as those on the skull, are not unfrequently followed by very painful thickening of the periosteum; a muscle violently struck may be paralysed, and rapidly waste away; and constitutional diseases, such as gout and rheumatism, are well known to localise themselves with special severity in parts that have once been seriously bruised.

With regard to treatment, simple and not very severe bruises require little treatment but the rest necessary for the avoidance of pain; but the removal of the swelling and discoloration may be hastened by the application of various local stimulants, which seem to act by accelerating the circulation through the bruised part, and promoting the absorption of the effused fluid. Friar's balsam, compound soap liniment, or poultices made with the roots of black bryony beaten to a pulp, are popular remedies of this class. Tincture of arnica has a great reputation; but experiments have made it very doubtful whether it is any more efficacious than simple spirit of the same strength. A solution of sulphurous acid, and hazeline and other preparations of the American Witch-hazel (q.v.), are of more value. They should be kept constantly applied to the bruised part on lint or cotton-wool. Pugilists, who are probably better acquainted with ordinary bruises than any other class of men, are in the habit of removing the swelling of the eyelids that often naturally occurs during a prize-fight to such an extent as to close the eyes, by at once puncturing the eyelids at several points with a lancet; and their favourite remedy for a black eye or other bruise on the face is a fresh beefsteak applied locally as a poultice. Bruises of a more severe nature, as when there is much breaking or crushing of the tissues, must, of course, at once be placed in the hands of a surgeon. See Sir James Paget on 'Contusions' in Holmes's *System of Surgery*.

Brumaire (Fr., 'foggy month'), a division of the year in the republican calendar of France. It includes the time from October 22 to November 20. The celebrated 18th Brumaire, which witnessed the overthrow of the Directory (q.v.) and the establishment of the sway of Napoleon, corresponds with November 9, 1799, of the Gregorian calendar.

Brummell, **GEORGE BRYAN**, better known as 'Beau Brummell,' was born in London, 7th June 1778, the son of Lord North's private secretary, and grandson of a gentleman's gentleman. At Eton, and during a brief sojourn at Oxford, he was less distinguished for studiousness than for the exquisiteness of his dress and manners; and after four years in the army, having come into a fortune of £30,000, he entered society on his true vocation of arbiter of elegancies. His success was brilliant;

but the pace was too hot, and his wit was, moreover, too fine for his twenty years' patron and admirer, the Prince Regent. They quarrelled in 1813, and gambling debts three years later forced Brummell to flee to Calais. He struggled on there, reckless as before, for fourteen years: from 1830 to 1832 held a sinecure consulate at Caen; and, after three years of drivelling imbecility, died in the pauper lunatic asylum of that old Norman city, 30th March 1840. See his Life by Jesse (1844; new ed. 1886).

Brunai, or BRUNEI, a British protectorate in the NW. of Borneo, till 1888 nominally an independent Mohammedan territory, whose sultan was formerly overlord of the whole island. Area, about 18,000 sq. m.; pop. estimated at 125,000, divided into trade castes. The capital, Brunai, on a river of the same name, is a miserable, dirty town, built on piles, with some 30,000 inhabitants, who trade with Singapore. See BORNEO.

Brunanburh, the scene in 937 of a bloody battle, in which Athelstan (q.v.) defeated an allied army of Welsh, Scots, and Danes. It is difficult to say whether Brunanburh was in Lothian, Northumberland, Yorkshire, at Brumby in Lincolnshire, or at Bromborough in Cheshire; and some have contended it was near Axminster in Devonshire. Of the Anglo-Saxon poem on the victory, preserved in the Anglo-Saxon Chronicle, there is a spirited version by Lord Tennyson.

Brunck, RICHARD FRANÇOIS PHILIPPE, classical scholar, was born at Strassburg, December 30, 1729. He was educated under the Jesuits in Paris, but abandoned his studies, and for some time was engaged as a military commissary during the Seven Years' War. A professor in Giessen, with whom Brunck happened to lodge while the army was in winter-quarters, revived in him the love of classical studies. Returning to Strassburg, he devoted all his spare time to Greek, and soon distinguished himself as an able but daring critic and emendator. His belief that all inaccuracies in ancient Greek writings were introduced by copyists often led him astray; but few critics since the revival of learning have done more for the progress of Greek literature. His first work, *Analecra Veterum Poëtarum Græcorum* (1772-76), was followed by editions of Anacreon (1778), Apollonius Rhodius (1780), Aristophanes (1781-83), *Poëte Gnomici* (1784), Virgil (1785), and Sophocles (1786). The outbreak of the French Revolution interrupted Brunck's studies. During the Terror he was imprisoned, but was liberated after the downfall of Robespierre. His means had been so much reduced, that he was compelled to sell his valuable library. He died June 12, 1803.

Brune, GUILLAUME MARIE ANNE, a French marshal of the First Empire, was born at Brives-la-Gaillarde, 13th March 1763. At first a Paris bookseller, he was a member of the Cordeliers' Club, and a friend of Danton. In 1792 he was sent as civil commissary to Belgium, but he soon entered the army, fought in the Vendean war and in Italy under Massena, and after Rivoli, was made general of division. Sent by the Directory to Switzerland in 1798, he executed his orders with brilliant success. In 1799 he was appointed to the command of the army of Holland, where he achieved the reputation of being one of the best generals of his age. He defeated the Duke of York at Bergen, September 19, and forced him to capitulate at Alkmaar. In 1803 he was ambassador to Turkey; next year he obtained the dignity of marshal. In 1807 he became governor-general of the Hanseatic towns, but soon exciting the distrust of Napoleon, was recalled. After the return from Elba he joined the emperor, was made a peer, but, like many better

men, had his prospects blasted by Waterloo. On 2d August 1815 he was brutally murdered by an infuriated royalist mob at Avignon. See his Life (Paris, 1821), and Conchard's monograph on Brune's murder (Paris, 1887).

Brunel, ISAMBARD KINGDOM, engineer, only son of the following, was born at Portsmouth, 9th April 1806, and in 1823, after two years spent at the college of Henri Quatre, in Paris, entered his father's office. He helped him in the construction of the Thames Tunnel, and himself, in 1829-31, planned the Clifton Suspension Bridge, which, commenced in 1835, was completed only in 1864 with the materials of his own Hungerford Suspension Bridge (1841-45) over the Thames at Charing Cross (see BRIDGE, p. 445). He designed the *Great Western* (1838), the first steamship built to cross the Atlantic, and the *Great Britain* (1845), the first ocean screw-steamer. The *Great Eastern* (q.v.), the largest vessel ever built in the world, was built under his sole direction in 1853-58. In 1833 he was appointed engineer to the Great Western Railway, and designed and constructed the whole of the tunnels, bridges, viaducts, and arches on that line. Among docks at English seaports, in the improvement or construction of which he was engaged, may be mentioned those of Bristol, Monkwearmouth, Cardiff, and Milford Haven. Made a Fellow of the Royal Society in 1830, he was chosen on the Council of the Institution of Civil Engineers in 1845, and its Vice-president from 1850. He died suddenly, 15th September 1859. See his Life by his son (1870).

Brunel, SIR MARC ISAMBARD, engineer, was born, a farmer's son, at Hacqueville, near Ronen, in France, April 25, 1769. He was destined for the church, but early showed an inclination for mechanics, and at school preferred the study of the exact sciences to the classics. In 1786 he became a sailor in the French navy. In the revolutionary period of 1793, having compromised himself by his political opinions, he escaped from Paris to the United States. His career as an engineer began in 1794, when he was appointed to survey for the canal which now connects Lake Champlain with the river Hudson at Albany. He afterwards acted as an architect in New York, for which city he was appointed chief-engineer, and erected an arsenal and cannon-foundry, with ingenious machinery for casting and boring. On his return to Europe in 1799, he married the daughter of William Kingdom, Plymouth, and settled in England. His mechanical skill was shown in various minor inventions, such as a writing and drawing machine, and a machine for winding cotton thread. A plan submitted by him to government for making block-pulleys for ships by machinery was adopted in 1803, and he was for many years employed in carrying it into execution in Portsmouth dockyard. On the completion of the machinery in 1806 the saving on the first year in the manufacture of the blocks was about £24,000. He received £17,000 from government as a reward for this invention. He was also successful in the construction of other public works—in Woolwich arsenal and Chatham dockyard, &c. He made experiments in steam-navigation on the Thames in 1812, but his proposals for the use of steam-tugs were declined by the navy board. The destruction of his sawmills at Battersea by fire (1814) led, with financial mismanagement, to his bankruptcy (1821), when he was thrown into prison for debt. He was released from prison on a grant of £5000 being made by government for payment of his debts. His most remarkable undertaking was the Thames Tunnel beneath the bed of the river, which, commenced in March

1825, was opened in March 1843. Assisted by his son, Isambard Kingdom Brunel, he for ten years pursued a course of experiments for employing carbonic acid gas as a motive power, but the cost of the machinery prevented its introduction as a substitute for steam. Among the less important of Brunel's inventions were machines for making wooden boxes; for ruling paper; for shuffling a pack of cards without using the hands; for the manufacture of nails; for making seamless shoes for the army; a knitting-machine; a preparation of tinfoil for ornamentation; and improvements in stereotype plates. Elected a Fellow of the Royal Society in 1814, he was appointed Vice-president in 1832, and was a member of various foreign societies. He was knighted in 1841; and died December 12, 1849, in his eighty-first year. See his *Life* by Beaumish (1862).

Brunelleschi, FILIPPO, one of the greatest Italian architects, was born at Florence in 1377. A goldsmith first, then a sculptor, he finally devoted himself to architecture, studying zealously perspective and geometry. At Rome he became imbued with classical traditions, and soon after his return to Florence in 1407, he offered his plan for completing the cathedral of Santa Maria del Fiore, founded in 1296, and now only wanting a dome. It was approved, spite of its boldness and novelty, but the work was not put into his hands till 1419. The great work was finished, all but the lantern, with which he intended to crown the whole, when he died at Florence in 1446. Brunelleschi's dome, measured diametrically, is the largest in the world, and served as a model to Michael Angelo for that of St Peter's. Besides this masterpiece he executed several other great works, such as the churches of Spirito Santo and San Lorenzo, as well as the designs for the Pitti Palace, which originated the beautiful style of Tuscan palace-architecture in the 15th century.

Brunhilda. (1) in the *Nibelungenlied*, the young and stalwart queen of Iceland, wife of Gunther, the Burgundian king. She hated passionately Kriemhild and her husband, Siegfried, who had once been her own lover; and she caused his murder by the hands of Hagen. Originally she was identical with the Norse Valkyrie *Brynhildr*, who for a fault was stripped of her divinity by Odin and sunk into a charmed sleep from which she was awakened by Sigurd (Siegfried). — (2) The daughter of the Visigothic king Athanagild, married King Sigibert of Austrasia in 567, and afterwards as regent for her two grandsons, Theodebert II., king of Austrasia, and Theodorik II., king of Burgundy, divided the government of the whole Frankish world with her rival Fredegond, who governed Neustria from the youthful Clotaire II. On the death of Fredegond in 598 she seized on Neustria, and for a while united under her rule the whole Merovingian dominions, but was overthrown in 613 by a combination in their own interests of the Austrasian nobles under the nominal leadership of Clotaire II., and put to death by being dragged at the heels of a wild horse.

Bruni, LEONARDO, a famous humanist, a native of Arezzo, and hence styled *Aretino*, was born in 1369. He first studied law at Florence and Ravenna, but afterwards turned his attention to classical literature. In 1405 he obtained the office of papal secretary, and as such served under four popes, the last of whom, John XXIII., he attended to the Council of Constance. On his patron's deposition he returned to Florence. His *Historia Florentina* procured for him the rights of citizenship, and at a later period, through the favour of the Medicean family, he was appointed state secretary. He died 9th March 1444. Bruni aided

in advancing the study of Greek literature mainly by his literal translations into Latin of Aristotle, Demosthenes, Plato, and Plutarch. Among his original works were *Commentarius Rerum suo Tempore Gestarum* (Ven. 1476), *De Origine Urbis Mantuae*, *De Romae Origine*, *Epistolae Familiares*, and *Lives of Petrarch and Dante* in the vernacular.

Brünig, a Swiss pass (3396 feet), forming the shortest and easiest route between the 'Forest Cantons' and the Bernese Oberland. A road was formed in 1857-62, and in 1888 a Brünig branch of the Berne-Lucerne Railway was opened.

Bruni Island (North and South) lies off the south part of the east coast of Tasmania, from which it is separated by D'Entrecasteaux Channel. It has a length of 32 miles, a varying breadth of 1 to 11 miles, and an area of 160 sq. m. Coal is mined.

Brünn, a city of the Austrian empire, the capital of Moravia, is beautifully situated, partly on the slope of a hill, and partly in a pleasant valley at the confluence of the Schwarza and the Zvittawa, 93 miles N. of Vienna by rail. Behind the city, on an eminence (984 feet), rises the castle of Spielberg, formerly the citadel, and now used as barracks, but notorious as the state-prison where Silvio Pellico was confined from 1822 to 1830. Surrounded by walls till 1860, Brünn possesses a steam-tramway and numerous other modern improvements. Among the most interesting buildings are the cathedral of St Peter; St James's Church, a Gothic edifice, with a tower 305 feet in height; the church of the Minorites; and the Augustine convent. The Stadttheater, opened in 1882, was the first continental theatre lit by electricity. Brünn is one of the most important manufacturing towns in the Austrian dominions. Its woollens are specially celebrated, and it has also large manufactures of machinery, linen, leather, paper, ironware, upholstery, liquors, and numerous chemical products. Pop. (1881) 82,660; (1890) 94,462 (40 per cent. Czechs).

Brunne, ROBERT OF, the name by which Robert Manning, a monk of the order founded by St Gilbert of Sempringham, is usually designated. His monastery was in South Lincolnshire, near the modern town of Bourn, and he lived in the reigns of Edward II. and Edward III., and probably died about 1340. His chief work is his *Handlyng Synne*, a free and amplified translation into English verse of William of Waddington's *Manuel des Pechiez*, with such judicious omissions and excellent additions as made his version much more entertaining than the original. The purpose of the book was to convey religious instruction to the people in the agreeable form of moral anecdotes. It is of great importance from the linguistic point of view as one of our best landmarks in the transition from the early to the later Middle English. He also made a new version in octosyllabic rhyme of Wace's *Brut d'Angleterre*, and added to it a popular translation of the French rhyming chronicle of Peter Langtoft of Bridlington. Robert deliberately wrote in English instead of French, in order to reach the common people, to give them the means 'for to haf solace and gamen, in telanschip when tha sit samen [together].'

Brunnen, a village, the port of the Swiss canton of Schwyz, on the Lake of Lucerne, near the mouth of the Muotta, 17 miles by water, but 28½ by rail ESE. of Lucerne. Here in 1315, after the battle of Morgarten, the deputies of the Forest Cantons formed a league.

Brunnow, PHILIPP, COMTE VON, a Russian diplomatist, was born at Dresden in 1797, and entered the Russian service in 1818. He was present in a civil capacity in the campaigns of

1828 and 1829 against the Turks, and in 1839 he was sent on a special mission to London, where, in the following spring, he was accredited as permanent ambassador. In this capacity he soon acquired distinction as a diplomatist. After retiring from London on the outbreak of the war in 1854, he represented Russia in Frankfurt, and, along with Count Orloff, was sent to the Conference of Paris in 1856. He was afterwards appointed to the court of Prussia; but in 1858 he returned to his old place in London, where he represented Russia at the conferences in 1864 and 1871. He was raised to the rank of count in 1871, and in 1874 retired to Darmstadt, where he died 12th April 1875.

Bruno. GIORDANO, a fervid, restless, profound philosopher, was born at Nola, in the kingdom of Naples, about the middle of the 16th century. He entered at an early age the order of the Dominicans, but soon began to express his doubts in regard to the doctrines of Transubstantiation and of the Immaculate Conception, in consequence of which he was obliged to flee from his convent. Henceforth his life was unsettled. In 1577 he went to Geneva, where he spent two years, but having excited the suspicion and dislike of the strict Calvinists of that city by his general scepticism, he judged it prudent to betake himself to Paris, where he delivered lectures on the 'Great Art' (Logic) of Raymond Lully. His disputes with the bigoted Aristotelians of the university of Paris compelled him, however, to leave France. He passed over into England, where he resided for two years in comparative quiet, enjoying the friendship of Sir Philip Sidney and the protection of the French ambassador, Michel de Castelnau. Here he composed his most important works, but at last, having incurred the displeasure of the clergy by his vehement denunciation of the Aristotelian philosophy and by other grave heresies, he returned to Paris in 1585. In 1586 he proceeded to the university of Marburg, where he matriculated, but was forbidden to lecture, and to Wittenberg, where he became professor. After spending some time in Prague, Brunswick, Helmstedt, and Frankfort-on-the-Maine, he resolved to go back to Italy. He fixed his residence at Padua; but venturing to settle in Venice, he was arrested by the officers of the Inquisition, and conveyed to Rome in 1593. He was now subjected to a long imprisonment and persecution, in the vain hope that he would recant; but when all the endeavours of his enemies proved ineffectual, he was brought to the stake, 17th February 1600, and burnt as a heretic. On the scene of his martyrdom, the *Campo dei Fiori*, a monument to his memory was unveiled in 1889. Two new editions of his works, one by Lagarde and one by Tocco and Vitelli, have been published.

Bruno's writings, of which the most valuable are composed in Italian, display throughout a strong, courageous, excitable soul, susceptible of deep enthusiasm, full of mental unrest and scepticism, but guided by an unsatisfied yearning for truth. His speculations are sublime. The *Cena delle Ceneri*, or Evening Conversations on Ash-Wednesday, is an apology for the Copernican astronomy; the *Spaccio della Bestia Trionfante*, or Expulsion of the Triumphant Beast (Paris, 1584), is a satirical and somewhat heavy allegory in the style of the times, but which perhaps gives the clearest account of Bruno's philosophy. His greatest works are metaphysical, such as the *Della Causa Principio ed Uno* (On the One Sole Cause of Things), and the *Del Infinito Universo e Mondi* (On the Infinity of the Universe and of Worlds). The doctrine enunciated in these is Pantheistic (see PANTHEISM). Bruno held that the infinite soul of God did not merely inhabit or pervade the

universe, but that the universe was simply a manifestation of Him, and therefore itself divine. God was therefore, in the most literal and physical sense, all in all. Bruno's philosophy, in later times, was quite unappreciated and even neglected, until Jacobi drew public attention to it in his *Letters on the Doctrine of Spinoza*. Both Spinoza and Descartes were much indebted to Bruno. His influence is also discernible in the speculation of modern Germany; one of Schelling's notable works is entitled *Bruno*. Original editions of his works are very rare. Those in Italian were published by Wagner in 1830; some Latin ones by Gfrörer in 1834. See works on Bruno by Bartholmæss (Paris, 1846), Berti (Flor. 1868 and 1880), Sigwart (Tüb. 1880), Brunnhofer (Leip. 1883), and the *Life of Giordano Bruno, the Nolan*, by Miss I. Frith, revised by Professor Moriz Carrière (Lond. 1887). The *Eroici Furori* was translated by L. Williams in 1888. A novel based on Bruno's life, by C. E. Plumptre (Lond. 1884), has slight value.

Bruno, St, the founder of the Carthusian order, was born at Cologne about 1040, and received his earliest education there. Subsequently he became rector of the cathedral school at Rheims. But the wickedness of his time soon began to weigh upon his soul, and in 1086, with six friends, he betook himself to the wild mountain of Chartreuse, near Grenoble. Here he founded the order of the Carthusians (q.v.), one of the most austere of all the monkish orders. Bruno and his companions had each a separate cell in which they practised the severities of the rule of St Benedict, keeping silence during six days of the week, and only on Sundays seeing one another. Pope Urban II., who was one of Bruno's most eminent scholars, in 1089 summoned the saint to Rome. He obeyed the call reluctantly, and steadily refused all offers of preferment. In 1094 he established a second Carthusian monastery at Della Torre, in a solitary district of Calabria, where he died in 1101. He was canonised in 1628; his festival is the 6th October. Bruno left no written regulations for his followers. These first appeared in a complete form in 1581, and were enjoined on all Carthusians by Innocent IX.

Bruno the Great, one of the most eminent men of his time, was born about 925, the third son of Henry the Fowler. He became archbishop of Cologne and chancellor of the empire under his brother Otto I., and afterwards, as a reward for his services, Duke of Lorraine. Distinguished alike for piety and learning, he strove to reform the monasteries and advance the love of learning among the clergy. He died at Rheims, 11th October 965.

Brunonian System. See BROWN, JOHN, p. 487.

Brunswick, DUCHY OF (Ger. *Braunschweig*), a state of Northern Germany, consisting of three larger and five smaller distinct parts, with a total area of 1423 sq. m. Pop. (1875) 327,493; (1890) 403,773. Of the three larger parts, the principal one, forming the circle of Wolfenbüttel, and including the capital, lies between Prussia and Hanover; the second, extending westward from Prussia to the Weser, divides Hanover into two parts; and the third, forming the Blankenburg district, lies to the south-east, between Hanover, Anhalt, and Prussia. The smaller parts are the isolated enclaves of Calvörde in the east, Thedinghausen in the west (not far from Bremen), and some very small demesnes on the Hanoverian boundaries. Brunswick belongs mostly to the basin of the Weser, which serves as a boundary on the west. Its surface is mostly mountainous, particularly in the southern portions of the country, but it has nevertheless level tracts of considerable

extent. The climate in the lowlands resembles the general climate of Northern Germany; but in the Harz district it is so much colder that harvest is generally a month later than in the plains.

The quarries and mines of Brunswick produce marble, alabaster, limestone, coal, iron, copper, lead, sulphur, alum, and salt in large quantities, with some little gold and silver. Agriculture constitutes the chief wealth of the duchy. The pasture-land is extensive, and great attention is paid to the rearing of cattle, and especially to the breeding of sheep, wool being an important article of commerce. A large number of persons are employed in the cutting and preparation of timber. The manufactures are comparatively unimportant.

The inhabitants are mostly Saxons, and with the exceptions of about 3000 Reformed, 16,000 Roman Catholics, and 1600 Jews, all adhere to the Lutheran Church. The people in the rural districts speak a very broad Low-German dialect; but good High-German is spoken by the educated classes. The government is a limited monarchy, the duke's power being restricted by the legislature. The annual revenue of Brunswick is about £700,000, and just balances the expenditure. The public debt amounts to a little over £3,000,000, mainly incurred for the formation of railways. The civil list is not comprised in the budget, being paid out of the revenues of the state domains and other funds—about £40,000 a year. The private estates of the dukedom of Brunswick are very large.

Brunswick was included as a part of Saxony under the empire of Charlemagne. In 1235, with Lüneburg, it was made a duchy under Otto, who died in 1252, and was succeeded in 1267 by his son, Albrecht, founder of the older line of Wolfenbüttel. John, another son of Otto, was the founder of the older Lüneburg line, which became extinct with William of Lüneburg in 1369. In 1569 Henry, who styled himself Duke of Brunswick-Lüneburg-Dannenberg, founded the new House of Brunswick-Wolfenbüttel; and his brother William founded the new line of Brunswick-Lüneburg, and as such became ancestor of the House of Hanover (q.v.). The ancient ensign of the race is the white horse. Duke Frederick-William came to England in 1809, and with his 'Black Brunswickers' (so called from their uniform, in mourning for the losses at Auerstadt) entered the English service, fighting in the Peninsular war till 1813, when he returned to his duchy; in 1815 he died a soldier's death at Quatre Bras. At the death of the childless Duke William in 1884, the succession passed to the Duke of Cumberland, son of George V., the deposed king of Hanover. As the heir refused to recognise the new constitution of the German empire, the imperial government declined to allow the succession to take place, and an interregnum occurred. In October 1885, Prince Albrecht, a nephew of the emperor, was elected regent of the duchy by the diet.

Brunswick, the capital, stands on the Oker, in a level and fertile district, 143 miles WSW. of Berlin. It is supposed to have been founded in 861, by Bruno, Duke of Ostfalen; but Henry the Lion, in the 12th century, so greatly strengthened and beautified the city that he may be almost said to be its founder. In the 13th century Brunswick became a member of the Hanseatic League, and soon attained considerable commercial prosperity, but its importance declined with the decay of the League. The town is most irregularly built, with narrow and crooked streets, but possesses the advantage of an abundant supply of water. The cathedral (1173-1469), and the churches of St Martin, St Catharine, and St Andrew with its steeple 341 feet high, are among the principal

buildings; the old Rath-haus is a fine specimen of Gothic, and a number of the older houses are interesting for their quaintly carved wooden fronts. In the museum are some notable antiquities and works of art by Jan Steen, Albert Dürer, Holbein, Rembrandt, Raphael, Guido, Ruysdael, Michael Angelo, and Benvenuto Cellini. The industry of the town consists chiefly in manufactures of jute, woollen and linen, leather, sewing-machines, chicory, beet-sugar, tobacco, *papier-mâché*, and lackered wares, and in publishing. The old fortifications have been demolished, and their site converted into pleasant promenades. A fine avenue of linden-trees leads to the ducal palace, which, destroyed by fire in 1830 and 1865, is now an imposing edifice of 1869. Pop. (1871) 57,833; (1891) 101,047.

Brunswick. (1) a port of entry and capital of Glynn county, Georgia, on St Simon Sound, an inlet of the Atlantic, 186 miles SE. of Macon by rail. It has connection by steamer with Savannah and New York, and exports cotton and timber; naval stores are manufactured. Pop. (1890) 8459.—(2) A town of Cumberland county, Maine, 29 miles NE. of Portland by rail, is at the head of navigation on the Androscoggin River, whose falls or rapids supply water-power for cotton, paper, and other mills. It is the seat of Bowdoin College (1794), a Congregational institution of high standing, at which Nathaniel Hawthorne and Longfellow graduated; it has 15 resident professors and about 250 students, and the Maine Medical School is affiliated to it. Pop. of township (1880) 5384; (1890) 6012.

Brunswick Black is a varnish employed for coating over coarsely finished iron grates, fenders, &c., and is prepared by melting together asphalt, linseed oil, and oil of turpentine. For finer work, it has been superseded by Berlin Black, a similar composition of finer quality.

Brunswick Green is a pigment used in the arts, the composition of which is very variable. The native varieties sometimes consist of carbonates of copper, but the artificial compounds frequently contain arsenite of copper, Prussian blue, indigo, or chrome yellow. A superior product is obtained by the action of sal-ammoniac on copper filings, an oxychloride of copper being produced identical with the mineral Atacamite (q.v.).

Brunswick. NEW. See NEW BRUNSWICK.

Brushes. Few things are in more universal use than brushes. One kind or another is to be found wherever people dwell or are at work. The materials used for the manufacture of brushes are, taking first those of animal origin, hog's bristles, horse-hair, strips of whalebone, and to a smaller extent goat's hair, badger's hair, fitch (polecat), sable and camel's hair. Those of vegetable origin are principally aloe fibre, called also Mexican fibre (*Agave americana*); Kittool fibre (*Caryota urens*); bass or piassaba fibre (*Attalea funifera*); and cocoanut fibre (*Cocos nucifera*). But many other vegetable fibres, as well as esparto grass and the like, are used locally for brushes or brooms in different parts of the world. Brushes of steel and brass wire are used for certain purposes.

For the stocks of the commoner kinds of brushes and brooms, native woods, such as sycamore (often called plane-tree), beech, elm, birch, chestnut, and oak, are employed, and ash for the handles of small brooms. Veneers or plates of rosewood and satinwood, of ivory, tortoise-shell, mother-of-pearl, xylonite, and silver adorn the backs and handles of toilet-brushes.

Bristles, though less so than they were, are still the chief material used in the manufacture of brushes. The chief sources from which they are

obtained are noted under BRISTLES. They are so far sorted into qualities when received by the manufacturers, who separate the larger and more valuable sizes by means of steel combs with one row of vertical teeth. The largest size stick in the teeth of the first comb, the next size in the second comb, and so on. Every bundle of the better qualities yields a small proportion of long and strong bristles which have a high value, and are not made into brushes but sold to shoemakers. The bristles are also sorted by hand and a size-stick or gauge into various lengths, and by the eye into various colours, as black, gray, white, and other shades. Either before or after they are sorted, bristles require to be washed, and the 'whites' are bleached with sulphurous acid or other agent (see BLEACHING). French white bristles are generally beautifully bleached.

A hair-brush may be taken as an example of how the class known as 'drawn' brushes are made. With the assistance of a perforated lead or wood

Fig. 1.

gauge the stock is drilled with holes for the tufts. These are formed by doubling the bristles, and are then drawn into their place by thin brass wire, which loops in tuft after tuft, and is continuous all through the filling of a single brush (see fig. 1, in which the bold line shows the wire). A back which conceals this wire-looping is then glued on and otherwise fixed. It may be stated that a hair-brush has the points of the bristles of unequal length, in order to penetrate the hair. Hat-brushes and baby's hair-brushes are made of horse-hair. The work of filling drawn brushes with bristles is very generally done by women working in their own homes.

Brooms, bannister, and other 'set' brushes, many of which have long tufts, are made in a different way. The stocks are turned, cut to shape, and drilled with holes of the proper size, but in this style of work they are only sunk to a certain depth. The root ends of the tufts, which are also the root ends of the bristles, if they are not doubled, are first dipped into melted brushmakers' pitch, next tied with a string at the root, and again dipped into the pitch; this fixes the tuft when pushed with a certain twist of the hand into one of the holes of the stock. In some cases the stock is twisted with one hand, and the tuft held steady by the other. In this manner the broom or brush is filled with bristles.

A painter's round brush or sash tool is one of the simplest kinds of brushes, and is made in one way by fixing a bundle or tuft of bristles, previously dipped into a cement formed of rosin and linseed oil, to the end of a two-pronged wooden handle by a piece of twine, which is then coated with glue. There are other methods of binding the bristles of large round brushes, such as by an iron or copper ring, or by wire.

Whitewash and other flat brushes of similar shape consist, in some cases, of two, three, or more cylindrical brushes, placed side by side, and fastened separately on a projecting edge of a flat stock or handle. Each of these single brushes forming the compound brush is bound with twine or copper wire, the latter being now preferred. There are other kinds of the same shape differently made; one variety, for example, is merely a single brush of oblong form with the bristles held together by a strip of leather and nails; another sort is formed by tufts fixed with pitch in the manner of a hearth-broom. In those cases where the root ends of the

bristles are exposed, they are singed with a hot bar of iron. It is curious how sometimes one, sometimes another kind of these brushes is preferred for the same purpose in different districts of the country. The brushes used by artists are, for large sizes, made of hog's hair bound with tin, and for small sizes of sable and camel hair. The latter are either bound with quill or tin. A sable-hair pencil is the most costly brush for its size that is made. Softening brushes of badger's hair are used both by artists and grainers of wood.

Machine-made Brushes.—There are several kinds of mechanism in use for making brushes. The Woodbury machine, which has been extensively used in America, is perhaps the best known. Its chief parts are a comb with an arrangement for filling its divisions with bristles; a shaft to work devices by which the bristles are fed in tufts to plungers that double them, bind them with wire, and introduce them into the back of the brush; an arrangement by which the wire is fed to and through the bristles after doubling; and mechanism for centring the brush-back under the two plungers concerned in preparing and inserting the tuft. The machine is too elaborate for illustration here. Fig. 2 shows how the tufts are bound with wire, which takes the form of a spiral, and by a movement of the plunger is made to screw its way into the hole in the brush-back.

Fig. 2.

In England, machinery is chiefly applied to the manufacture of the cheaper kinds of brushes from vegetable fibres, although it is not confined to these.

The fibres have to undergo a process of preparation. The tufts in these machine-made brushes are secured in different ways, such as by a cross wire, shown in fig. 3, or by a hard steel wire loop bent into a triangular shape, and placed as in fig. 4, with the shoulders pressed firmly on the sides of the drilled hole, and the points fixed to the bottom.

Brush Turkey. See MOUND-BIRDS.

Brussels (Fr. *Bruxelles*), the capital of Belgium, is situated in a fertile plain on the ditch-like Senne, 27 miles S. of Antwerp, and 193 NE. of Paris. It communicates by canal with the Scheldt, and so with Antwerp, and railways connect it with Germany, France, and Holland, as well as with all the principal towns of Belgium. The city has a circumference of about 5 miles, and is built partly on the side of a hill; though some of the streets are so steep that they can be ascended only by means of stairs, Brussels may on the whole be pronounced one of the finest cities in Europe. The Upper Town is the newest and most fashionable quarter, and is the residence chiefly of the great and wealthy. The king's palace, public offices, chief hotels, and mansions of foreign ministers are here. It is also much more healthy than the Lower Town, which is greatly subject to fogs, owing to its intersection by the canals and the Senne, although the stream now passes under an arched covering, which supports a new boulevard. But the closely built old streets, with their numerous handsome buildings, formerly belonging to the Brabant

nobility, but now occupied by merchants and traders, have a fine picturesque appearance, while some of the public edifices are unrivalled as specimens of Gothic architecture. This part has also several noble churches, but it is now wholly given over to trade. French is spoken in the upper division; but in the lower Flemish is prevalent, and in one quarter the Walloon dialect is spoken. The English language, owing to the large number of English who reside here for economy, is also very common. The walls which formerly surrounded Brussels have been removed, and their place is now occupied by pleasant boulevards extending all around the old town, and shaded by alleys of limes. The *Allée Verte*—a double avenue along the Scheldt Canal—forms a splendid promenade, and leads toward the country palace of *Lacken*, 3 miles north of the city. Besides the fine park in the Upper Town, covering an area of some 32 acres, ornamented with fountains and statues, and surrounded by the palace and other state buildings, Brussels has several other squares or places, among which the most noteworthy are: the *Place Royale*, with its colossal monument of Godfrey of Bouillon; the *Grand Place*, in which is situated the hôtel-de-ville, a splendid Gothic structure, erected in the beginning of the 15th century, with a spire of open stonework 364 feet high, and where, in 1568, the patriot counts, Egmont and Horn, were beheaded by order of the Duke of Alva; and the *Place des Martyrs*, where a memorial has been erected to those who fell here in the revolution of 1830. Among the churches the largest and finest is the cathedral of St Gudule, which dates from the 13th century, and is built in the pointed Gothic style, with many richly painted windows, and a pulpit considered to be the masterpiece of Verbruggen. In the *Palais des Beaux Arts* is the picture-gallery, containing the finest specimens of the Flemish school of painting; a valuable museum; and the public library, with 234,000 volumes and 22,000 MSS., many of the latter being beautifully illuminated. The observatory is well equipped. The new *Palais de Justice*, built in 1866-83 from designs by Poelaert at a cost of more than £2,000,000, is one of the most magnificent buildings in Europe. The royal palace and the national palace (for the chambers) are important buildings. There are several celebrated scientific societies, and educational institutions are both numerous and important. The university, founded in 1834, has over 1200 students. There are schools of painting and sculpture, and a conservatorium. The city contains also numerous charitable and benevolent institutions, and is the seat of the provincial government of South Brabant, as well as of the general government of the kingdom. Brussels is one of the chief centres of the industry of the country. Its lace is particularly famous. Of the esteemed carpets which pass under the name of Brussels carpets, only a few are manufactured here, most of those of Belgian make being produced at Tournai. It has also manufactures of damask,

linen, ribbons, embroidery, paper, jewelry, hats, soap, porcelain, mathematical and musical instruments, &c. Carriage-building is an important branch of industry; and printing and lithographic establishments are numerous. A great World Exhibition was held here in 1888. Pop. (1846) 123,874; (1866) 157,905; (1885) 171,751; (1891) with suburbs, 482,268.

As early as the 8th century, we find *Bruchsellæ*, then probably a villa of the Frank kings, mentioned in old chronicles; and that a church existed here in 966 is proved by a deed of the Emperor Otho I. Under Charles V. Brussels was made the court-residence in the Netherlands, and became afterwards, under Philip II., the chief arena of the revolution, and of the atrocities committed by the Duke of Alva and the Inquisition. The city suffered greatly in the war of Spain against Louis XIV.—in whose reign it was bombarded by Marshal Villeroi, and upwards of 4000 buildings destroyed

Palais de Justice, Brussels.

—and in that of Austria against Louis XV.; but still more from the continual prevalence of party animosities caused by the policy of Austria. Under the mild rule of Maria Theresa, it flourished greatly, and in this time many of its best institutions and public buildings were founded. In 1789 occurred the Brabant revolution under Joseph II.; and scarcely had Austrian rule been re-established, after a brief time of independence, when Brussels fell into the hands of the French (1792). After other changes of fortune, Brussels, with the other parts of Belgium, was incorporated with the kingdom of the Netherlands in 1815, and so remained until the revolution of 1830, by which it became the capital of the independent kingdom of Belgium.

Brussels Carpets. See CARPETS.

Brussels Sprouts, a sub-variety of *Brassica oleracea* (*B. O. bullata gemmifera*), so named on account of its peculiar habit, producing a bud-like cluster of leaves in the axil of each leaf from the base to the top of the stem. These buds or sprouts are the parts of the plant that are eaten, and are highly esteemed for their delicate flavour and wholesome quality. Brussels sprouts is one of the hardest of green winter vegetables, which, though chiefly cultivated in the gardens of the rich, is, on account of the great weight of crop it yields, and

its extreme hardness, worthy of a considerable space being devoted to it in the gardens of the poor. There are strains of the plant distinguished from each other by greater or less tallness of stem, and by the larger or smaller size and compactness of the sprouts. As a rule, the shorter stemmed strains have the largest and most compact sprouts, and are consequently the most favoured. The superior strains once obtained by seed-growers and by market-gardeners are very carefully selected for the purpose of producing seed, only those individual plants which present the most perfect points being reserved for seed production. As regards cultivation, the plant, like all of the cabbage tribe, requires deep rich soil to bring it to fullest perfection. The seed is sown in the open ground in February or March, according to the character of the weather, and again in the first week of April to prolong the succession of crops. Those sown in February will come into use in October or November, and the later sowings successively for about six months. Having comparatively little spread of leaves, the plants may be set more closely than most other Brassicæ, from eighteen to twenty-four inches apart each way being the usual distances allowed from plant to plant.

Brut, or **BRUTUS**, the eponymous Trojan hero who gave his name to the island of Britain, according to Geoffrey of Monmouth, Wace, Layamon, and all the earlier historians in verse or prose. The great-grandson of Æneas, he was banished from Italy, and after many adventures, found his way to Albion, then the abode of giants, who were not destroyed without desperate fighting.

Bruttium, the country of the Bruttii, anciently the name of the south-west peninsula of Italy. See CALABRIA.

Brutus, **LUCIUS JUNIUS**, in the legendary history of early Rome, the hero who overturned the monarchical and established the republican form of government. The son of a rich Roman, on whose death Tarquin the Proud seized the property and put an elder brother to death, he himself only escaped the same fate by feigning idiocy, whence the name *Brutus* ('stupid'). When the popular indignation was roused at the brutal outrage upon Lucretia, he placed himself at the head of the people, and drove the royal family from Rome. He was then elected one of the two first consuls (509 B.C.). With stern justice he sentenced to death his own two sons, detected in a conspiracy to restore the monarchy; and at last fell in mortal combat repelling an attack led on by one of the sons of Tarquin.

Brutus, **MARCUS JUNIUS**, born 85 B.C., appears to have spent the early years of manhood in exclusive devotion to literary pursuits, and not to have taken part in the political dissensions agitating Rome till he had attained a mature age. When the civil war broke out between Pompey and Caesar, he sided with the former, but after the battle of Pharsalia made his submission to the latter, and in the following year was appointed governor of Cisalpine Gaul. On returning to Rome he divorced his wife in order to marry Portia, the daughter of Cato, of whose principles in politics he professed to be a disciple. The influence of Cassius prevailed upon him to join the conspiracy which ended in the murder of Caesar (q.v.). The efforts of Brutus to retain popular favour afterwards being unavailing to counteract the effects of the eloquence of Antony, he was forced to leave first Rome, and then Italy. The remainder of his life was spent partly in Athens, partly in Asia Minor, and partly as the leader of a marauding force, which maintained itself by plundering the inhabitants of the eastern

shores of the Adriatic. Defeated at Philippi (42 B.C.; see **AUGUSTUS**), he fell upon his sword.

Brüx, a Bohemian town, 78 miles NW. of Prague; near are coal-mines, and the mineral springs of Seidlitz. Pop. 14,894, mostly Germans.

Bruyère. See **LA BRUYÈRE**.

Bryan, **WILLIAM JENNINGS**, was born at Salem (Ill.), 19th March 1860, studied at Jacksonville and Chicago, and practised as a lawyer in Nebraska. He was elected to Congress in 1890, and in 1896 and 1900 was chosen Democratic candidate for the presidency. He advocated free coinage of silver and governmental control of railways and monopolies, was the labour candidate as against capitalists, and in his second candidature opposed expansion or imperialism, but was even more completely defeated by McKinley (q.v.) in 1900 than in 1896.

Bryanites. See **METHODISTS**.

Bryant, **JACOB**, born at Plymouth in 1715, was educated at Eton and King's College, Cambridge, and in 1756 became secretary to his old pupil the Duke of Marlborough. He died 14th Nov. 1804. The chief of his many works is the *Analysis of Ancient Mythology* (3 vols. 1774-76), largely based upon the Abbé Banier.

Bryant, **WILLIAM CULLEN**, born of good New England stock at Cummington, Massachusetts, November 3, 1794, was trained to
Copyright 1888 in U.S.
admire the poetry of Pope, and by J. B. Lippincott
early encouraged to imitate him. Company.
The most noted fruit of these attempts was *The Embargo, a Satire by a Youth of Thirteen* (Boston, 1807). In 1810 he entered Williams College, but soon resumed his studies at home, and formed himself by loving study of such poets as his favourites, Blair and Kirke White, while watching with a keen eye the quiet life of nature as he rambled among the woods. His quickened imagination found expression in the majestic blank verse of *Thanatopsis*, which, published in the *North American Review* for September 1817, was at once acknowledged to surpass in grandeur and beauty anything previously written by an American. Meantime Bryant had studied law, had been admitted to the bar, and had settled at Great Barrington. Being called to contribute further to the *Review*, he sent both verse and prose; among the former *Lines to a Water-fowl*, and among the latter a criticism on American poetry. In 1821 he delivered before the Phi Beta Kappa Society at Harvard a poem in Spenserian verse called *The Ages*. In the same year he was married to Miss Frances Fairchild, who inspired his poem *O Fairest of the Rural Maids*; but he also lost his father, to whom he paid a tribute in his *Hymn to Death*. Other noted poems of this time are: *The Rivulet*, *The West Wind*, *Green River*, *The Forest Hymn*, and *June*, which were published in Boston periodicals. In 1825 the poet was induced by his friends to remove to New York to become editor of *The New York Review*, and when it failed a year later, he was made assistant-editor of the *Evening Post*. In 1829 Bryant became editor-in-chief, and by his ability, dignity, and steady adherence to principle, did much to raise the tone of the daily press. A collection of his poems was published in 1832, and, on its republication in England through Washington Irving, received favourable notice from *Blackwood's Magazine*. Bryant was now, however, absorbed in journalism. His paper was democratic in politics, but when the slavery question became prominent it inclined to the anti-slavery side, and in 1856 it assisted in forming the Republican party. As editor of an influential paper, Bryant was often called upon to make public addresses. A volume of

these addresses was published in 1873. His visits to Europe, the West Indies, and many parts of the United States, gave occasion for letters to his paper, which were republished, making three volumes. Meantime his poems had sunk deeply into the minds of his countrymen, and several editions, some of which were finely illustrated, were issued. In his old age, when relieved of the more pressing demands of a daily newspaper, he again permitted the deeper emotions of his heart to flow in verse. The poems of his age bear striking resemblance to those of his youth; they have the same grand simplicity, transparent clearness, wide generalisation. Sometimes, as in *Robert of Lincoln* and *The Planting of an Apple-tree*, he seemed to strike off a more airy and musical lyric than ever before. At seventy-two he commenced a translation of Homer's *Iliad* and *Odyssey* in English blank verse, which proved as inadequate as that of many greater men before him. Almost his last poem was *The Flood of Years*, a noble counterpart to *Thanatopsis*. On May 29, 1878, Bryant delivered an eloquent address at the unveiling of a bust of Mazzini, in Central Park, New York. After its close, as he was entering a house, he fell on the doorstep, receiving injuries of which he died June 12. His complete works were published in 4 vols. (1883-84); his Life was written by his son-in-law, Parke Godwin (2 vols. 1883), and other volumes relating to his life and works have been published.

Byrce, JAMES, author and politician, was born at Belfast, 10th May 1838, and educated at Glasgow University, and at Trinity College, Oxford, where he graduated in 1862 as double first. Called to the bar in 1867, he was in 1870-93 regius professor of Civil Law at Oxford, and entered parliament in 1880. In 1886 he was made Under-secretary for Foreign Affairs, and in 1892 Chancellor of the Duchy of Lancaster. A strong home-ruler, he has been active in connection with university reform, the Eastern question, commons and access to mountains, and copyright; and is author of *The Holy Roman Empire* (1864; 9th ed. 1888), *Transcaucasia and Ararat* (1877), *The American Commonwealth* (3 vols. 1888; new ed. 1890), and *Impressions of South Africa* (1897).

Brydges, SIR SAMUEL EGERTON, born at Wootton House, Kent, in 1762, was educated at Queen's College, Cambridge, and called to the bar in 1787, but retired a few years later to his books at his country house in Kent. He published poetry and novels, and seems from his *Autobiography* to have valued these much above their merits, while he speaks of his editorial labours as 'unworthy pursuits' that 'overlaid the fire of my bosom.' Much more valuable were his editions of Edward Phillips's *Theatrum Poetarum Anglicanorum* (1800); his *Censura Literaria*, containing *Titles, Abstracts, and Opinions of old English Books* (10 vols. 1805-9); and his edition of *Collins's Peccage of England* (9 vols. 1812). The claim of his family to the barony of Chandos broke down, but Brydges was gratified with a Swedish knighthood in 1808 and an English baronetcy in 1814. He represented Maidstone in 1812-18, and printed privately at the 'Lee Priory Press' small editions of many rare Elizabethan books and tracts. After 1818 he lived mostly abroad until his death near Geneva, 8th September 1837. His later bibliographical works were the *British Bibliographer* (4 vols. 1810-14); *Restituta* (4 vols. 1814-16); and *Excerpta Tudoriana* (2 vols. 1814-18). His *Autobiography* was published in 1834.

Bryennios, PHILOTHEOS, theologian, born at Constantinople in 1323, studied at home and in Germany, and presided over the great Greek school

in Constantinople from 1867 to 1874. He was one of two representatives of the Greek Church at the Old Catholic conference in Bonn in 1875, and while absent there was chosen Metropolitan of Serrae in Macedonia. In 1877 he was translated to Nicomedia. Bryennios is known as editor of the *Epistles of Clement* (q.v.) and discoverer of the *Didachē* (see APOSTLES, TEACHING OF THE).

Brynmawr, a place in Brecknockshire, 8 miles WSW. of Abergavenny, with ironworks; pop. 13,703.—For Bryn Mawr College near Philadelphia, U.S., see WOMEN'S RIGHTS.

Bryology, the study of Mosses (q.v.).

Bryony (*Bryonia*), a genus of Cucurbitaceae (q.v.), of which the Common Bryony (*B. dioica*) is the only British species. It is frequent in hedgerows in England, but becomes rarer in the north, and is not indigenous to Scotland. It has cordate palmate leaves, axillary bunches of flowers, and red berries about the size of a pea. It abounds in a fetid and acrid juice. The root-stock is perennial, very large, white and branched, has a repulsive smell, and is acrid, purgative, and emetic, owing to the presence of a bitter and poisonous

Common Bryony (*Bryonia dioica*):
a, flowering, and b, fruiting branch.

alkaloid, *brionin*. *B. alba*, which is monoecious, with black berries, is common in Central Europe, and possesses similar properties. The root of both is applied to bruises, was formerly in use as a purgative, and its tincture is still employed in homoeopathic and veterinary practice. The young shoots of both species are free from acrid and dangerous qualities, and are sometimes used as pot-herbs, especially in Eastern Europe.—The roots of other species of the genus are also acrid and purgative; and are used medicinally in India; but it is said that the root of *B. abyssinica*, when cooked, is eaten without danger.—*B. boykinii* is a species found native in the southern United States.—Black Bryony (*Tamus communis*) is a plant of a different natural order (Dioscoreae, q.v.). Its habit and distribution is similar to that of Bryony proper, but it may be readily distinguished by its simple entire heart-shaped leaves, which are smooth and somewhat glossy. The flowers are small and greenish, and the berries red, the root-stock very large and fleshy, black externally. The berries are unwholesome, and the whole plant is acrid, the roots so much so as to have been formerly employed for stimulating plasters. But the young suckers, in which the acrid principle is not

much developed, may be eaten like asparagus, after careful boiling with change of water.

Bryophyllum (Gr. *bryon*, 'blossom,' and *phyl-lon*, 'leaf'), a genus of Crassulaceæ (q.v.). *B. calycinum*, a succulent shrubby plant, a native of the Moluccas, with oblong, crenulated leaves, and large drooping panicles of greenish-yellow flowers, is not unfrequent in British and other hothouses, being regarded as an object of interest on account of its producing buds on the edges of the leaves more readily than almost any other plant, especially when the leaf is pegged down upon the soil, the buds then at once forming independent plants. The same habit is exhibited by the British Bog-orchis (*Malaxis paludosa*), by some species of ferns, &c. The leaves are valued for poulticing in the East. See BUD and LEAF.

Bryozoa. See POLYZOA.

Bryum (Gr. *bryon*, 'moss'), a large genus of common Mosses. They are all small, and generally grow in dense patches of a beautiful bright green. See MOSSES.

Brzesc. See BREST LITOVSK.

Brzezan. a town of Galicia, situated on the Zlota-Lipa, 52 miles SE. of Lemberg. It has manufactures of cloth, leather, meal, beer, and brandy. Pop. 11,221 (40 per cent. Jews).

Buache, PHILIPPE, a French geographer, born 1700, became in 1729 royal geographer, in 1730 a member of the Academy of Sciences; died in 1773. He published both atlases and geographical works. —His nephew, Jean Nicolas Buache (1741–1821), was also a celebrated geographer.

Buaze (*Securiduca* (*Lophostylis*) *longifolia* and *angustifolia*) is an Asclepiadaceous shrub found by Livingstone north of the Zambesi, where its twigs are employed as a source of fibre, which much resembles flax.

Bubalis, a genus in the Antelope division of hollow-horned even-toed Ruminants, not to be confused with the genus *Bubalus*—the Buffalo (q.v.). The species of *Bubalis* are among the more ox-like antelopes, and one of them is supposed to be the *Bubalus* of the ancients. In this genus the head is elongated, the snout broad, the horns twisted and present in both sexes, the tear-pits small, the back sloping off behind, the teats two in number.

Bubalis.

The Bubaline of the North African deserts (*B. mauritanica* = *Antelope bubalis*) is a handsome animal of a reddish-brown colour, standing about 5 feet high at the shoulder, living in herds, and readily tamed. It is figured on Egyptian monuments. The Hartbeest (*B. caama*) is found in

the south, is perhaps slightly larger, has a general gray-brown colour (black on the outside of the legs and on middle of forehead, with large white spots on hanches), and is at home on the mountains. The Sassaaby (*B. luanda*), the Bastard Hartbeest of the Cape Colonists, is slightly smaller, and is differently coloured. The Bontebok (*B. pygarga*) is a smaller and more beautifully coloured form of the southern interior, where another species, the violet-coloured Blesbok, is also abundant. See ANTELOPE.

Bubastis (the *Pi-beseth* of Ezek. xxx. 17; now *Tel Bast*), a ruined city of Lower Egypt, on the eastern main-arm of the Nile, near Zagazig, named from the lion-headed and cat-headed goddess Bast, who was worshipped here with peculiar reverence. She was daughter of Ra, and bride of Ptah, and symbolised sexual passion. Her festival took place on the 16th of Khoiak (about Christmas). Bast (also called *Menk*) and Sekhet were regarded as sisters. Under the 25th dynasty (725–686 B.C.) the city was a royal residence, but after the Persian conquest (352 B.C.) it gradually lost its importance. The ruins of its great temple were discovered by M. Naville in 1887, and extensive excavations next year revealed that Bubastis was once the seat of a great Hyksos settlement.

Bubble Shell. See BULLA.

Bubo. See OWL.

Bubo, an inflammatory swelling of the glands in the groin; used occasionally also of the armpit. See GONORRHEA and INFLAMMATION.

Buccaneers (through the Fr. verb *boucaner*, and noun *boucanier*, from Caribbean *boucan*, 'smoke-dried meat'), a name given to the celebrated associations of piratical adventurers, who, from the commencement of the second quarter of the 16th century to the end of the 17th, maintained themselves in the Caribbean seas, at first by systematic reprisals on the Spaniards, latterly by less justifiable and indiscriminate piracy. The arrogant assumption by the Spaniards of a divine right to the whole New World, and their consequent exclusive monopoly of trade, could not of course be tolerated by the enterprising mariners of England and France, who began to band themselves together for mutual defence, and for the plunder of the common enemy. In 1625 an attempt was made to found a settlement on the island of St Christopher as a centre of smuggling enterprise with San Domingo, and in 1630 the small island of Tortuga was seized and converted into a stronghold. From this the buccaneers made their incursions against the Spaniards, and here they stored the gains of their roving adventurous life. Their earlier history shows that they had a rude honour and fidelity in their relation with one another, which attracted to their flag hundreds of adventurous spirits from every European trading nation. Tortuga was taken and retaken by the Spaniards, but the capture of Jamaica in 1655 finally gave the buccaneers a surer footing. Their power had now become considerable, and their seamen were as famous for their desperate courage as for their consuming hatred of the Spaniards. Their history embraces narratives of cruelty and bloodshed hardly to be surpassed in the annals of crime, but is brightened by many a story of high and romantic adventure, of chivalrous valour, and brilliant generalship. Among the 'great captains' whose names figure most prominently in the records of buccaneering were the Frenchman Montbars, surnamed by the terrible title of 'The Exterminator'; Peter of Dieppe, surnamed 'The Great'—as truly, perhaps, as many others so distinguished; L'Olonnois; Michael de Buseo and Bartolomeo de Portugalvez; Mansvelt, and Van

Horn. Pre-eminent, however, among them all was the Welshman, Henry Morgan, afterwards knighted by Charles II. and made deputy-governor of Jamaica, a man of rare capacity and courage. He it was that led the way for the buccaneers to the Southern Ocean, by his daring march in 1671 across the Isthmus of Panama to the city of that name, which he took and plundered after a desperate battle. In 1680 they crossed the Isthmus of Darien and seized some Spanish vessels in the Bay of Panama, after which some returned, but others cruised for months through the South Sea, coming back with enormous wealth to the West Indies by Cape Horn. Other expeditions followed, whose ravages almost paralysed the Spanish trade in the Pacific. In 1685, when their fleet defied the Spanish power in the Bay of Panama, their glory was at its height. The strange confederacy now began to fall to pieces under the jealousies that grew up with wealth and greater security: and the next stages in their history are disunion, decay, and extinction. The war between France and Britain, after the accession of William III., dissolved the ancient alliance of the French and English buccaneers. After the Peace of Ryswick, and the accession of the Bourbon Philip V. to the Spanish crown (1701), the buccaneers finally disappeared to make way for a race of mere cut-throats and vulgar desperadoes, who lacked the greatness of their predecessors. The last event in their history was the capture of Cartagena in 1697, where the booty was enormous. See Dampier's *Logues*; the *Narratives of Wafer, Ringrove, and Sharp*; Captain Burney's *History of the Buccaneers of America* (1816); Thornbury's *Monarchs of the Main* (1855); *Les Flibustiers au XVII. Siècle* (1884); Powell's edition (1893) of Esquemeling's *Buccaneers of America*.

Buc'cari, or BAKAR, a small port of Croatia, on an inlet of the Gulf of Quarnero, 5 miles by rail ESE. of Fiume. Pop. 2000.

Buccinator (Lat. from *buccinare*, 'to sound a trumpet'), the name of a flat muscle in the cheeks, so called because, when the cheeks are distended with air, the contraction of the buccinator muscles forces it out.

Buc'cinum. See WHELK.

Buccleuch, a small Selkirkshire glen, 18 miles SW. of Selkirk, with the site of an early stronghold of the Scotts, to whom it gave the title of earl (1619) and duke (1663). See SCOTT.

Bucen taur (Ital. *bucentoro*), the name of the state-galley in which the former Doges of Venice used to sail out every year on Ascension-day, amid great festivities, in order, by sinking a ring into the sea, to wed it in token of perpetual sovereignty. The word signifies a monstrous figure of half bull, half man, such as may originally have been depicted on the vessel. The ceremony was already in use in the 13th century; in 1798 the last Bucen taur, built in 1722-29, was burned by the French, but some portions, spared for their gold work, are still preserved in the arsenal.

Buceph'alus (Gr., 'ox-head'), the name of the favourite charger of Alexander the Great, was probably also the name of a peculiar breed of horses in Thessaly. The young hero was the first to break in the steed, and thus fulfilled the condition stated by an oracle as necessary for gaining the crown of Macedon. The town BUCEPHALIA, on the river Hydaspes (Jhelum), in India, was founded near the grave of Bucephalus, who died during Alexander's Indian expedition.

Bucer, or BUTZER, MARTIN, reformer, was born in 1491 at Schlettstadt, in Alsace. At the age of fourteen he entered the Dominican order, and

went to Heidelberg to study theology, Greek, and Hebrew. In 1521 he quitted the order, and was appointed chaplain to the Elector-Palatine, an acquaintance with the works of Erasmus having already inclined him towards Protestantism. He married a former nun in 1522, and next year settled in Strasburg. In the disputes between Luther and Zwingli, Bucer adopted a middle course, and endeavoured to reconcile them; but his view of the sacraments, which approached that of Zwingli, exposed him to Luther's harsh reprobation. At the Diet of Augsburg, where he conducted himself with great circumspection and moderation, he generally accorded with the Lutheran views, but, along with other Strasburg theologians, declined to subscribe to the proposed confession of faith, and afterwards drew up the *Confessio Tetrapolitana* (1530). At Wittenberg, however, an agreement was in 1536 entered into between Bucer and the Lutherans. In consequence of his refusal to sign the *Interim* (q.v.) in 1548, Bucer found his situation irksome in Germany, and therefore accepted Cranmer's invitation (1549), and came to England to teach theology at Cambridge, and assist in forwarding the Reformation. His modesty, blameless life, and great learning gained many friends in England; but his labours were soon terminated by death, February 27, 1551. His remains were interred in St Mary's, Cambridge, with great solemnity, but during Mary's reign were exhumed and burned in the market-place. Bucer's constant attempts to express himself in language agreeable both to Luther and Zwingli, induced in him at times an obscure and ambiguous style, and Bossuet stigmatised Bucer as 'the great architect of subtleties.' His work, a translation and exposition of the Psalms, he published under the pseudonym Aretinus Felinus (1529). Lenz has edited (1880) his correspondence with the Landgrave of Hesse, whose 'second' marriage Bucer defended. See Baum, *Cypito und Bucer* (1860); Tollin, *Servet und Bucer* (1880); and a long article by Professor Ward in the *Dictionary of National Biography* (vol. vii. 1886).

Buceros. See HORNBELL.

Buch, LEOPOLD VON, German geologist, was born at Schloss-Stolpe, near Angermünde, in 1774, and received instruction under Werner at the Mining Academy, Freiberg. He afterwards travelled in pursuit of his favourite science, through all the states of Germany, through Scandinavia as far as the North Cape, and through several parts of Great Britain, France, and Italy, visiting the Canary Islands in 1815. He strenuously upheld the now exploded theory of 'Elevation Craters,' according to which volcanic mountains have been formed by a single sudden swelling-up into a hollow bladder of previously existing horizontal beds of lava and scoria. He died in Berlin, March 4, 1853. His collected works fill 4 vols. (1867-85).

Buchan, the north-east district of Aberdeenshire (q.v.), lying between the Ythan and the Deyeron. It rises in Mormond Hill to 769 feet; portions of the coast are bold and precipitous, and 6 miles south of Peterhead are the famous Bullers of Buchan, a huge vertical well in the granite margin of the sea, 50 feet in diameter and 100 feet deep, into whose bottom the sea rushes by a natural archway. Buchan contains the towns of Peterhead, Fraserburgh, Macduff, and Turriff, besides the remains of the Abbey of Deer, and of several castles of the Comyns, who held the earldom of Buchan, but forfeited their title and property in 1309. See Pratt's *History of Buchan* (Aberdeen, 1859). Buchan Ness is the easternmost promontory of Scotland, 3 miles S. of Peterhead.

Buchan. DAVID, explorer, born in 1780, held a lieutenant's commission in the British navy in 1806, and in 1810 was in command of a schooner on the Newfoundland station. He explored the river Exploit (1811), and penetrated 160 miles into the interior. Promoted commander in 1816, he was two years later appointed to the command of a Polar expedition, at the same time as Ross and Parry started on their voyage in search of a north-west passage. Buchan reached Spitzbergen with the *Dorothea* and *Trent*, but all attempts to pierce the gigantic icy barrier were in vain. On his return he commanded for a time on the Newfoundland station, was appointed high-sheriff of Newfoundland (1825), and a few years later sailed on another voyage to northern waters, from which he never returned. His name was removed from the list of living captains in 1839.

Buchan. PETER, an industrious collector of Scottish ballads, was born at Peterhead in 1790. At twenty-four he published an original volume of verse, next taught himself copper-engraving, and after learning the art of printing at Stirling in ten days, set up a press at Peterhead (1816). He afterwards removed to London, but returned after two years to Peterhead, where by his business he made money enough to buy a property in Stirlingshire. He died in London, September 19, 1854. Buchan's *Ancient Ballads and Songs of the North of Scotland* was published at Edinburgh in 1828. It contained about forty new ballads, and many fresh versions of ballads printed elsewhere. A second collection was edited for the Percy Society in 1845 by J. H. Dixon. Buchan wrote many books, among them *Annals of Peterhead* (1819), and *The Eglington Tournament and Gentleman Unmasked* (Glasgow, 1839).

Buchan. WILLIAM, physician, was born in 1729 at Ancrum, Roxburghshire, and studied divinity and medicine in Edinburgh. He settled in Sheffield, but removed to Edinburgh about 1766, where he practised and lectured on natural philosophy. His *Domestic Medicine*, perhaps the most popular book of its kind ever issued, appeared in 1769. Its success was great and immediate, 19 large editions, amounting to 80,000 copies, being sold during Buchan's lifetime. He removed to London in 1778, where he died, and was buried in Westminster Abbey. Buchan was also author of works on *Cold Bathing* (1786), *Diet* (1797), and *Offices and Duties of a Mother* (1800).

Buchanan. CLAUDIUS, born at Cambuslang, near Glasgow, 12th March 1766, studied for two years at Glasgow University, and afterwards, through the influence of the Rev. John Newton, at the university of Cambridge (1791-95). From 1797 he was a chaplain in the East India Company's service at Barrackpur, where he studied Hindustani and Persian; in 1799 he removed to Calcutta, and became vice-provost of the college founded by Lord Wellesley at Fort William. He translated the Gospels into Persian and Hindustani, and made two tours through southern and western India; but debarred as a chaplain from directly engaging in missionary enterprise, he returned in 1808 to England. There, by his sermons and his periodical, *The Star of the East*, he excited so much popular interest that the government took his side, and before his death, February 9, 1815, the first English bishop had been appointed to Calcutta. See his *Life* by Pearson (3d ed. 1819). His *Christian Researches in India* was published in 1858.

Buchanan. GEORGE, the most distinguished scholar whom Scotland has produced, and one of the most brilliant representatives of the intellectual and religious movements of his age, was born of parents poor, but of good descent, at

Killearn, in the county of Stirling, in February 1506. Buchanan received the rudiments of his education in Scotland; but at the age of fourteen was sent by an uncle to the university of Paris, where his chief study was the composition of Latin verse. The death of this uncle who had supported him, as well as the state of his own health, forced Buchanan at the end of two years to return to Scotland. After nearly a year's illness, he enlisted in a force led by the Duke of Albany against England; and from the hardships of this campaign his health again suffered severely. In 1524 he matriculated as a *pauper* student at St Andrews, and the next year took the degree of B.A. In 1526 he returned to France, took the degree of M.A. at the Scottish College of Paris, and after two years' great privations, was appointed professor in the college of Ste Barbe. About this time, also, he was engaged as tutor to the son of the Earl of Cassilis; and on his pupil's return to Scotland, probably about 1535, Buchanan accompanied him. On the termination of this engagement, he was intrusted by James V. with the education of one of his illegitimate sons. To this period belong Buchanan's two satires against the Franciscans, the *Somnium* and *Franciscanus*, the latter prompted by the king himself, who, nevertheless, was either unable or unwilling to shield Buchanan from the anger of the monks. At the instance of Cardinal Beaton, Buchanan was imprisoned in the castle of St Andrews; but, having made his escape, he fled to England, whence, after a short stay, he proceeded to Paris (1539). Finding Beaton here, he hastened to Bordeaux on the invitation of André de Gouvêa, the head of the college in that city, and in that college acted as one of the professors for the next three years. During his stay here, Buchanan wrote and translated several plays, mainly with the object of weaning the tastes of the students from the allegorical representations so popular at that time. After leaving Bordeaux in 1542 on account of the plague, he seems for some years to have held the position of professor in the college of Cardinal le Moine, at Paris. In 1547, again through Gouvêa, he was appointed professor in the newly-founded university of Coimbra, in Portugal. Gouvêa, however, dying shortly afterwards, the authority of the Romish Church subjected Buchanan to the most annoying persecution on account of his supposed heretical opinions; and it was during his enforced stay in a monastery here that he began his celebrated Latin paraphrase of the Psalms. On his release he shortly afterwards proceeded to England, and thence again returned to France towards the end of 1552. In 1555 he was appointed tutor to the son of the famous Maréchal de Brissac, an engagement which he held for five years. Shortly afterwards Buchanan returned to Scotland, and never again left it for a lengthened period. The notices we have of him during this last period of his life show that he played an important part in public affairs. Immediately on his arrival in Scotland, he became classical tutor to Queen Mary, and to her he dedicated his completed version of the Psalms. In 1566 Murray appointed him principal of St Leonard's College, St Andrews; and during three successive years he was chosen one of the four electors of the rector. On his return to Scotland Buchanan had joined the Reformed Church, and in the struggles between Mary and her lords, especially after the murder of Darnley, he vehemently took the side of the latter. Ten days after Mary's imprisonment in Lochleven, Buchanan was chosen moderator of the General Assembly that met in Edinburgh, June 25, 1567; and the next year he accompanied Murray to the celebrated Conference of York, where the question of Mary's

part in Darnley's murder was brought before the commissioners of Elizabeth. Previous to this meeting he had written the *Detectio Marie Regine*, in which he stated with undue violence the case of the insurgent lords against Mary. During the regency of Lennox, Buchanan was appointed tutor to the young king, James VI. In after-years James spoke with pride of his great teacher, though his feeling towards him had more in it of respect than affection. In 1570 Buchanan was made keeper of the Privy Seal, an office that entitled him to a seat in parliament. He resigned this post in 1578, and devoted his remaining years to the completion of his *History of Scotland*, which was published just thirty days before his death. He died on the 28th of September 1582, and was buried in Greyfriars' Churchyard, Edinburgh, at the expense of the city.

In his own day, Buchanan had a European reputation, which rested mainly on his skill in Latin poetry. This was an exercise in which all his learned contemporaries vied with each other; and by their unanimous admission, Buchanan was on this ground without a rival. The publication of his *History of Scotland* was looked forward to as an event in the history of letters. The only part of this history which still retains a certain importance is that which deals with the events of his own time. Of these, indeed, his account is that of a strong partisan; but it is also the account of a practical statesman and a far-seeing observer. Buchanan's influence subsequent to his death was chiefly through his tract *De Jure Regni*. In this tract, written in the form of a dialogue between himself and a brother of Maitland of Lethington, he states with the utmost boldness the doctrine that kings exist by the will, and for the good, of the people. Buchanan's teaching on this point had a most powerful influence on many statesmen who took a leading part in the great political movements of the 17th century. For continental scholars and men of letters of his own age, Buchanan was the most distinguished person then living in Britain. He may, indeed, be fairly regarded as the most brilliant British humanist of the 16th century. As in the case of Erasmus, the reformer and the humanist were in Buchanan pretty well mixed. Up till his final return to Scotland, the humanist distinctly predominated. All through his life, indeed, he wrote against the monks; but it was not so much their false doctrine that offended him, as their ignorance and brutality. Moreover, much of his verse written during this period reveals a view of life far more suggestive of the irony of the humanist than the zeal of a religious reformer. It has been matter of dispute whether the subjects of his erotic verses were real persons or not; but some lines in one of his later poems seem clearly to prove that they were imaginary. On his return to Scotland, politics and religion gradually occupied more and more of his thoughts; yet it is a mistake to suppose that he ever became a politician or a reformer of the type of Knox or Andrew Melville. Our information regarding Buchanan is insufficient to enable us to form a distinct idea of the minuter shades of his character; but we can have no doubt that his personality was of the most commanding order. He had the reverence and affection of men themselves eminent for genius and virtue; while, by those opposed to him in politics and religion, he was spoken of as a monster of vice and ingratitude. See lives by Irving (1817) and the present writer (1890).

Buchanan, JAMES, fifteenth president of the United States, was born near Mercersburg, Pennsylvania, April 23, 1791, the son of an immigrant Irish farmer. He was educated at Dickinson Col-

lege, and in 1812 was admitted to the bar, where he enjoyed a large practice. He served in the state legislature (1815-16), and in congress (1820-31). In 1832 he was sent as envoy-extraordinary to negotiate the first commercial treaty with Russia; and in 1833 he was elected a member of the United States senate, in which he sat till 1845. Appointed by President Polk, in March 1845, secretary of state, he held that office till the close of Polk's presidency, and by his firmness succeeded in settling the Oregon boundary question on lines satisfactory to the United States. Buchanan was ambassador to England from 1853 to 1856, and in the latter year, on the nomination of the Democratic party, he was elected president. During his administration the slavery question drew to a head. Buchanan himself was strongly in favour of the maintenance of slavery; his cabinet was largely made up of advocates of the system; and he freely supported the attempt to establish Kansas as a slave state. As the close of his term approached, it became evident that a conflict was impending, and the election of Lincoln precipitated the outbreak; on the 20th of December, South Carolina formally seceded. The president declined to reinforce Fort Sumter; but neither would he withdraw its garrison, and his cabinet, partaking in the sectional differences, hurriedly broke up. The closing days of his administration were marked by a supineness which facilitated the movements of the party of secession, by whom most of the forts and arsenals in the disaffected states were seized during the winter. After his retirement from office, Buchanan took no part in public affairs; but he published in 1866 a defence of his administration. He died June 1, 1868. See his Life by George Ticknor Curtis (2 vols. New York, 1883).

Buchanan, ROBERT, a versatile writer in verse and prose, born in Glasgow on the 18th August 1841. He was educated at Glasgow University, where his closest friend was the short-lived David Gray (1838-61). In the year 1860 the two set out for London to set the Thames on fire; but gloom and poverty hung over their steps, and fame did not come until too late for the elder of the pair. Buchanan's first work, *Undertones*, a volume of verse, published in 1863, was well received. The *Idylls and Legends of Inverburn* followed in 1865, and next year *London Poems*, the latter his first distinct success, and indeed a rare combination of lyrical vigour and insight into humble life, lightened up with humour and sweetened with pathos. Later volumes of verse are a translation of Danish ballads and *Wayside Posies* (1866); *North Coast Poems* (1867); *Napoleon Fallen: a Lyrical Drama* (1871); *The Drama of Kings* (1871); *Ballads of Love, Life, and Humour* (1882); and *The City of Dream* (1888). He has besides contributed prose to the magazines, and one of his articles earned for itself an unhappy notoriety, that under the pseudonym of 'Thomas Maitland,' on 'The Fleshly School of Poetry' in the *Contemporary Review* for October 1871. It was mainly an attack upon Dante G. Rossetti, and that poet answered for himself in a famous letter to the *Athenian* on 'The Stealthy School of Criticism.' Mr Swinburne's scathing pamphlet, *Under the Microscope* (1872), followed, and eventually Buchanan was fain to withdraw the main part of his charge. Buchanan has also written several novels; among them *A Child of Nature* (1879), *God and the Man* (1881), *The Martyrdom of Madeline* (1882), and *Foraylce Manor* (1884). He was successful as a dramatist with *A Nine Days' Queen*, *Lady Clare*, *Storm-beaten*, and *Sophia* (an adaptation of *Tom Jones*). His poem, *The Wandering Jew* (1893), attacked Christianity. The poet's finances were latterly much embarrassed.

Buchanites, an extraordinary sect of fanatics which sprang up in the west of Scotland in the last quarter of the 18th century. Its founder was Elspeth Buchan, born in 1738, the daughter of John Simpson, a wayside innkeeper near Banff. She married Robert Buchan, a potter, but ultimately separated from him, having begun meanwhile to preach strange religious doctrines which she professed to find in the Scriptures. At Irvine she became acquainted with the Rev. Hugh White, minister of the Relief Church there, a weak and vain man, who adopted her opinions, for which he was deposed by his presbytery. A few followers joined them, but the magistrates expelled her from the town in May 1784. Accompanied by White and a handful of crazy fanatics, she travelled towards Nithsdale, and found a resting-place in a barn at New Cample, near Thornhill. Their whole number was forty-six, and here they built for themselves a house of one apartment with a loft, in which they all dwelt, supported chiefly by the money of the more wealthy of their number. Mrs Buchan, who gave herself out as the woman of Rev. xii., seems to have been rogue as well as fool, for with all her other-worldliness she had a very mundane interest in money, and could hardly have herself believed in the bogus miracles she wrought. The poet Burns in a letter (August 1784) speaks of the idleness and immorality of her followers. They seem to have had a community of women. Mrs Buchan died in May 1791, and was buried clandestinely by White. The last survivor of her sect died in 1848. See *The Buchanites from First to Last*, by Joseph Train (Edin. 1846).

Bucharest (*Bucuresci*), the capital of the former principality of Wallachia and of the present kingdom of Roumania, stands 265 feet above sea-level, in the fertile but treeless plain of the small, sluggish Dambovitza. By rail it is 716 miles SE. of Vienna, 40 N. of Giurgevo on the Danube, and 179 NW. of Varna on the Black Sea. A strange meeting-point of East and West, the town as a whole is but meanly built, but the streets are now mostly paved, and lighted with gas. An elaborate system of fortification was undertaken in 1885. There are some handsome hotels; and the metal-plated cupolas of the innumerable churches give to the place a picturesque aspect. The royal palace was rebuilt in 1885; and the Catholic cathedral is a fine edifice of 1875-84. The number of cafés and gambling-tables is excessive; and altogether Bucharest has the unenviable reputation of being the most dissolute capital in Europe, with all the vices but few of the refinements of Paris. There is, however, a university, founded in 1864. The *corso*, or public promenade, is a miniature Hyde Park. Bucharest is the entrepôt for the trade between Austria and the Balkan Peninsula, the chief articles of commerce being textile fabrics, grain, hides, metal, coal, timber, and cattle. Its manufactures are unimportant, and the workmen are chiefly Hungarians and Germans. Bucharest has been several times besieged; and between 1793 and 1812 suffered twice from earthquakes, twice from inundations, once from fire, and twice from pestilence. At it in 1812 a treaty was concluded between Turkey and Russia, by which the former ceded Bessarabia and part of Moldavia; and in 1886 the treaty between Servia and Bulgaria was made here. Pop. (1866) 141,754; (1892) 196,372. See Mrs Berger's *Winter in the City of Pleasure* (1877).

Buchez, PHILIPPE BENJAMIN JOSEPH, a French physician and publicist, was born 31st March 1796, at Mortagne in Ardennes. After his studies at Paris, he took part in several of the secret plots against the Bourbons, and as a St Simonist edited

for some time the communist journal, *Le Producteur*. After the revolution of 1830, he established and conducted the journal *L'Européen*, as an organ of Neo-Catholicism, and, in concert with M. Roux Lavergne, began the *Histoire Parlementaire de la Révolution Française* (40 vols. 1833-38). His *Introduction à la Science de l'Histoire* had already appeared in 1833, and was followed by his *Essai d'un traité complet de Philosophie, au point de vue du Catholicisme et du Progrès* (3 vols. 1839-40). After the revolution of February 1848, Buchez was made president of the National Assembly; but his want of energy during the disturbance of May 15 cost him all political influence. On the establishment of the Empire, he returned to his studies. He died 12th August 1865.

Büchner, LUDWIG, physician and materialist philosopher, was born at Darmstadt, where his father was a doctor, 29th March 1824. He studied at Giessen, Strassburg, Würzburg, and Vienna. He became a lecturer at Tübingen University, and in 1855 published *Kraft und Stoff* (14th ed. 1876; Eng. trans. *Force and Matter*, 1870), in which he attempted scientifically to establish a materialistic view of the universe. A violent controversy was raised; and Büchner saw himself compelled to resign his university post, and begin medical practice in Darmstadt. He wrote much in periodicals on physiological and pathological subjects, as also in support of his atomistic philosophy; published *Natur und Geist* (1857; 3d ed. 1876), *Aus Natur und Wissenschaft* (1862), as well as works on Darwinism, the idea of God, the intelligence of animals; and translated Lyell's *Antiquity of Man* (1864). He died 2d May 1899.—His brother, GEORGE (1813-37), also a doctor by profession, made a name for himself as a poet; and his sister, LUISE (1823-77), was a poetess and novelist.

Buchu. See BUCKU.

Buck, a name sometimes distinctively appropriated to the adult male of the Fallow Deer (q.v.), the female of which is a *Doc*. But the term is often also applied to the male or other species of deer, as of the Roebuck (q.v.), although never to that of the Red Deer (see DEER), which, when mature, is a Stag or a Hart.

Buckau, a manufacturing town of Prussian Saxony (pop. 16,050), incorporated in 1887 with Magdeburg (q.v.), of which it was a suburb.

Buck-bean, or MARSH TREFOIL (*Menyanthes trifoliata*), a species of Gentianaceae (q.v.), widely

Buck-bean (*Menyanthes trifoliata*):
a, fruit; b, a flower.

distributed in all the colder parts of the northern hemisphere, common in Britain, and not rare in the northern parts of the United States and in Canada. It is easily recognised by its trefoiled leaves, and its small white or pink shaggy flowers.

These are dimorphic, like Primrose (q.v.) or Lythrum. It grows in marshy places, its creeping root-stocks and densely matted roots often rendering boggy ground firm. It is a traditional tonic and febrifuge in rustic and veterinary medicine, especially in Germany, and is also sometimes employed to give bitterness to beer. The root-stock was formerly used as a source of starchy food in Northern Europe.

Buck-eye, an American name for the species of horse-chestnuts (*Aesculus, Pavia*), more especially *A. glabra* and its varieties. *Pavia rubra* is known as red buck-eye, *A. flora* as sweet buck-eye, &c. See HORSE-CHESTNUT.

Buckhound, a name applied to the royal pack of staghounds, which are large-sized foxhounds. The mastership of the Buckhounds, which it was proposed in 1892 to abolish, is always held by a prominent nobleman, who goes in and out with the government. From 1366 till 1633 the mastership was hereditary in the Brocas family. See the monograph on the Brocas by Burrows (1886), and J. P. Hore's *History of the Royal Buckhounds* (1894).

Buckhurst, LORD. See SACKVILLE.

Buckie, a fishing-town of Banffshire, Scotland, 13 miles E.N.E. of Elgin by rail. 'The largest purely fishing-village' in Scotland, Buckie is the head of the fishery district from Banff to Findhorn. The present harbour (1874-80), constructed of concrete at a cost of £60,000, consists of an outer and inner basin, with an area of 9 acres. Pop. (1841) 2165; (1891) 5849.

Buckingham, the county town of Buckinghamshire, stands, almost encircled by the Ouse, 61 miles N.W. of London. An ancient place fortified by Edward the Elder (918), it yet has no antiquities, owing to a great fire in 1725. Since 1848 Aylesbury has superseded it as the assize town, and it lost its last member in 1885. The church (1781) was restored by Sir Gilbert Scott, who was born close by; and there are a town-hall of much the same date, and a grammar-school founded in 1548. The bobbin-lace manufacture has declined. Population, 3364. Stowe House, the princely seat of the Duke of Buckingham, 3 miles to the north-west, was rebuilt towards the close of the 17th century. Its art treasures were sold in 1848. William Giffard became Earl of Buckingham in the reign of William I. The same title was conferred on the youngest son of Edward III. For the first dukes of Buckingham, see below. In 1784 George Grenville, Earl Temple, became marquis of the town of Buckingham, and in 1822 his son became duke. The title of Duke of Buckinghamshire was conferred in 1703 on John Sheffield (q.v.), Marquis of Normanby. His town house was bought by George III. in 1761, and has been repeatedly altered and extended; and in 1837 Buckingham Palace became Queen Victoria's ordinary town residence.

Buckingham, GEORGE VILLIERS, DUKE OF, third son of Sir George Villiers, was born at his father's seat of Brooksbury, Leicestershire, in 1592. In 1614 he was brought before the notice of James I., and was soon received into high favour, as successor to the Earl of Somerset. He was knighted, raised to the peerage as Viscount Villiers in 1616, and became Marquis of Buckingham in 1618. Well-paid offices and rich lands were heaped on him so profusely, that, from a threadbare hanger-on at court, he became, with a single exception, the wealthiest noble in England. In 1620 he married the daughter of the Earl of Rutland, the richest heiress in the kingdom. In 1623, while the Spanish match was in progress, Buckingham persuaded Charles to go himself to Madrid and

prosecute his suit in person. The ultimate failure of the negotiations was greatly owing to Buckingham's arrogance. Both Charles and Buckingham returned from Spain in fierce wrath against that power. In his absence Buckingham was created a duke, and on his return nominated Lord-Warden of the Cinque Ports. He carried on the negotiation for the marriage of Charles with the Princess Henrietta of France; and on Charles's accession in 1625, the duke maintained his ascendancy at court. But after the ill-fated expedition against Cadiz, he became odious to the nation, was impeached by the Commons, and only saved by the king dissolving parliament. His insolent behaviour, shown at this period in making love to the queen of France, next helped to embroil us with that country. In 1627 he appeared with an armament before Rochelle, then in possession of the Huguenots, and in revolt against the French crown. But they refused him admission within the harbour; and when his troops made an ill-conducted descent on the neighbouring Isle of Rhé, they were defeated, and Buckingham returned in disgrace to England. He soon after undertook a second expedition to Rochelle, and had gone down to Portsmouth for embarkation, when on 23d August 1628 he was assassinated by a discontented subaltern, John Felton, who was hanged for the crime at Tyburn.

Buckingham, GEORGE VILLIERS, second DUKE OF, was born at Wallingford House (on the site of the Admiralty), 30th January 1627, and, after his father's assassination, was brought up with Charles I.'s children. On the outbreak of the Civil War, he hurried from Cambridge to the royalist camp, and lost, recovered, and once more lost his estates—almost his life, too, during Lord Holland's unfortunate rising in Surrey (1648), when his younger brother did meet a hero's death. He attended Charles II. to Scotland, and after the battle of Worcester and an escape more marvellous even than his master's, went again into exile. Returning secretly to England, he married, in 1657, the daughter of Lord Fairfax, to whom his forfeited estates had been assigned. The Restoration gave them back to Buckingham, and brought Buckingham to court, where for twenty-five years he was the wildest and wickedest rōné of them all. In 1671 he killed in a duel the Earl of Shrewsbury, whose countess, his paramour, looked on, disguised as a page. When sated with pleasure, he would turn for a change to ambition, and four times his mad freaks lodged him in the Tower. He was mainly instrumental in Clarendon's downfall; was a member of the infamous 'Cabal' (q.v.); and on its break up in 1673 passed over, like Shaftesbury, to the popular side. But crippled with debt, he retired, after Charles's death in 1685, to his manor of Helmsley, in Yorkshire, and amused himself with the chase. He died on 16th April 1688 at Kirby-Moorside, miserably, if not, indeed, 'in the worst inn's worst room.' Buckingham is remembered as the author of several comedies, the wittiest of which, *The Rehearsal* (1671), was a travesty of Dryden's tragedies; but he is better remembered as the 'Zimri' of Dryden's *Absalom and Achitophel*, a portraiture of merciless fidelity.

Buckingham, JAMES SILK, traveller and lecturer, a farmer's son, was born at Flushing, near Falmouth, in 1786, and went to sea before he was ten. After years of unsettled and wandering life, he in 1818 established a journal at Calcutta, the boldness of whose strictures on the Indian government led to his expulsion from Bengal. In London he established the *Oriental Herald* (1824), and the *Athenæum* (1828), now the leading weekly literary journal. Subsequently he travelled through the United States, and from 1832 to 1837

was member for Sheffield. He was projector of a literary club, the British and Foreign Institute (1843-46); and president of the London Temperance League (1851). Besides eighteen books of travel, &c., he had published two volumes of his Autobiography, when he died June 30, 1855. His youngest son, Leicester (1827-65), was a skilful dramatic adapter.

Buckinghamshire, or **BUCKS**, a south-midland county of England, surrounded by Bedfordshire, Herts, Middlesex, Surrey, Berks, Oxfordshire, and Northamptonshire. Thirty-third in size of the English counties, it has a maximum length of 57 miles, a varying breadth of $8\frac{1}{2}$ and 27 miles, and an area of 730 sq. m., or 466,932 acres. It is finely diversified with hill and dale, wood and water. To the south is a broad chalk-band, including the Chiltern range of chalk-hills, which, entering from Oxfordshire and stretching across the county in a north-easterly direction, are partly covered with heath and wood, and rise near Wendover to a height of 905 feet above sea-level. Sloping north from these hills, and crossed by narrower bands of greensand and oolite, is the extensive and very fertile vale of Aylesbury, watered by the Thame. The chief rivers are the Thames, bordering the county on the south-west, the Ouse, Ousel, Colne, and Thame, the last two falling into the Thames. The Grand Junction Canal, and the Great Western and North-Western Railways, with numerous branch lines, traverse the county. The climate is mild and healthy; the soil is mostly good, chalk and clay predominating. Buckinghamshire is eminently an agricultural county, 87 per cent. of the entire area being in cultivation. The farms are generally small, averaging 70 acres. Wheat is the principal crop. The chief dairy product is butter, which finds a ready sale, chiefly in London. In the vale of Aylesbury, fattening of cattle is extensively carried on; the sheep are noted for their fine and heavy fleeces; and large numbers of ducks are reared for metropolitan consumption. Nearly 40 sq. m. are under woods and plantations, beech and oak being the chief timber-trees. The chief manufactures are paper, straw-plait, and thread-lace. The county returns three members to parliament; Aylesbury, Buckingham, Marlow, and Wycombe having ceased in 1885 to be parliamentary boroughs. Buckinghamshire contains some Roman and British remains, as traces of Watling, Icknield, and Ake-man Streets or Ways; remains of the religious houses of Missenden, Notley, Burnham, Medmenham, and Ivinghoe; and vestiges of Lavendon and Whitchurch Castles. There are many examples of Early English and Decorated architecture; and the church of Chetwode (13th century), near Buckingham, contains some fine examples of ancient glass-staining. Many events of historical interest occurred in this county. It was the scene of contest in the civil wars of Stephen and John. At Chalfont St Giles, Milton finished his *Paradise Lost*, and at Horton he wrote *L'Allegro*. At Hampden lived the great patriot of that name; Atterbury was born at Milton; Stoke Poges Churchyard suggested Gray's *Elegy*, and is the place of his burial; at Olney, Cowper lived. Beaconsfield Manor was the seat of Waller; Gregories, near Beaconsfield, of Edmund Burke; Bradenham, of the elder D'Israeli; and Hughenden, of the Earl of Beaconsfield. Scott, the biblical commentator, was rector of Aston Sandford; Herschel's great telescope was erected at Slough, where he made most of his important discoveries; and at Stowe is a magnificent mansion—one of the finest in England, alike for extent, architecture, and beauty of site. Pop. (1801) 108,132; (1881) 176,323; (1891) 185,290. See the

histories of the county by Lipscomb (1847) and Sheahan (1862).

Buckinghamshire, DUKE OF. See SHEFFIELD (JOHN).

Buckland, WILLIAM, D.D., geologist, was born at Tiverton, Devonshire, in 1784. From Winchester he passed in 1801 to Corpus Christi College, Oxford, of which he became a Fellow (1808); and in 1813 he was appointed Oxford reader in Mineralogy. The same year he was elected a Fellow of the Geological Society, and he was twice its president. In 1818 he became reader in Geology at Oxford, and was elected Fellow of the Royal Society. In 1822 he received the Copley medal for his account of the Kirkdale Cave (q.v.), which in 1823 he supplemented with *Reliquiæ Diluvianæ, or Observations on Organic Remains, attesting the Action of a Universal Deluge*, a theory he afterwards saw cause to modify. In 1825 he was appointed a canon of Christ Church, Oxford; in 1832 he was president of the British Association at Oxford; and in 1836 he published his *Bridgewater Treatise, Geology and Mineralogy considered with Reference to Natural Theology*. In 1845 he was made Dean of Westminster; but under his great and continuous labours to benefit others, his mental faculties gave way seven years before his death, which took place August 14, 1856.—His son, FRANCIS TREVELYAN BUCKLAND, was born 17th December 1826, at Christ Church College, Oxford. He was educated at Winchester and Christ Church, and after for five years devoting himself to the study of medicine at St George's Hospital, London, was assistant-surgeon to the 2d Life Guards (1854-63). From his boyhood he manifested an enthusiastic delight in natural history, especially when it could be applied practically to the cultivation of useful quadrupeds, birds, or fish, in which study he was encouraged and guided by his father. He contributed largely to the *Times*, *Field*, *Queen*, and *Land and Water*, which last he started in 1866. He was also author of *Curiosities of Natural History* (4 vols. 1857-72), *Fish-hatching* (1863), *Logbook of a Fisherman and Zoologist* (1876), *Natural History of British Fishes* (1881), and *Notes and Jottings from Animal Life* (1882). He was an acute observer, and his writings on natural history exhibit the results of fresh and original observations in a most interesting manner. He took a great interest in fish-culture, and at his own cost established under the Science and Art Department, South Kensington, a 'Museum of Economic Fish-culture.' In 1867 he was appointed inspector of salmon-fisheries for England and Wales; in 1870 special commissioner on the salmon-fisheries of Scotland; and in 1877 on the Scotch herring-fisheries. He died December 19, 1880. He was not a Darwinian. See his *Life* by G. C. Bompas (1885).

Bucklandia, a magnificent and beautiful evergreen tree of the order Hamamelidæ (see WITCH-HAZEL), a native of the Himalayas, and growing in the island of Sumatra. The timber is not valuable.

Buckle, HENRY THOMAS, was born at Lee, in Kent, 24th November 1821, the son of a London merchant, a Tory and staunch churchman. A sickly child, he was for a very short time at an academy in Kentish-Town; no other school and no university claims credit for his education, which yet was liberal in the highest degree. At the age of eighteen he found himself master of £1500 a year, and by 1850 he knew eighteen foreign languages, and had amassed a library of 22,000 volumes, chosen mostly to help him in a *magnum opus*, which gradually took shape as *The History*

of *Civilisation in England*. The first volume appeared in 1857, the second in 1861; but his health had been meantime shattered by the loss of an idolised mother; and on 29th May 1862, after six months' wandering in Egypt and Palestine, he died of typhoid fever at Damascus. For more than twenty years he had been reckoned one of the first chess-players in the world.

Buckle's plan involved, before tracing the particular history of English civilisation, a general consideration of the progress of those countries, England, France, Germany, Scotland, Spain, and America, in which the elements of modern civilisation are originally found. The two volumes published are occupied with this preliminary examination, which they do not even complete. His objects, however, are clear. They are (1) to discover what is the essential spirit of a nation's history apart from particular men and events, and (2) to trace out the causes of the progress which has been made in England and France. Under the first head he endeavours to show that the spirit or character of a people is determined by material environments, such as soil, climate, food, aspects of nature, and the like; under the second head occurs the theory—whose vigorous application startled and offended many readers—that the progress of society depends upon scepticism; that the retarding force is credulity; and that the excessive 'protection' exercised by governments, the nobility, the church, &c. over the 'people,' has dwarfed and held back the spirit of freedom and civilisation. These and other positions are defended by Buckle with great ingenuity and lucidity of argument and expression, and have been admitted, even by his opponents, to contain much truth. He is accused—not unjustly—of being often one-sided, and of drawing sweeping deductions from an imperfect survey of facts.

See *Miscellaneous and Posthumous Works*, ed. by Miss Taylor (1872; new ed. by Grant Allen, 1880); the *Life* by A. H. Huth (2 vols. 1880); and J. M. Robertson, *Buckle and his Critics* (1895).

Buckles, metal instruments, consisting of a rim and tongue, used for fastening straps or bands in dress, harness, &c. These are made on a very large scale in the neighbourhood of Birmingham. Both brass and iron are used for them, the chief kinds being called tongue, roller, brace, and gear buckles. The use of buckles, instead of shoe-strings, was introduced into England during the reign of Charles II. They soon became very fashionable, attained an enormous size (the largest being called Artois buckles, after the Comte d'Artois, brother of the king of France), and were usually made of silver, set with diamonds and other precious stones. In the latter half of the 18th century the manufacture of buckles was carried on most extensively in Birmingham, there being at one time not less than 4000 people directly employed in that town and its vicinity, who turned out 2,500,000 pairs of buckles annually, the prices ranging from one shilling to five guineas, and even ten guineas a pair. When the trade was at its height, however, fashion changed, and in 1791 we find buckle-makers petitioning the Prince of Wales for sympathy, on the ground that owing to the introduction of shoe-strings and slippers, 20,000 persons were in terrible distress. The prince promised to assist them as far as he could by wearing buckles himself, and enjoining his household to do the same; but fashion was too strong even for him, and before the close of the century a great staple trade of Birmingham had become extinct, though shoe-buckles are still by no means unknown.

Buckram. This name is now applied to a coarse open-woven fabric of cotton or linen made

very stiff with size. It is used for the framework of ladies' bonnets, for the inside of belts and collars of dresses, and for bookbinding. But the buckram of olden times was an entirely different kind of stuff. The Rev. Dr Rock, in his *Catalogue of Textile Fabrics in the South Kensington Museum*, after stating that the term came from the city of Bokhara in Tartary, where a peculiar kind of cotton texture was made, says: 'All along the middle ages buckram was much esteemed for being costly and very fine, and consequently fit for use in church vestments, and for secular personal wear. Grandison, consecrated Bishop of Exeter in 1327, gave to his cathedral banners of white and red buckram; and three of the rich veils for covering the lectern in that church were lined with blue bokeram. As late as the beginning of the 16th century this stuff was held good enough for lining to a black velvet gown for a queen, Elizabeth of York;' but to most minds it is now familiar through Falstaff's antagonists, the 'rogues in buckram suits.'

Buckskin is a soft leather made of deerskin or sheepskin; also a strong, twilled woollen cloth, cropped of nap and carefully finished. 'Buckskin breeches' are usually of this cloth, not of the leather. See **BUFF LEATHER**.

Buckstone, JOHN BALDWIN, comedian and dramatic writer, was born at Hoxton, London, in 1802, and, having in 1822 exchanged an attorney's office for the provincial stage, appeared next year at the Surrey Theatre. His success was so unequivocal that in 1827 he was engaged by the Adelphi Theatre, where he continued till 1833 as leading low comedian. Except for a visit to the United States in 1840, and short engagements at Drury Lane and the Lyceum, he thenceforward played chiefly at the Haymarket, of which he was lessee from 1833 till 1878. He died 31st October 1879. Buckstone's acting was not more noted for its comicality and humour, which never degenerated into vulgarity, than for its distinct appreciation of the peculiar traits in each individual character he assumed. He was also a prolific dramatic author, and of the 150 pieces he wrote for the stage, several have been highly popular.

Buckthorn (*Rhamnus*), a genus of Rhamnaceæ (q.v.), including sixty species, all shrubs or trees, widely distributed through temperate and tropical regions, but absent from Australia.—The Common Buckthorn (*R. catharticus*) is characterised by its spinous and cross-like branchlets, serrate leaves, and yellow-green dioecious flowers. The berries, which are about the size of peas, globular, bluish-black, nauseous, and violently purgative, were formerly much used in medicine, but now more rarely, and only in the form of a sirup prepared from their juice. They supply the Sap Green (q.v.) or Bladder Green of painters. The bark affords a beautiful yellow dye. The buckthorn is sometimes planted for hedges, but is of too straggling a habit.—The Alder Buckthorn, or Breaking Buckthorn (*R. frangula*), also (wrongly) called Black Alder, or Berry-bearing Alder, is spineless, with oval entire leaves, and small, whitish, axillary flowers. The berries are small and black, and also violently purgative, yet are freely eaten by birds. The charcoal of the wood is light, and is used by gunpowder-makers and called dogwood. The bark, leaves, and berries are used for dyeing. The flowers are peculiarly grateful to bees.—Dyer's Buckthorn (*R. infectorius*) is a low shrub, abundant in the south of Europe, whose unripe fruit yields a brilliant yellow dye. The French Berries, Avignon Berries, or Yellow Berries of dyers, are the fruit of this and other species.—Of North American buckthorns there are, besides the Com-

mon one, six or more peculiar species. The most important is the *R. purshiana* of the north-west Pacific slope (especially south-west Oregon), the

Alder Buckthorn (*Rhamnus frangula*):
a, a flower.

cathartic bark of which is used in medicine under the name of *Cascara Sagrada*.—The Sea Buckthorn (q.v.; *Hippophaë rhamnoides*) is a shrub of a different genus and order (*Eleagnæ*). It is occasionally planted as an ornamental shrub.

Bucku, or **BUCHU**, a Hottentot name common to several small aromatic evergreen rutaceous shrubs of the genus *Barosma* (*Diosma*), natives of the Cape of Good Hope, the leaves of which (*folia Buchu*) have enjoyed considerable medical repute, especially as a diuretic.

Buckwheat (*Fagopyrum esculentum*, or *Polygonum Fagopyrum*) is a native of the basin of the Volga, the shores of the Caspian Sea, and many parts of Central Asia. A recent German authority affirms that there is no authentic mention of it

Buckwheat (*Fagopyrum esculentum*):
a, a flower; b, a seed; c, root.

until 1436 at Mecklenburg, whence it spread over Europe in the following century. It is also said to have been introduced by the Moors into Spain, and

thence to have extended over Europe, or, again, to have been brought to Europe by the Crusaders. The French name *Sarrasin* seems to support these latter traditions. It is cultivated on account of the farinaceous albumen of its seeds, which are used, as grain, for food of man and cattle. It is upright, branched, 1 to 3 feet in height; the leaves are between heart-shaped and arrow-shaped, the flowers pale red, the seed (nut) black and triangular, its angles entire. The resemblance of this seed in form to the beech-nut is supposed to be the reason of the German name *Buchweizen* (lit. 'beech-wheat'), from which the English name is derived. Buckwheat is a very common crop in some parts of Europe and of the United States of North America, but is seldom sown in Britain, except as food for pheasants, as it requires continued dry weather in autumn for profitable harvesting. In north-east Germany, and also in Brittany, buckwheat is valued as a crop, particularly for sandy heaths, moorlands, and other poor soils. It yields abundantly, and requires little manure or attention. Forty bushels or more per acre may be expected, weighing 46 or 48 lb. per bushel; and notwithstanding the resemblance of the seed to grain in its qualities and uses, wheat or any other cereal crop generally succeeds well after buckwheat. The seed is most frequently used in the shape of groats, or made into pottage; in the United States, thin cakes of the flour are a standard food. It is very nutritious, containing about 10 per cent. of gluten and 52 per cent. of starch, besides about 6 per cent. of gum and sugar. It is said to be as good as barley for fattening cattle, and better for horses than oats. But as the seed is covered with a very hard rind or thin shell, it must always be shelled before being given to cattle. Poultry are very fond of it. Beer is sometimes brewed from it, and it yields a spirituous liquor of good quality; indeed, it is frequently used in gin-distilleries. As green fodder, the herbage of the plant is said to be more nutritious than clover; but it is said to act as a narcotic on sheep. Bees delight in its flowers, and in some parts of the United States it is sown on this account. In America the seed is usually sown broadcast over the land, which has been ploughed in autumn or early spring, and well scarified or harrowed. About a bushel and a half of seed per acre is required when sown broadcast, but a bushel is sufficient if drilled with a machine. In the latter case it should not be sown in narrower drills than one foot apart, but two feet is recommended as being better for the succeeding crop, as the wider intervals can be properly cultivated. It should not be sown in England before the middle of May, as the least frost is injurious. When the lower seeds are ripe it should be mown, as they are easily shed out if allowed to stand too long.—Tartarian Buckwheat (*F. tataricum*) is distinguished by the toothed edges of the seeds and its more vigorous growth. It is hardy, and adapted for cold situations, but yields inferior meal, and is reckoned a mere weed in Germany. In Canada, on the other hand, it is much grown; but its use, as well as that of common buckwheat, is thought by many to induce skin disease. *F. emarginatum* is cultivated in China.—Dyer's Buckwheat is *Polygonum tinctorium*. See POLYGONÆ.

Bucolic, a term derived from the Greek, 'belonging to herdsmen,' nearly equal to *Pastoral*, from Latin. It is specially used of a kind of Pastoral Poetry (q.v.). The great bucolic poets were Theocritus, Bion, Moschus; and Virgil's Eclogues are sometimes called *Bucolica*.

Buczacz, a town of Austria, in Galicia, on the Stripa, an affluent of the Dniester, 47 miles ENE. of Stanisław by rail. A treaty of peace between the

Poles and the Turks was signed here in 1672. Pop. 9970, of whom 6281 were Jews.

Bud. The bud is the rudiment of an axis with its appendages. Starting with the seed, we may trace the continued upgrowth of the primeval bud or plumule in germination. Again, by examination

Fig. 1.—Longitudinal section through the apical region of an upright shoot of *Hippuris vulgaris*:

s, growing point of the stem; *b, b, b*, the whorled leaves; *k, k, k*, the buds in their axils, which all develop into flowers; *g, g*, the first vessels (the dark parts of the tissue indicate the inner cortex with its intercellular spaces). (After Sachs.)

of the growing point at any age, we may observe the progressive development of new appendages with crowded nodes but lengthening internodes of stem from the undifferentiated embryonic tissue (see MERISTEM) of its apex (fig. 1). In monocotyledons especially, an axis may have only a single apical bud; and of this mode of growth the palm furnish the most salient example; in the majority of dicotyledons, on the other hand, every vegetative leaf may be regarded as having, if not an actual, at any rate a potential or latent bud

in its axil, which may, at least under exceptional circumstances, vegetate as a new axis or branch (q.v.), or become developed for reproduction as a flower.

In some hardy shrubs and trees the buds are quite inconspicuous in winter, being so minute as to be hidden under an apical coating of bark (e.g. *Taxodium*, *Philadelphus*); generally, however, the buds are well formed before autumn, and are thus fully exposed to the severity of winter. In a few cases (e.g. species of *Viburnum*, although not the common Guelder Rose) the outer leaves still retain sufficient vitality to expand as the first foliage of spring. In the vast majority of plants, however, the leaves are not so hardy, and the outer ones have thus to be sacrificed for the protection of the rest. Since in any upward-growing axis, the lower and earlier formed appendages tend to grow beyond the embryonic apex with its short internodes, and thus cover it up more or less entirely with its developing higher and younger appendages, the normal form of every bud is thus, as it were, a kind of incipient cabbage; and this overlapping

mode of growth comes to be of the greatest protective usefulness. For the changes of day and night, of weather, and most of all, of the seasons, render the process of growth not continuous but rhythmic; and a growing point has thus latent as well as active periods. During the former, however, the outer appendages are exposed to the climate, and usually present adaptive modifications of great variety and interest, which are known as the *bud-scales*. These are often waterproofed with an exudation of resinous varnish, or warmly lined with an epidermic down.

While, in what may be safely taken as the simplest cases, the bud-scales are modifications of entire leaves (e.g. lilac or rhododendron, fig. 2), in many plants the bud-scale is reduced to the petiole only. This is beautifully shown where a series of gradations survives, as is

very often the case in the horse-chestnut; in opening buds of which it is often possible to trace every step of the reduction of the complete foliage-leaf to the petiolar bud-scale (fig. 3, *b*). Finally, bud-scales may be derived from stipules, as in the magnolia or

Fig. 3.

a, opening ends of beech, showing stipular bud-scales; *b*, petiolar bud-scales of horse-chestnut, showing transitions to the two true leaves above.

the beech (fig. 3, *a*). In all these cases alike, the scales are thrown off by the opening buds in spring, and often carpet the ground like a foreshadowing of autumn.

Buds, as has been said, when other than terminal, are usually axillary to the leaves, and their origin may be traced almost as far back as that of the leaves themselves; this may be conveniently seen in a section of the growing point of the mare's-tail (*Hippuris*, fig. 1). Occasionally, too, the bud forms quite under the base of the leaf-stalk, and is concealed by it until this falls off in autumn (*Platanus*). There is usually only one bud in each axil, yet in many plants 'accessory buds' occur. These may be collateral in position, the middle one being largest, as in some hawthorns, willows, and maples; in other cases, however, they form a vertical series, of which either the lowest, and alone strictly axillary bud, may be largest and strongest, as in some honeysuckles, or the uppermost, as in the *Aristolochia* or the butternut, where, indeed, the main branches are thus extra-axillary.

In many cases buds are also of *adventitious* origin—i.e. may arise quite independently of leaves, from any part of the stem—as is well seen on the trunk of the elm-tree, in pollarded willows, in fact in any tree deprived of its branches, or often even after being felled. This is intelligible when we reflect that at all such points there lies the *Cambium* (q.v.) or embryonic layer of cells; in the rarer case of origin of adventitious buds from roots, as in the bramble, we have similarly a *pericambium* (see ROOT): the most curious and exceptional (yet in a deeper view of cellular physiology the most natural) mode of origin is when the leaf-parenchyma itself retains a sufficiently embryonic character to give rise to new buds without the presence of any specially reproductive cells. This is well seen on the surface of the fronds of certain ferns, and is also experimentally reproduced by gardeners, who often raise young plants from the edges of a *Bryophyllum* leaf (fig. 4), or from the petiole or wounded surface of a leaf of *Begonia*, by simply placing it on sand in a warm and moist atmosphere.

Fig. 4.—*Bryophyllum* Leaf, from the edges of which two new plants have budded.

This passage from ordinary vegetative growth to

Rhododendron.

is reduced to the petiole only. This is beautifully shown where a series of gradations survives, as is

that discontinuous growth which we call asexual reproduction, and also that further transition to sexual reproduction (see REPRODUCTION, SEX), is admirably illustrated by the interesting reversions to ordinary bud-growth which these more specialised processes often exhibit in unusually favourable vegetative conditions, or even as a permanent habit. Thus in Ferns (q.v.) we may have the budding of prothallia directly upon the frond in the place of spore-cases, or that of the fern plant directly upon the prothallium in place of archegonia. Again, the reversion of floral to leafy buds occurs more or less completely in many garden-flowers, while in many wild species of Allium the flowers become largely replaced by vegetative buds capable of independent growth. This tendency to bud-independence is also well shown in the bulbils and bulbs of many other allied Liliaceæ; while the multiplication of plants by cuttings of course takes advantage of the same widespread latent possibility of separate bud-life. In the old disputes about the individuality of plants and animals, the bud was in fact often defined as a separate individual, and the tree thus viewed as a mere colony of buds. For the growth of buds, see BRANCH; and for arrangement of leaves in buds, see VERNATION, ÆSTIVATION, FLOWER.

Budding or gemmation is also a frequent mode of growth in animals. See REPRODUCTION.

Budæus (the Latinised form of *Guillaume Budé*), the greatest French scholar of his age, was born in Paris in 1467. His works on philology, philosophy, and jurisprudence display extensive learning, the two best known being the *De Asse et Partibus ejus* (1514), which contains a very thorough investigation into ancient coins, and the *Commentarii Lingue Græcæ* (1519), the basis of all subsequent works in this department. His abilities were manifested not only in literature, but in public business. Louis XII. twice sent him to Rome, and Francis I. also employed him in several negotiations. At Budæus's suggestion, Francis founded the Collège de France, and was also persuaded to refrain from prohibiting printing, which the bigoted Sorbonne had advised in 1533. He was royal librarian at the time of his death, 23d August 1540. He was suspected, not without reason, of a leaning towards Lutheranism. His works were collected in 4 vols. (Basel, 1557). See his Life by Rebitté (1846), and E. de Budé (1884); and the latter's edition of his *Lettres inédites* (2 vols. 1887).

Bu'dapest. the official designation of the capital of Hungary, which consists of Buda (Ger. *Ofen*) on the right and Pest or Pesh on the left bank of the Danube, the two cities having formed a single municipality since 1872. See PESTH.

Budaun. a town of India, 140 miles NW. of Lucknow, giving name to a British district of the Rohilcund division of the North-west Provinces. Pop. (1891) 35,372.—The district, a level, fertile tract on the Ganges and its tributaries, contains an area of just over 2000 sq. m.; and nearly six-sevenths of its inhabitants are Hindus.

Buddhism. The religion known as Buddhism (from the title of 'The Buddha,' meaning 'the awakened,' 'the enlightened,' acquired by its founder) has existed now for perhaps 2400 years, and is, as regards the number of its adherents, the prevailing religion of the world. In India, the land of its birth, it has now little hold, except among the Nepalese and some other northern tribes; but it bears full sway in Ceylon and over the whole Indo-Chinese Peninsula; it divides the adherence of the Chinese with the systems of Confucius and Lao-tse, claiming perhaps a majority of the population; it prevails also in Japan (although

not the established religion); and, north of the Himalayas, it is the religion of Tibet (where it assumes the form of Lamaism), of the Mongolian population of Central Asia and Southern Siberia, and of the Tatar tribes on the Lower Volga. Its adherents are estimated at more than 500 millions—or about a third of the whole human race. Yet, till towards the middle of the 19th century, nothing was known in Europe respecting the nature and origin of this world-religion, beyond the vaguest notices and conjectures. About the year 1828, Mr B. H. Hodgson, British resident at the court of Nepal, where Buddhism prevails, discovered the existence of a large set of writings in the Sanskrit language, forming the national canonical books. These books were afterwards found to be the texts from which the Buddhist scriptures of Tibet, Mongolia, and China must have been translated. The books of the Ceylon Buddhists are in the language called Pali; and though not translations of the Nepalese standards, they are found to agree with them in substance, and to be only another and somewhat later version of the same traditions. Translations from the Ceylon standards are used by the Buddhists of Burma and Siam. Copies of the Sanskrit books of Nepal, having been sent by Mr Hodgson to the Asiatic Societies of London and Paris, engaged the attention of the great orientalist, Eugène Burnouf, who published in 1844 his *Introduction à l'Histoire du Bouddhisme Indien*; and this book may be said to have been the beginning of anything like correct information on the subject among the western nations.

The most diverse opinions had previously prevailed as to the time and place of the origin of Buddhism. Some looked upon it as a relic of what had been the original religion of India, before Brahmanism intruded and drove it out; a relic of a widespread primeval worship, whose ramifications they endeavoured to trace by identifying Buddha with the Odin of the Scandinavians, the Thoth or Hermes of the ancient Egyptians, and other mythological personages. Others held that it could not be older than Christianity, and must have originated in a blundering attempt to copy that religion—so striking are the many points of resemblance that present themselves. Although the materials are still wanting for a circumstantial history of Buddhism, the main outline is no longer doubtful. Oriental scholars now generally concur in fixing the date of its origin some time in the 5th century B.C., and in making it spring up in the north of India. According to the Buddhist books, the founder of the religion was a prince of the name of Siddhartha, son of Suddhodana, king of Kapilavastu, which is placed somewhere on the confines of Oudh and Nepal. He is often called Sakya, which was the name of the family, or Sakya-muni—i.e. the Sakya sage—and also Gautama, the name of the great 'solar' race of which the family was a branch. To Gautama is frequently prefixed *Sramana*, meaning *ascetic*. Of the names, or rather titles, given to Siddhartha in his state of perfection, the most important is the *Buddha*, which is from the root *budh*, 'to awake,' 'to know,' and which in this connection means 'he who is liberated from existence by the knowledge of the truth'; it is indicative of the leading doctrine of his system. Others are—'The Blessed' (*Bhagavat*); 'the King of Righteousness' (*Dharmaraja*); 'the Conqueror' (*Jina*), &c. The history of Buddha is overlaid with a mass of extravagant and incredible legend; and H. H. Wilson thought it doubtful whether the Buddha was an actual historical personage, and not rather an allegorical figure. Snart and Kern sought to show that the Buddha of the legend is the sun-god, and that the

details of his life have been taken from solar mythology, and that the whole has been modified under the influence of the monastic ideas amid which the legend grew up, though they allowed that Buddhism had a human founder. Few orientalists are prepared to follow them.

The Founder.—Assuming that the Buddha was a real person, and that there is a basis of fact under the mass of extravagant fable with which he is surrounded, the history of Buddhism may be thus briefly outlined: The Prince Siddhartha gives early indications of a contemplative, ascetic disposition; and his father, fearing lest he should desert his high station as Kshatriya (see CASTE and INDIA) and ruler, and take to a religious life, has him early married to a charming princess, and surrounded with all the splendour and dissipation of a luxurious court. Twelve years spent in this environment only deepen the conviction that all that life can offer is vanity and vexation of spirit. He is constantly brooding over the thought that old age, withered and joyless, is fast approaching; that loathsome or racking sickness may at any moment seize him; that death will at all events soon cut off all present sources of enjoyment, and usher in a new cycle of unknown trials and sufferings. These images hang like Damocles' sword over every proposed feast of pleasure, and make enjoyment impossible. He therefore resolves to try whether a life of austerity will not lead to peace; and, although his father seeks to detain him by setting guards on every outlet of the palace, he escapes, and begins the life of a religious mendicant, being now about thirty years old. To mark his breaking off all secular ties, he cuts off the long locks that were a sign of his high caste; and as the shortened hair turned upwards, he is always represented in pictures with curly hair. He commences by studying all that the Brahmins can teach him, but finds their doctrine unsatisfactory. Six years of rigorous asceticism are equally vain; and resolving to return to a more genial life, he is deserted by his five disciples, and then undergoes a fierce temptation from the demon of wickedness. But no discouragement or opposition can divert Sakya-muni from the search after deliverance. He will conquer the secret by sheer force of thinking. He sits for weeks plunged in abstraction, revolving the causes of things. If we were not born, he reflects, we should not be subject to old age, misery, and death; therefore the cause of these evils is birth. But whence comes birth or continued existence? Through a long concatenation of intermediate causes, he arrives at the conclusion that ignorance is the ultimate cause of existence; and therefore, with the removal of ignorance, existence and all its anxieties and miseries would be cut off at their source. Passing through successive stages of contemplation, he realises this in his own person, and attains the perfect wisdom of the Buddha. The scene of this final triumph received the name of Bodhimanda ('the seat of intelligence'), and the tree under which he sat was called Bodhidruma ('the tree of intelligence'), whence Bo-tree. The Buddhists believe the spot to be the centre of the earth. Twelve hundred years after the Buddha's death, Hwen-Thsang, the Chinese Pilgrim, found the Bodhidruma—or a tree that passed for it—still standing. Although the religion of Buddha is extinct in the neighbourhood, there are, 6 miles from Gaya town, in Bengal, extensive ruins and a 14th-century temple (partially restored since 1878), which are believed to mark the place. Within the temple courtyard is a pipal-tree, which claims to be the lineal descendant of the original Bo-tree. See BO-TREE.

Having arrived at the knowledge of the causes of misery, and of the means by which these causes

are to be counteracted, the Buddha was now ready to lead others on the road of salvation. It was at Benares that he first preached, or, in the consecrated phrase, 'turned the wheel of the law.' (This expression comes from one of the titles of the Buddha, *chakravartin*, 'a monarch,' being taken in its etymological sense—i.e. 'the turner of a wheel;') hence, too, have arisen, probably, those praying-wheels seen standing before Buddhist monasteries in Tibet and elsewhere. The doctrines of Buddha are inscribed on the wheel, which is then set in motion by a windlass, or even by horse-power. The individual monks have portable ones, with which they perform their devotions.) But the most important of his early converts was Bimbisara, the sovereign of Magadha (Behar), whose dynasty continued for many centuries to patronise the new faith. During the forty years that the Buddha continued to preach his strange gospel, he appears to have traversed great part of Northern India, combating the Brahmins, and everywhere making numerous converts. He died at Kusinagara (in Oudh), at the age of eighty; and his body being burned, the relics were distributed among a number of contending claimants, and monumental tumuli were erected to preserve them. See TOPES.

History of the Order.—The most important point in the history of Buddhism, after the death of its founder, is that of the three councils which fixed the canon of the sacred scriptures and the discipline of the church. The Buddha had written nothing himself; but his chief followers assembled in council immediately after his death to settle the rules and doctrines of the order. About a hundred years later, a second council was held to vindicate these against innovators who seceded and held a rival council. In the reign of Asoka, in 244 B.C., there was a third, in which the canon seems to have been fixed more accurately. Some 150 years later it was reduced to writing, apparently in its present form. These canonical writings are divided into three classes, forming the Tripitaka, or 'triple basket.' The first class consists of the *Sutras*, or discourses of the Buddha for the laity; the second contains the *Vinaya*, or discipline for the order; and the third the *Abhidharma*, or metaphysics. The first is evidently the fundamental text out of which all the subsequent writings have been elaborated. The Buddhist religion early manifested a zealous missionary spirit; and princes and even princesses became devoted propagandists. A prince of the royal House of Magadha, Mahindo, carried the faith to Ceylon immediately after the last council, whence it spread to Burma, 450 A.D., and Siam, 638 A.D. The Chinese annals speak of a Buddhist missionary as early as 217 B.C.; and the doctrine made such progress that in 65 A.D. it was acknowledged by the Chinese emperor as a third state religion. The Chinese Buddhists have always looked on India as their 'holy land;' and, beginning with the 4th century of our era, a stream of Buddhist pilgrims continued to flow from China to India during six centuries. Several of these pilgrims have left accounts of their travels, which throw a light on the course of Buddhism in India, and on the internal state of the country in general, that is looked for in vain in the literature of India itself (see HWEN-THSANG). As to the spread of Buddhism north of the Himalayan Mountains, we have the historical fact that a Chinese general, having about the year 120 B.C. defeated the barbarous tribes to the north of the Desert of Gobi, brought back as a trophy a golden statue of the Buddha.

A prominent name in the history of Buddhism is that of Asoka (q.v.), king of Magadha, in the 3d century B.C., whose sway seems to have extended over the whole peninsula of Hindustan, and even

over Ceylon. This prince was to Buddhism what Constantine was to Christianity. He was at first a persecutor of the faith, but being converted—by a miracle, according to the legend—he became its zealous propagator. Not, however, as princes usually promote their creed; for it is a distinguishing characteristic of Buddhism that it has never employed force, hardly even to resist aggression. Asoka showed his zeal by building and endowing viharas or monasteries, and raising topes and other monuments over the relics of Buddha and in spots remarkable as the scenes of his labours. Hwen-Thsang, in the 7th century of our era, found topes attributed to Asoka from the foot of the Hindu Kush to the extremity of the peninsula. There exist, also, in different parts of India, edicts inscribed on rocks and pillars, inculcating the doctrines of Buddha. The edicts are in the name of King Piyadasi; but orientalists are almost unanimous in holding Piyadasi and Asoka to be one and the same. Not a single building or sculptured stone has been discovered in continental India of earlier date than the reign of this monarch, whose death is assigned to 223 B.C. A remarkable spirit of charity and toleration runs through these royal sermons. The 'king beloved of the gods' desires to see the ascetics of all creeds living in all places, for they all teach the essential rules of conduct. 'A man ought to honour his own faith only; but he should never abuse the faith of others. . . . There are even circumstances where the religion of others ought to be honoured, and in acting thus, a man fortifies his own faith, and assists the faith of others.' The next name of importance after Asoka is that of Kanishka (10 A.D.), king of North-western India, under whose direction a council was held for a fresh revision of the canon. It seems to have been shortly after this that the Buddhists broke up into two schools—viz. the 'Lesser Vehicle,' or conservative party, formed by the southern Buddhists, and the 'Greater Vehicle,' or progressive party, embracing the Buddhists of the north.

For the glimpses we get of the state of Buddhism in India, we are indebted chiefly to the accounts of Chinese pilgrims. Fa-hian, at the end of the 4th century, found some appearances of decline in the east of Hindustan, its birthplace, but it was still strong in the Punjab and the north. In Ceylon, it was flourishing in full vigour, the ascetics or monks numbering from 50,000 to 60,000. In the 7th century—i.e. 1200 years after the death of the Buddha—Hwen-Thsang represents it as widely dominant and flourishing, and patronised by the powerful Siladitya, king of Kanauj, who held a council at which the doctrines of the Little Vehicle were condemned. Its history was doubtless more or less checkered. The Brahmins, though little less tolerant than the followers of Buddha, seem to have been in some cases roused into active opposition; and some princes employed persecution to put down the new faith.

It was probably during the first four or five centuries of our era, and as a result of persecution, that Buddhists, driven from the great cities, retired among the hills of the west, and there constructed those cave-temples which, for their number, vastness, and elaborate structure, continue to excite the wonder of all who see them. There are reckoned to be not fewer than 900 Buddhist excavations still extant in India, nearly all within the presidency of Bombay. The destruction of Buddhism in India seems to have been brought about largely by internal corruption, but most of all by the Mohammedan invasion. For several centuries we have notices of it as existing in Kashmir, Bengal, and the Deccan, till it at last disappears in Orissa in the middle of the 16th century.

What, then, is the nature of this faith, which has

been for so long, and is still, the sole light of so many millions of human beings? In answering this question, we must confine ourselves here to a brief outline of the intellectual theory on which the system is based, and of the general character of its morality and ritual observances, as they were conceived by the founder and his more immediate followers; referring for the various forms which the external observances have assumed to the several countries where it is believed and practised. See BURMA, CEYLON, CHINA, JAPAN, LAMAISM.

The Doctrine.—Buddhism is based on the same views of human existence, and the same philosophy of things in general, that prevailed among the Brahmins, although it was a reaction against their hierarchy. It accepts without questioning the doctrine of the transmigration of souls, which lies at the root of so much that is strange in the Indian character. For a fuller account of this important doctrine, the reader is referred to TRANSMIGRATION; while the peculiar cosmogony or system of the universe with which it is associated, and which is substantially the same among Hindus and Buddhists, is described under INDIA (Vol. VI. p. 106). It is sufficient here to say that, according to Buddhist belief, when a man dies he is immediately born again, or appears in a new shape; and that shape may, according to his merit or demerit, be any of the innumerable orders of being composing the Buddhist universe—from a clod to a divinity. If his demerit would not be sufficiently punished by a degraded earthly existence—in the form, for instance, of a woman or a slave, of a persecuted or a disgusting animal, of a plant, or even of a piece of inorganic matter—he will be born in some one of the 136 Buddhist hells. These places of punishment have a regular gradation in the intensity of the suffering and in the length of time the sufferers live, the least term of life being ten millions of years, the longer terms being almost beyond the powers of even Indian notation to express. A meritorious life, on the other hand, secures the next birth, either in an exalted and happy position on earth, or as a blessed spirit, or even divinity, in one of the many heavens; in which the least duration of life is about ten billions of years. But however long the life, whether of misery or of bliss, it ends when the *karma* is exhausted, and the individual must be born again, and may again be either happy or miserable—either a god, or, it may be, the vilest inanimate object. One legend makes Bhagavat, in order to impress upon the monks of a monastery the importance of their duties, point to a besom, and, by his supernatural insight, reveal to them that it had once been a novice who had been negligent in sweeping the hall of assembly; the walls and pillars, again, he told them, had once existed as monks, who soiled the walls of the hall by spitting upon them. The Buddha himself, before his last birth as Sakya-muni, had gone through every conceivable form of existence on the earth, in the air, and in the water, in hell and in heaven, and had filled every condition in human life. When he attained the perfect knowledge of the Buddha, he was able to recall all these existences; and that part of the Buddhist legendary literature called the Jatakas narrates his exploits when he lived as an elephant, as a bird, as a stag, and so forth.

The Buddhist conception is peculiar of the way in which the quality of actions—which is expressed by the word *karma* ('doing'), including both merit and demerit—determines the future condition of all sentient beings. They do not conceive any god or gods as being pleased or displeased by the actions, and as assigning the actors their future condition by way of punishment or of reward. The very idea of a god, as creating or in any way

ruling the world, is utterly absent in the Buddhist system. God is not so much as denied: he is simply not known. Contrary to the opinion once confidently and generally held, that a nation of atheists never existed, the Buddhist peoples are essentially atheist; for they know no beings with greater supernatural power than any man is supposed capable of attaining to by virtue, austerity, and science. Indeed some of the Buddhist nations—the Chinese, Mongols, and Tibetans—have no word in their languages to express the notion of God as supreme ruler. The future condition of the Buddhist, then, is not assigned him by the Ruler of the universe; his *karma* determines it by a sort of virtue inherent in the nature of things—by the blind and unconscious concatenation of cause and effect. But the laws by which consequences are regulated seem dark, and even capricious. A bad action may lie dormant, as it were, for many existences; the taint, however, is there, and will some time or other break out. A Buddhist is thus never at a loss to account for any calamity that may befall himself or others.

Another basis of Buddhism is the assumption that human existence is on the whole miserable, and a curse rather than a blessing (see PESSIMISM). This notion, or rather feeling, is, like transmigration, common to Buddhism and Brahmanism, and is even more prominent in Buddhism than in the old faith. It is difficult for a European to conceive this state of mind, or to believe that it can be habitual in a whole people; and many signal errors in dealing with the Indian nations have arisen from overlooking the fact. The cause would seem to lie largely in the comparatively feeble physical organisation of Easterns in general, together with that want of security and peace, and that habitual oppression of the many by the few, with all the attendant degradation and positive suffering, which was long the normal state of things in India. The little value that Hindus set upon their lives is manifested in many ways. The punishment of death has little or no terror for them, and is even sometimes coveted as an honour. For, in addition to the little value of their present existence, they have the most undoubting assurance that their soul, if dislodged from its present tenement, will forthwith find another, with a chance, at least, of its being a better one.

In the eyes, then, of the Sakya-muni and his followers, sentient existence was hopelessly miserable. Misery was not a mere taint in it, the removal of which would make it happy: misery was its very essence. Death was no escape from this inevitable lot; for, according to the doctrine of transmigration, death was only a passage into some other form of existence equally doomed. Even the heaven and the state of godhead which form part of the cycle of changes in this system were not final; and this thought poisoned what happiness they might be capable of yielding. Brahman philosophers had sought escape from this endless cycle of unsatisfying changes by making the individual soul be absorbed in the universal spirit (see BRAHMA). Gautama had the same object in view—viz. exemption from being born again; but he declared the Brahmanic penances inadequate to accomplish this. His philosophy was utterly atheistic, like that of the original Sankhya school of philosophy, with which it is most closely connected, and ignored a supreme God or Creator; it did not leave even an impersonal spirit of the universe into which the human soul could be absorbed. Gautama sees no escape but in what he calls Nirvana, the exact nature of which has been matter of dispute. According to its etymology, the word means 'extinction,' 'blowing out,' as of a candle; and in the

Buddhist scriptures generally it is equivalent to the cessation of individual existence. Even in those schools which have attempted to draw a distinction, the distinction is of the most evanescent nature.

The key of the whole scheme of Buddhist salvation lies in what Gautama called his Four Sublime Verities. The first asserts that pain exists; the second, that the cause of pain is desire or attachment—the meaning of which will appear further on; the third, that pain can be ended by Nirvana; and the fourth shows the way that leads to Nirvana. This way to Nirvana consists in eight things: right views, right feelings, right words, right behaviour, right exertion, right obedience, right memory, and right meditation. The immediate cause of pain is birth, for if we were not born we should not be exposed to death or any of the ills of life. Birth, again, is caused by previous existence: it is only a transition from one state of existence into another. A sentient being consists of an assemblage of material qualities, sensations, ideas, tendencies, and mental powers, none of which are permanent, but dissolve at death. What alone is permanent is the being's *karma*. It does not die. But for it there would be freedom from existence. The cause of existence is a 'grasping state of mind,' or attachments, good and bad. These depend upon desire. We thus arrive at desire—including both the desire to possess and the desire to avoid—as one link in the chain of causes of continued existence and pain. Desire is said to be caused by sensation, sensation by contact, and so on until we come to ideas. Ideas, however, are mere illusions, the results of ignorance or error, attributing durability and reality to that which is transitory and imaginary. Cut off this ignorance, bring the mind into a state in which it can see and feel the illusory nature of things, and forthwith the whole train vanishes: illusory ideas, distinction of forms, senses, contact, sensation, desire, attachment, existence, birth, misery, old age, death!

Morality and Religious Observances.—The eight parts or particulars constituting the theoretical 'way' (to Nirvana), were developed by Gautama into a set of practical precepts enjoining the various duties of common life and of religion. They are all ostensibly intended as means of counteracting or destroying the chain of causes that tie men to existence and necessitate being born again, especially that most important link in the chain constituted by the attachments or desires resulting from former actions: although the special fitness of some of the precepts for that end is far from being apparent. It is easy to understand how the austerities that are prescribed might subdue the passions and affections, and lessen the attachment to existence; but how the exercise of benevolence, of meekness, of regard to truth, of respect to parents, &c. on which Gautama laid so much stress, should have this effect, it is difficult to conceive. Luckily for the Buddhist world, Gautama's moral nature was better than his logic; and as he felt strongly that these things are essentially right and good, he takes it for granted that they must contribute to what was in his eyes the chief good—escape from existence, or Nirvana. In delivering his precepts, the Buddha considers men as divided into two classes—those who have embraced the religious life (*Sramanas*), and those who continue in the world, or are laymen. These last are considered as too much attached to existence to feel any desire or have any hope of emancipation, at least at this stage. But there are certain precepts which it is necessary for all to obey, that they may not bring greater misery upon themselves in their next births, and rivet the bonds of existence more indissolubly.

There are ten moral precepts or 'precepts of aversion.' Five of these are of universal obligation—viz. not to kill; not to steal; not to commit adultery; not to lie; not to be drunken. Other five are for those entering on the direct pursuit of Nirvana by embracing the religious life: to abstain from food out of season—that is, after mid-day; to abstain from dances, theatrical representations, songs, and music; to abstain from personal ornaments and perfumes; to abstain from a lofty and luxurious couch; to abstain from taking gold and silver. For the regular ascetics or monks there are a number of special observances of a very severe kind. They are to dress only in rags, sewed together with their own hands, and to have a yellow cloak thrown over the rags. They are to eat only the simplest food, and to possess nothing except what they get by collecting alms from door to door in their wooden bowl. They are allowed only one meal, and that must be eaten before mid-day. For a part of the year, they are to live in forests, with no other shelter than the shadow of a tree, and there they must sit on their carpet even during sleep, to lie down being forbidden. They are allowed to enter the nearest village or town to beg food, but they must return to their forests before night.

Besides the absolutely necessary 'aversions and observances' above mentioned, the transgression of which must lead to misery in the next existence, there are certain virtues or 'perfections' of a supererogatory or transcendent kind, that tend directly to 'conduct to the other shore' (Nirvana). The most essential of these are almsgiving or charity, purity, patience, courage, contemplation, and knowledge. Charity or benevolence may be said to be the characteristic virtue of Buddhism—a charity boundless in its self-abnegation, and extending to every sentient being. The benevolent actions done by the Buddha himself, in the course of his many millions of migrations, were favourite themes with his followers. On one occasion, seeing a tigress starved and unable to feed her cubs, he hesitated not to make his body an oblation to charity, and allowed them to devour him. Benevolence to animals, with that tendency to exaggerate a right principle so characteristic of the East, is carried among the Buddhist monks to the length of avoiding the destruction of fleas and the most noxious vermin, which they remove from their persons with all tenderness.

There are other virtues of a secondary kind, though still highly commendable. Thus, not content with forbidding lying, the Buddhist strictly enjoins the avoidance of all offensive and gross language, and of saying or repeating anything that can set others at enmity among themselves; it is a duty, on the contrary, especially for a *sramana*, to act on all occasions as a peacemaker. Patience under injury, and resignation in misfortune, are strongly inculcated. Humility, again, holds a no less prominent place among Buddhist graces than it does among the Christian. The Buddhist saints are to conceal their good works, and display their faults. As the outward expression of this sentiment of humility, Gautama instituted the practice of confession. Twice a month, at the new and at the full moon, the monks confessed their faults aloud before the assembly. If these were slight, some slight penance was imposed, such as sweeping the courtyard of the monastery. This humiliation and repentance seems the only means of expiating sin that was known to Gautama. Confession was exacted of all believers, only not so frequently as of the monks. The edicts of Piyadasi recommend a general and public confession at least once in five years.

Such are the leading features of the moral code of the Buddha, of which it has been said that 'for pureness, excellence, and wisdom, it is second only to that of the Divine Lawgiver himself.' But the original morality of Buddhism has, in the course of time, been disfigured by many subtleties, puerilities, and extravagances, derived from the casuistry of the various schools of later times; just as the casuistry of the Jesuits, for instance, perverted many of the precepts of Christianity. The theory on which the Buddha founds his whole system gives, it must be confessed, only too much scope to such perversions; for, on that theory, truth is to be spoken, self to be sacrificed, benevolence to be exercised, not for the sake of the good thus done to others, but solely for the effect of this conduct on the soul of the actor, in preparing him for escape from existence. To teach men 'the means of arriving at the other shore' was another expression for teaching virtue; and that other shore was annihilation. On this principle, the Buddhist casuist can, like the Jewish, render of none effect the universal law of charity and the duty of respecting and aiding parents, on which the Buddha laid such stress. Thus, a Bhikshu—i.e. one who has engaged to lead a life of self-denial, celibacy, and mendicancy, and is thus on the high-road to Nirvana—is forbidden to look at or converse with a female, lest any disturbing emotion should ruffle the serene indifference of his soul; and so important is this, that 'if his mother have fallen into a river, and be drowning, he shall not give her his hand to help her out; if there be a pole at hand, he may reach that to her; but if not, she must drown' (Wilson).

Contemplation and science or knowledge (i.e. of the concatenation of causes and effects) are ranked as virtues in Buddhism, and hold a prominent place among the means of attaining Nirvana. It is reserved, in fact, for abstract contemplation to effect the final steps of the deliverance. Thought is the highest faculty of man, and, in the mind of an Eastern philosopher, the mightiest of all forces. A king who had become a convert to Buddhism is represented as seating himself with his legs crossed and his mind collected; and 'cleaving with the thunderbolt of science the mountain of ignorance,' he saw before him the desired state. It is in this cross-legged, contemplative position that Sakya-muni is almost always represented in that crowning intellectual act of his, when, seated under the Bo-tree, he attained the full knowledge of the Buddha, saw the illusory nature of all things, broke the last bonds that tied him to existence, and stood delivered for evermore from the necessity of being born again.

'Complete' Nirvana or extinction cannot, of course, take place till death; but this state of preparation for it, called simply Nirvana, seems attainable during life, and was, in fact, attained by Gautama himself. The process by which the state is attained is called *Dhyana*, and is neither more nor less than ecstasy or trance, which plays so important a part among mystics of all religions. The individual is described as losing one feeling after another, until perfect apathy is attained, and he reaches a region 'where there are neither ideas, nor the idea of the absence of ideas.'

The *ritual* or *worship* of Buddhism—if worship it can be called—is very simple in its character. There are no priests or clergy properly so called. The *Sramanas* or *Bhikshus* (mendicants) are simply a religious order—a kind of monks who, in order to the more speedy attainment of Nirvana, have entered on a course of greater sanctity and austerity than ordinary men; they have no sacraments to administer or rites to perform for the people, for every Buddhist is his own priest. The only thing

like a clerical function they discharge, is to read the scriptures or discourses of the Buddha in stated assemblies of the people held for that purpose. They have also everywhere, except in China, a monopoly of education; and thus in Buddhist countries education, whatever may be its quality, is very generally diffused. In some countries the monks are exceedingly numerous; around Lassa in Tibet, for instance, they are said to be one-third of the population. They live in *viharas* or monasteries, and subsist partly by endowments, but mostly by charity. Except in Tibet, they are not allowed to engage in any secular occupation. The vow is not irrevocable. This incubus of monachism constitutes the great weakness of Buddhism in its social aspect. See BURMA, CHINA, LAMAISM, &c.

The adoration of the statues of the Buddha and of his relics is the chief external ceremony of the religion. This, with prayer and the repetition of sacred formulas, constitutes the ritual. The centres of the worship are the temples containing statues, and the *topes* or *tumuli* erected over the relics of the Buddha, or of his distinguished apostles, or on spots consecrated as the scenes of the Buddha's acts. The central object in a Buddhist temple, corresponding to the altar in a Roman Catholic church, is an image of the Buddha, or a dagoba or shrine containing his relics. Here flowers, fruit, and incense are daily offered, and processions are made with singing of hymns. The quantity of flowers used as offerings is prodigious. A royal devotee in Ceylon, in the 15th century, offered on one occasion 6,480,320 flowers at the shrine of the tooth. At one temple it was provided that there should be offered every day 100,000 flowers, and each day a different flower. Of the relics of the Buddha, the most famous are the *teeth* that are preserved with intense veneration in various places. Hwen-Thsang saw more than a dozen of them in different parts of India; and the great monarch Siladitya was on the eve of making war on the king of Kashmir for the possession of one, which was in consequence given up. The tooth of the Buddha preserved in Ceylon, a piece of ivory about the size of the little finger, is exhibited very rarely. See CEYLON.

There appears at first sight to be an inconsistency between this seeming worship of the Buddha and the theory by which he is considered as no longer existing. Yet the two things are really not irreconcilable; not more so, at least, than theory and practice often are. With all their admiration of the Buddha, his followers have never made a god of him. Gautama is only the last Buddha—the Buddha of the present cycle. He had predecessors in the cycles that are past (twenty-four Buddhas of the past are enumerated, and Gautama could even tell their names); and when, at the end of the present cycle, all things shall be reduced to their elements, and the knowledge of the way of salvation shall perish with all things else, then, in the new world that shall spring up, another Buddha will appear, again to reveal to the renaissance beings the way to Nirvana. Gautama foretold that Mitreya, one of his earliest adherents, should be the next Buddha (the Buddha of the future), and he gratified several of his followers with a like prospect in after-cycles. The Buddha was thus no greater than any mortal may aspire to become. The prodigious and supernatural powers which the legends represent him as possessing are quite in accordance with Indian ideas; for even the Brahmins believe that by virtue, austerities, and science, a man may acquire power to make the gods tremble on their thrones. One who is on the way to become a supreme Buddha, and has arrived at that stage when he has only one more birth to undergo, is

styled a *Bodhisatva* (having the essence of knowledge); a mere candidate for Nirvana is an *arhat* (venerable).

The Buddha, then, is not a god; he is the ideal of what any man may become; and the great object of Buddhist worship is to keep this ideal vividly in the minds of the believers. In the presence of the statue, the tooth, or the footprint, the devout believer vividly recalls the example of him who trod the path that leads to deliverance. This veneration of the memory of Buddha is perhaps hardly distinguishable among the ignorant from worship of him as a present god; but in theory, the ritual is strictly commemorative, and does not necessarily involve idolatry any more than the garlands laid on the tomb of a parent by a pious child. See TOPE.

The prayers addressed to the Buddha are more difficult to reconcile with the belief in his having ceased to exist. It is improbable, indeed, that the original scheme of Buddhism contemplated either the adoration of the statues of the Buddha or the offering of prayers to him after his death. These are an after-growth—accretions upon the simple scheme of Gautama, and in a manner forced upon it during its struggle with other religions. For a system of belief that seeks to supplant other systems finds itself enticed to present something to rival and outdo them, if possible, in every point. Even the Christian church in the middle ages adopted with this view rites and legends of paganism; merely casting over them a slight disguise, and giving them Christian names. Prayer, too, is natural to man. And then the inconsistency of uttering prayers when there is no one to hear or answer, glaring as it appears to us, is by no means great to the Eastern mind. Prayers, like other sacred formulas, are conceived less as influencing the will of any superior being to grant the request, than as working in some magical way—producing their effects by a blind force inherent in themselves. They are, in short, mere incantations or charms. Even the prayers of a Brahman, who believes in the existence of gods, do not act so much by inclining the deity addressed to favour the petitioner, as by compelling him through their mysterious potency—through the operation of a law above the will of the highest gods. The Buddhist, then, may well believe that a formula of prayer in the name of 'the Venerable of the world' will be potent for his good in this way, without troubling himself to think whether any conscious being hears it or not.

The element in Buddhism which more than any other, perhaps, gave it an advantage over all surrounding religions, and led to its surprising extension, was the spirit of universal charity and sympathy that it breathed, as contrasted with the exclusiveness of caste. In this respect, it held much the same relation to Brahmanism that Christianity did to Judaism. It was, in fact, a reaction against the exclusiveness and formalism of Brahmanism—an attempt to render it more catholic, and to throw off its intolerable burden of ceremonies. Buddhism did not expressly abolish caste, but only declared that all followers of the Buddha who embraced the religious life were thereby released from its restrictions; in the bosom of a community who had all equally renounced the world, high and low, the twice-born Brahman and the outcast were brethren. This was the very way that Christianity dealt with the slavery of the ancient world. This opening of its ranks to all classes and to both sexes—for women were admitted to equal hopes and privileges with men, and one of Gautama's early female disciples is to be the supreme Buddha of a future cycle—no

doubt gave Buddhism one great advantage over Brahmanism. The Buddha, says Max Müller, 'addressed himself to castes and outcasts. He promised salvation to all; and he commanded his disciples to preach his doctrine in all places and to all men. A sense of duty, extending from the narrow limits of the house, the village, and the country, to the widest circle of mankind, a feeling of sympathy and brotherhood towards all men, the idea, in fact, of humanity, were first pronounced by Buddha.' This led to that remarkable missionary movement, already adverted to, which, beginning 300 B.C., sent forth a succession of devoted men, who spent their lives in spreading the faith of Buddha over all parts of Asia.

In the characteristic above mentioned, and in many other respects, the reader cannot fail to remark the striking resemblance that Buddhism presents to Christianity, and this in spite of the perverse theory on which it is founded. On the other hand, by giving prominence to the extravagances and almost inconceivable puerilities and absurdities with which the system has been overloaded, it would be easy to make it look sufficiently ridiculous. But this is not to depict, it is to caricature. The only fair—the only true account of any religion, is that which enables the reader to conceive how human beings may have come to believe it and live by it. It is this object that has been chiefly kept in view in this meagre sketch of a vast subject.

For the history of the Buddha and his religion, see Burnouf, *Introduction à l'Histoire du Bouddhisme Indien* (1876); Köppen, *Die Religion des Buddha* (1857); Oldenberg, *Buddha* (1881; Eng. trans. 1882); Wurm, *Der Buddha* (1880); St-Hilaire, *Le Bouddha* (1862); Wassiljew, *Der Buddhismus* (1860); Kern, *Geschiedenis van het Buddhisme* (1884); Rhys-Davids, *Buddhism* (1880) and *Hibbert Lectures* (1881); Mills, *The Indian Saint* (1876); Arnold, *The Light of Asia* (1882); Feer, *Études Bouddhiques* (1873); Titcomb, *Buddhism* (1885); Bastian, *Der Buddha in seiner psychologie* (1882); Alvis, *Buddhist Nirvana* (1871); Sénart, *La Légende du Bouddha* (1875); Bigandet, *Legend of Gaudama* (1886); Ohry, *Du Nirvana Bouddhique* (1863); Max Müller, *Buddhist Nihilism* (1869); Lillie, *Buddha* (1881); Seydel, *Das Evangelium und die Buddhasage* (1882); Eitel, *Buddhism* (1873); Kistner, *Buddha* (1869), with a complete bibliography; Sir Monier Williams, *Buddhism* (1888); the works of Beal, Edkins, Eitel, Legge, and Schott for Chinese Buddhism; of Köppen and Schlagintweit for Tibetan; and of Alabaster for Siamese.

The following are some of the principal translations of, or compilations from original works in Pali, Sanskrit, Tibetan, and Chinese: Spence Hardy, *Manual of Buddhism* (1860), *Eastern Monachism* (1860), and *Legends and Theories of the Buddhists* (1866); Burnouf, *Le Lotus de la Bonne Loi* (1852); Schiefner, *Taranatha's Geschichte des Buddhismus* (1869) and *Lebensbeschreibung Sakjamunis* (1849); Rhys-Davids, *Buddhist Birth Stories*, vol. i. (1880); Rogers, *Buddhaghosha's Parables* (1870); Foucaux, *Histoire du Bouddha* (1868); *Fa Hian's Travels*, translations by Rénusat, Beal, Giles, and Legge; *Hsüen-Tsang's Travels* by Stan. Julien and Beal; *Lalita Vistara* by Raj. Mitra and Lefmann; *Dharmapada* by Fausbøll, Müller, Beal, Rockhill, Weber, and Schulze; parts of the canon in *Sacred Books of the East*, vols. x. xi. xiii. xvii. xix. and xxi.; other parts by C. Swamy, Childers, and Beal; Rockhill, *Life of the Buddha*; Beal, *Romantic Life of Sakya Buddha* (1875).

Buddhism, ESOTERIC. See THEOSOPHY.

Budding, a process in the propagation of ligneous plants analogous to Grafting (q.v.). It consists in the transferring of a bud from one shoot to another on the same or different plants, although chiefly employed as the most rapid and economical method of increasing new and choice or rare kinds of fruit-trees and flowering trees and shrubs; it may also be used to improve the fruitfulness of barren fruit-trees, it being quite practicable to insert

blossom-buds into the branches of trees that are deficient in them. *Shield-budding*, which is the most commonly practised of several modes, is preferred for fruit-trees with gummy sap, such as the plum, cherry, peach, and apricot, as it obviates the tendency in such trees to canker at the wounded parts. It may be performed at any time when the bark rises freely from the young wood. This it usually does from June to September, but the fitness of the bud for the operation is to be judged of solely by the freedom with which the bark separates from the wood. The bud must be well formed, but not necessarily mature. The subjoined cut

represents the various parts in the mode known as *shield-budding*: *a* is the bud cut out, with a shield of bark attached to it; *b*, the stock, with a slit in the bark to receive the shield and bud; *c*, the bud inserted and the leaf cut away. The bud is cut by means of a sharp knife from the branch on which it has grown—usually a branch of the current year's growth—a small portion of the bark and wood being taken together, extending to about half an inch above and three-quarters of an inch below the bud. The woody part is then removed from the bark, taking care to prevent the base or root of the bud from being injured. If injured, the base will present the appearance of a circular cavity, which is caused by the removal of the centre or growing point of the bud, in which case it is worthless, and should be thrown away. A longitudinal and transverse cut in the form of the letter T, as shown at *b*, are then made in the bark of the stock to receive the bud; the thin ivory point of the handle of the budding-knife is used to raise the bark, and the bud is inserted. The bark extending above the bud is then cut over so as to fit exactly the transverse cut in the stock. A strand of soft matting or soft cotton-yarn is then wound firmly but not tightly around the stock to bind the bark down on that of the bud, in order to keep the latter in its place and prevent the access of dry air or heavy rains to the wounds. Of other methods of budding, the *reversed shield* is that commonly used by nurserymen and gardeners about Genoa in the rearing of orange-trees. The only difference between this and the mode first described is that the transverse cut in the stock is made at the bottom instead of the top of the longitudinal one. *Scallop-budding* is another mode in which the wood adhering to the bark of the bud is not removed, but instead is carefully fitted to a corresponding section in the stock, made by the removal of a portion of the bark and wood. The fitting of the edges of the bark of the bud to that of the stock is essential to success in practising this method, but it is altogether less sure than ordinary *shield-budding*. It may, however, be performed in spring, and if it fails, the object in view may be attained by the other method during summer and autumn.

Buddlea, a genus of shrubs of the order Scrophulariaceae (sub-order Loganiaceae), of which eighty species are known, all natives of the warmer parts of the world, and some of them much admired for their beautiful flowers. *B. globosa* (Chili), with globose heads of orange-coloured flowers, is hardy enough to endure the climate of most parts

of England, and several half-hardy species have also been introduced.

Bude, a watering-place on the north coast of Cornwall, 17 miles NW. of Launceston. Pop. 1000. Bude Castle was the home of Sir G. Gurney, who in 1839-41 patented the *Bude burner*, consisting of two, three, or more Argand (q.v.) burners, each inner one a little above the outer. The *Bude light* was a brilliant flame produced by introducing a current of oxygen into the interior of the flame.

Budgerigar is a kind of Parrakeet (q.v.).

Budget, from the same source as the French *bougette*, means a small bag, and has been used metaphorically to express a compact collection of things, as a budget of news, a budget of inventions, and the like. Water-budgets or buckets were a very honourable blazon on a coat-armorial, as being generally conferred in honour of some valiant feat for supplying an army with water.

The term 'The Budget' is in Britain, from long usage, applied to that miscellaneous collection of matters which aggregate into the annual financial statement made to parliament by the Chancellor of the Exchequer. It contains two leading elements—a statement how the nation's account of charge and discharge stands in relation to the past, and an explanation of the probable expenditure of the ensuing year, with a scheme of the method in which it is to be met; whether by the existing or new taxes, or by loan. The statement of the budget is always an important, sometimes a very exciting occasion; as, for instance, Sir Robert Peel's adoption of an income-tax in 1842, and his legislation for free trade in 1846. Mr Gladstone's eight budgets (1859-66), when Chancellor of the Exchequer in Lord John Russell's government, have always been considered as models of financial exposition. Their principal object was to carry on the remission and reduction of indirect taxes commenced by Sir Robert Peel. Mr Goschen's budget of 1888 was also memorable. Specimen budgets of the chief countries will be found under the names of those countries, as at GREAT BRITAIN, FRANCE, &c.; see also REVENUE.

Budrun, a seaport town of Asiatic Turkey, on the north shore of the Gulf of Kos, about 96 miles S. of Smyrna. It is the site of the ancient *Halicarnassus* (q.v.), the birthplace of Herodotus and Dionysius. Pop. about 6000.

Budweis (Czech *Budejovice*), a town of Bohemia, on the navigable Moldau, 133 miles NW. of Vienna by rail. It has a cathedral, with a detached belfry dating from about 1550, manufactures of stoneware, machines, lead-pencils, saltpetre, &c., besides a brisk trade in grain, wood, coal, and salt. Pop. (1890) 28,491. In the neighbourhood is Schloss Frauenberg (1840-47), the seat of Prince Schwarzenberg.

Buenaventura, a town on the Pacific coast of the republic of Colombia. It has a hot, sickly climate, but is the port for the healthy and rich Cauca valley. Pop. 5000.

Buena Vista, a village of Mexico, 7 miles S. of Saltillo, where, on February 22-23, 1847, some 5000 United States troops under Taylor defeated 20,000 Mexicans under Santa Anna.

Buen-Ayré (Span.), Fr. BONAIRE, a West Indian island, 60 miles from the coast of Venezuela, and 30 E. of Curaçao, like which it belongs to the Dutch. It produces timber, cattle, cochineal, and salt. Area, 127 sq. m.; pop. 4043.

Buenos Ayres (*Buenos Aires*), the largest and most important province of the Argentine Republic in South America, extending along the Atlantic, from the mouth of the Plata to that of the Rio Negro on the 41st parallel. On the NE. it is washed by

the Plata and the Paraná, the latter separating it from the province of Entre Rios. Its area is estimated at 63,000 sq. m., about equal to that of Scotland and Ireland combined; its population, 648,140 in 1885, was in 1892 estimated at 102,000. With a much larger area it was originally an appendage of Pern, and became in 1775 a separate viceroyalty of itself. 'The United Provinces of the Plata' continued down to 1853 to recognise the city of Buenos Ayres as their head; and after the constitution of the Republic, the inland states endeavoured both by war and diplomacy to reannex the maritime province. Their object was attained in 1860, and the city remained capital of the province and temporary capital of the confederation until it was federalised in 1880, the seat of the provincial government being removed to La Plata, 30 miles to the south-east, in 1884. The province is divided into 80 departments, and returns 16 of the 86 members of congress, the city sending 9 more. The public debt of the province amounts to £35,000,000. The annual budget is about £2,000,000, and is usually much exceeded by the expenditure.

The country approaches so nearly to a plain, with only two ranges of hills, 660-3830 feet high, that most of the rain which falls is either absorbed or evaporated, or lost in salt-lakes, comparatively little drainage entering the Paraná or the Plata; the largest rivers, the Salado (360 miles), and the Negro (630) and Colorado (700) in the south, empty into the Atlantic. The climate, though on the whole healthy and agreeable, is yet by no means steady or uniform. Every wind, in general, has, to a remarkable degree, its own weather—sultriness coming from the north, freshness from the south, moisture from the east, and the dry and piercing *pampero* winds from the west; and besides the periodical heats of every summer, successive years of more than ordinary drought occur. The rainfall ranges from 19 inches at Bahía Blanca to 38 at Matanzas; snow falls only in the far south, though thin ice is occasionally seen, the temperature ranging from 24° to 108° F. Agriculture, properly so called, is followed chiefly in the more temperate and humid districts of the eastern coast, and in those to the west and south-west of the capital, where most of the Scottish and Irish immigrants have settled; there were about 2,500,000 acres under cultivation in 1891, and land has lately greatly increased in value. The interior presents almost uninterrupted pasturage to countless herds of horses and cattle, and the business of grazing occupies or interests the great bulk of the population; but the droughts that affect the high northern camps, as well as the frequent inundations to which the low-lying southern camps are exposed, are often more destructive to the herds than the not infrequent plague of locusts is to the crops. The coast-line (740 miles, with about 150 miles on the Paraná) is low and sandy, and the ports of the province are very few. The harbour of the city of Buenos Ayres is very bad, and Bahía Blanca, in the extreme south, is little frequented. Under the circumstances, a commercial future of some importance is anticipated for the newly-founded La Plata, which possesses a harbour at once commodious and easily accessible. Immigration from Europe has been warmly encouraged by legislative enactment; and a comparatively congenial climate, as a recommendation to foreigners, has powerfully seconded the efforts of liberality and patriotism. In 1887 a bill was passed for establishing 'agricultural colonies' at all railway stations within 60 miles of the capital, where towns did not already exist; and here farm lots were to be marked out at a very low cost. The annual immigration into Buenos Ayres averaged only 40,000 for the twelve

years preceding 1882; but since then it has greatly increased, and in some years has exceeded 100,000 (60 per cent. Italian, 15 per cent. Spanish), although a proportion of the immigrants went on to the agricultural colonies of Santa Fé and Entre Ríos. Several railways, with about 1000 miles of road, traverse Buenos Ayres; and over the less populous routes about seventy lines of stagecoaches run. There are 6150 miles of telegraph wires in the province. Besides those mentioned, the only town of any importance is San Nicolás, on the Paraná, with a population of over 10,000. See Mulhall's *Hand-book of the River Plate* (6th ed. 1892).

Buenos Ayres, the federal capital of Argentine Republic, on the right bank of the Plata, which here, at a distance of 150 miles from the open sea, is 28 miles across, but so shallow that ships drawing 15 feet of water are obliged to anchor 7 or 8 miles from the shore. It has other great disadvantages as a maritime town: the flood-tides of the ocean, when backed by easterly winds, are apt to make the estuary overflow its banks; and again, when westerly winds prevail, the estuary loses both width and depth. Monte Video, on the opposite shore, possesses a better harbour, and would, but for the greater facilities of Buenos Ayres in carrying on an inland trade, have proved a dangerous rival. Of the trade, however, with Chili by Mendoza and the Andes—a trade which must always be carried on by land—Buenos Ayres must still command the monopoly. Moreover, an elaborate system of harbour works was carried out between the years 1887-95, at a cost of £4,000,000; it includes an advanced river wall, a north and south basin, and a series of four docks, which connects two channels of the Plata, and so brings large vessels up to the wharfs. The city has had to contend against some peculiar disadvantages. Until recently, its supplies of fresh water were received from the Plata in rudely constructed carts; and although some granite is now forwarded from Jandil, 180 miles to the south, its immediate territory, purely alluvial, is almost as destitute of stones as of timber—the former being principally brought either as ballast from Europe or as freight from Martin Garcia, an island on the opposite side of the estuary, and the latter from Entre Ríos and the Gran Chaco, and from the islets of the Uruguay and the Paraná. Fuel is almost as scarce as building material—peach-trees, charcoal brought from the coast, and the withered thistles of the prairies yielding the only indigenous supplies. The city, including suburbs, contains (1894) 592,328 inhabitants—about a third of whom are of European birth or descent. Among the Europeans the vast majority are Italian; the rest are principally Spanish, French, and British. Newspapers are published in French, English, Italian, and German, as well as in Spanish. The city is partitioned into blocks of about 150 yards square, with muddy, uneven roads, and pavements under chronic repair. In 1887 plans for a grand boulevard through the heart of the city were adopted; there are about a dozen plazas of from 8 to 12 acres in size; new houses, generally of brick faced with marble or stucco, are everywhere taking the place of the old comfortless Spanish-American erections, and the value of property has enormously increased. The principal buildings are the cathedral, second in South America to that of Lima alone, the chapel of Santa Felicitas, with elaborate frescoes, Anglican, Lutheran, Methodist, and Presbyterian churches, the university, the congress-hall, a military college, the new post-office, the residence of the governor, the archbishop's palace, the mint and government offices, and some of the banks and palatial railway depôts. There are also printing establishments;

manufactories of cigars, carpets, cloth, furniture, and boots and shoes; some small dockyards; and an Emigrants' Home, where about 7000 immigrants annually are received. The city is the seat of an archbishopric, and possesses several public libraries and museums, eleven hospitals, and numerous other charitable institutions. The terminus of six railways, it has some 100 miles of tramway lines; there is cable communication with Europe and the United States; and one telephone was in 1888 in use for every 173 of the population. The drainage is well planned, and the water and gas supply excellent, only the suburbs being still lit with oil-lamps, and supplied with water by the carriers. The exports (one-sixth to England) and imports (about one-half British) are practically those of Argentine Republic (q.v.), and there is besides a considerable trade by the river. The debt of the city amounts to over £15,000,000. In 1890-95 the annual revenue, about £1,000,000, did not nearly meet the expenditure. There was a Continental Exhibition held here in 1882. Buenos Ayres was founded in 1535, but was subsequently twice destroyed by the Indians. In 1806 a British force, which had just captured the city, was obliged to surrender; and in 1807 another, which attempted to recover the place, was repulsed with heavy loss; and these successes over so formidable a foe emboldened the colonists, three years afterwards, to throw off the yoke of Spain.

Buffalo, a city of New York state, capital of Erie county, is at the east end of Lake Erie, and at the head of Niagara River, in 42° Copyright 1888 in U.S. by J. B. Lippincott Company. 53' N. lat., and 78° 55' W. long. It is about 295 miles NW. of New York city in a direct line, but by the Erie Railroad 423 miles; the distance from Chicago is 539 miles. In population and wealth, Buffalo ranks fourth among the cities of New York. It has a capacious harbour, which has been dredged so that vessels of 17 feet draught can enter. There is an outer breakwater 4000 feet long, besides other breakwaters, piers, basins, and canals, constructed by the Federal, state, and municipal governments, at an expense of many millions of dollars. The harbour is guarded by Fort Porter, which stands two miles out from the heart of the city; close by is the old fort, built in 1812, and now in ruins. Two miles below, at Black Rock, long since included in the city, is the International Iron Bridge by which the Grand Trunk Railroad crosses the Niagara River. The water front of the city extends 5 miles along the lake and river, while Buffalo Creek has been rendered navigable for over a mile. The commercial importance of Buffalo dates from the completion of the Erie Canal in 1825; but since 1862 the lake commerce has yielded to the competition of the railroads. The Board of Trade was incorporated in 1857. The chief business is the receiving, transferring, and storing of grain, which employs over thirty elevators, some of them stone structures, others iron and brick, with a total capacity of over 8,000,000 bushels. There are also large floaters and transports, some of which have a capacity of 60,000 bushels. The annual amount of grain (including flour) received by lake and railroad is from 70,000,000 to 90,000,000 bushels. The live-stock trade, in which Buffalo ranks third among the cities of the Union, bids fair shortly to exceed the grain trade in importance; the iron and steel works rank next to those of Pittsburg; and the shipments of Pennsylvania coal, which finds a depot here, have greatly increased in recent years, about 1,500,000 tons being distributed yearly. The lumber trade is also large, but has been partly diverted to Tonawanda, 10 miles below Buffalo, where more room is afforded. The industrial works comprise four blast-furnaces, large rolling-mills,

machine-shops, car-shops, iron shipyards, stove-foundries, tanneries, breweries, flour-mills, and manufacturing of agricultural implements, besides many small establishments of all kinds. The navigation of Lake Erie usually opens about the middle of April, the extreme dates being a month earlier and a month later. Main lines of railroad connect Buffalo with New York, Philadelphia, Chicago, and Canada. In November 1896 electric power generated at Niagara Falls was rendered available for factories and tramways in Buffalo. The city has wide streets, well paved and lighted, and generally lined with trees. It has excellent sewerage, and extensive water-works supplied from Niagara River; and its healthfulness is attested by the low death-rate of 14 per 1000. There are five public squares, and the magnificent park consists of three sections, connected by boulevards which encircle the city. Delaware Avenue, the leading street for private residences, is about 3 miles long, and is lined with double rows of trees. Main Street, the principal trading thoroughfare, has many substantial business blocks. The city and county hall is an imposing structure of Maine granite, in the form of a double Roman cross, with a tower 245 feet high, surmounted by four statues. The other prominent buildings are the United States custom-house and post-office, the state arsenal, the county penitentiary, and a state asylum for the insane (in North Buffalo), which has accommodation for 600 patients. Of the two finest of its 100 churches, St Joseph's Cathedral (Roman Catholic) is a gray Gothic structure; and St Paul's (Episcopal), in brown stone, was burned in 1888. Among the others are 21 Catholic, 15 Methodist, 12 Episcopalian, 12 Presbyterian, 11 Baptist. The public schools comprise 36 district schools, a state normal, and the Central High School. The Catholics have Canisius College, conducted by Jesuits, and St Joseph's, by the Christian Brothers, besides convents and parochial schools. Among the private schools, the most noted is the Buffalo Female Academy. There are also a medical college and several business colleges. A number of daily newspapers are published, nearly half of them in German. The Grosvenor Free (reference) Library has over 25,000 volumes; the Young Men's Association has 45,000 volumes, and its building gives accommodation also to the library and interesting collections of the Historical Society (founded in 1862), the Society of Natural History, and the Mechanics' Institute. There are also a Fine Arts Academy, Young Men's Christian Union, and Catholic Institute. Among the charitable institutions are six hospitals, a dispensary, and orphan asylums. There are twenty-one cemeteries, the finest being Forest Lawn, with 75 acres.

Buffalo was founded in 1801 by the Holland Land Company. It was burned in 1813 by British and Indians. It was incorporated as a city in 1832, and had then a population of 15,000, which had increased in 1850 to 42,300; in 1860 to 81,130; in 1870 to 117,714; in 1880 to 155,137; and in 1890 to 255,664.

Buffalo, a name often applied to two distinct bovine genera or sub-genera—viz. the Asiatic Buffalo (*Bubalus*) with the Cape Buffalo; and the American Buffalo, better called Bison, and discussed under that head. The genus or sub-genus *Bubalus* has the usual bovine characteristics, and whatever be its exact limits in strict zoological classification, remains for practical purposes a large, clumsy ox. The horns rise from the posterior side corners of the skull, are usually thickened out of proportion at the base, and irregularly ridged, though smooth towards the points; the forehead is short and arched; the covering of hair is comparatively sparse. The

common or Asiatic Buffalo (*B. buffelus*) has beautifully twisted horns, thick and broad at the base, rough on to the middle, somewhat triangular in section. The horns lie back on the shoulders when the animal walks or runs, with its muzzle projecting characteristically forwards. The hair is short and scanty, almost bristly, slightly longer on head, shoulders, and front of neck, and all but black in colour. The bare brown polished hide is, however, the more striking feature.

The animal measures about 7 feet in length, and stands about 4 feet high at the shoulder. It is a native of the East Indies, has been domesticated in India, and thence introduced into Egypt, Greece, Italy, Hungary, &c. It is said to have reached Italy towards the end of

Head of the Asiatic Buffalo
(*Bubalus buffelus*).

the 6th century A.D., and there it has been its fate, as elsewhere, to become a beast of burden. The animal is adapted for marshy situations, which it naturally affects; preferring for its food the rank coarse herbage which they afford, delighting to immerse itself in water till only its head appears above the surface, in which condition it will remain for hours. It often envelops itself in mud as a protection against insects. On account of these propensities, the buffaloes used as beasts of burden in India are seldom laden with any goods liable to be spoiled by water, as the animal is always ready to take an opportunity of lying down with his load in any river or pond which presents itself. In Italy the buffalo seems nowhere more at home than in the Pontine Marshes and the pestilential Maremma.

The buffalo is a very powerful animal, much more powerful than the ox, and capable of dragging or carrying a far heavier load. The female yields a much greater quantity of milk than a cow, and of excellent quality. It is from buffalo milk that the *ghee* or semi-fluid butter of India is made. The hide is greatly valued for its strength and durability, but the flesh is decidedly inferior to that of the ox.

The buffalo exhibits a considerable amount of intelligence. In a state of domestication, it is capable of becoming very docile. In a wild state the buffalo is savage and dangerous, and even in domestication it is apt to resent injury. Alone, perhaps, of wild animals in India, it will attack unprovoked. The native princes of India make buffaloes and tigers fight in their public shows; and the buffalo is more than a match for the tiger, even in single combat. The buffalo is used in some parts of the East in the shooting of waterfowl; the sportsman conceals himself behind the animal, which, being a familiar sight, does not alarm the birds.—The Arnee is a very large variety of the common buffalo; a head has been known to measure 13 feet 6 inches along the horns. It occurs in the Indian islands and in Farther India in a wild state, but is also domesticated and used as a beast of burden.

The Cape Buffalo (*Bos caffer*) is generally regarded as a distinct species. The horns are very large; they spread horizontally over the top of the head, and are then bent down laterally, and turned upwards at the point. The head is carried, as by the common buffalo, with projecting muzzle and reclining horns, but the bases of the horns nearly meet on the forehead, where they are from 8 to 10

inches broad. The length of a full-grown Cape buffalo is about 8 feet from the root of the horns to the tail, and the height is 5½ feet. This animal

The Cape Buffalo (*Bos capensis*).

is regarded as more formidable than any other in South Africa. The buffalo is still found in large herds in the marshy wooded regions of Mid and South Africa, but in Cape Colony, where it was once plentiful, it has now become comparatively rare. It grazes chiefly in the evening, and lies in woods and thickets during the day. It will readily act on the aggressive, and has never been domesticated. The flesh though coarse is palatable.—*B. brachyceros* is another African species.—The Dwarf Wild Cow of the island of Celebes (*Anoa* or *Probubalus celebensis*) is also related to the buffaloes.

Buff Leather, or OIL-DRESSED LEATHER, is usually made out of salted and dried South American light ox and cow hides. After being limed in the usual way, they are unhaired and rounded, so that only the best part of the hide is made into buff leather. The grain and flesh being then scraped or cut off, the true cuticle, which is of a flexible fibrous nature, alone remains. The hide is next sprinkled over with cod-oil, and placed in the *stocks*, where it is worked for about 15 minutes. Having been taken out and partially dried, it is again submitted to a similar process of oiling and stocking; and during the first day these operations may be repeated six times, decreasing daily for about a week, when one oiling and stocking in a day is sufficient. The gelatin of the hide combines with the oil, heat being evolved in the process. The hides are then placed in a stove, and subjected to an operation called 'heating off,' after which they are scoured and rendered free from oiliness by being soaked in a strong lye of carbonate of potash. They are next worked well in the stocks, hot water being poured copiously upon them until the water runs off pure. Having been dried, they are subjected to a process called *grounding*—i.e. they are rubbed with a round knife, and also with pumice-stone and sand, until a smooth surface is produced. The leather, which is very pliant, and not liable to crack or rot, is now ready for the market, and is generally used for soldiers' belts and other army purposes. Buckskin and chamois or wash-leather are dressed in a similar way.

Buffon, GEORGE LOUIS LECLERC, COMTE DE, was born at Montbard, in Burgundy, on September 7, 1707. His father was a rich man, belonging to the *noblesse de robe*. After studying law at the Jesuit college in Dijon, he devoted himself wholly to science. At Dijon he became acquainted with

an English nobleman, Lord Kingston, with whom he went on a tour through France and Italy, and in whose company he visited England. While in England he translated into French Newton's *Flucions*, Hales's *Vegetable Statics*, and a work on agriculture by Tull. On returning to France he soon gained distinction as a writer on scientific subjects, and after being admitted to the Academy, was in 1739 appointed director of the Jardin du Roi, a post which gave him command of the royal museums and collections of living animals and plants. He then formed the design of his *Histoire Naturelle*, in which all the known facts of natural science were to be embodied and discussed in what he believed to be language of the loftiest eloquence. In producing the fifteen volumes of the *Histoire*, which appeared between 1749 and 1767, he was assisted by Daubenton, the Abbé Bexon, Guesneau de Montbéliard and others, whom he intrusted with the compilation of facts, and the composition of the less ambitious passages. The work brought him an immense reputation, and was translated into most of the languages of Europe. Its rhetorical flights were regarded with extravagant admiration: Rousseau, who visited Buffon at the chateau of Montbard, is said to have fallen on his knees and kissed the doorstep of the pavilion in which parts of the book were composed. Montesquieu, D'Alembert, and Voltaire, however, formed a different estimate of its author's ability. Though he may be ranked among the *philosophes*, Buffon was not one of the leaders or militant members of the party. After receiving various high honours, he was made Comte de Buffon by Louis XV. He died at Paris on April 16, 1788. Buffon, it has been said, completely exemplified his own phrase: *Le style c'est l'homme*. He was as pompous in his manners as in his writings. He regarded himself as a supreme authority on all that related to literary form; his remark, however, that certain verses which he happened to admire were as beautiful as beautiful prose, illustrates his thorough misunderstanding of the principles of sound criticism. After being greatly overrated, his work is now, perhaps—at least out of France—somewhat unfairly disparaged. He was rash and over-confident in his speculations; his book has no longer any scientific value; much that he wrote and that once passed for soaring eloquence is now recognised as fustian. But he was inspired by a genuine love of knowledge. He sought to invest natural science with new dignity and interest in the eyes of the world at large, and he undoubtedly achieved his object. He may claim a place in the history of the doctrine of evolution, from having opposed the old system of zoological classification, on the ground that an unbroken succession of forms could be traced through the animal kingdom.

See Richard's edition of his *Œuvres complètes* (1825-28), his *Correspondance* (2 vols. 1860); Flourens, *Buffon*; *Histoire de ses Travaux et de ses Études* (1844); Nadault de Buffon, *Buffon, sa Famille et ses Familiers* (1863); and the Life by Lebasteur (1889).

Buffoon is a Jester (q.v.), from the Ital. *buffa*, 'a trick.' From the same word comes *buffo*, 'a comic actor or singer;' and the French name, *opéra-bouffe*, for comic opera.

Bug, the name of two Russian rivers. The Western Bug rises in Austrian Galicia, and after a course of about 470 miles, forming for the most way the eastern frontier of Poland, it joins the Vistula, near Warsaw. The Eastern Bug, the Hypanis of the ancients, rises in Podolia, and flows 520 miles south-east into the estuary of the Dnieper.

Bug, a popular name for insects in the order Hemiptera, and in the subdivision with unequal wings—Heteroptera. It may be widely applied to

the whole of this subdivision, including land-bugs and water-bugs, the former to the number of almost 8000 species, the latter much less numerous. The Boat-fly (q.v.) or water-boatman has been already described, and may, along with the water-scorpions (*Nepidae*, q.v.), serve to illustrate the water-bugs. The Geocôres or land-bugs vary considerably, but have large long feelers with four or five joints, are especially at home in warm countries, are often brightly coloured, have an unpleasant smell, and usually eat other insects or sometimes also the juices of plants. The bug *par*

Cimex lectularia.

excellence, however, is the *Cimex* or *Acanthia lectularia*, the well-known bed-bug. It was known to the Greeks as *Koris*, to the Romans as *Cimex*, and was believed by Aristotle to arise spontaneously from sweat. It is a wingless insect, thus differing from most of its fellow bugs. The body is very flat, the long slender feelers and the legs with fine hairs, the posterior part of the body almost circular. The length is about $\frac{3}{4}$ of an inch. The colour is rusty red, with traces of yellow. The mouth is suctorial. During the day the insect lurks quietly in crevices of walls and bedsteads, but is active and hungry at night, sucking the blood of higher animals, and notoriously of man. Since such opportunities but rarely occur, the animal prepares for long fasting by distending itself with blood when a meal is offered. As pests, they are too well known, especially where the furniture is not kept clean, and exasperated sleepers are no longer able to console themselves with the old belief that the bite was an antidote to the venom of snakes. The female bug is said to lay eggs four times between March and September, and each time about fifty. The larvae are in most respects like the adult, the metamorphosis being incomplete. The first three broods, each reaching sexual maturity in about eleven weeks, develop, the last brood appears to perish, while the adult insects persist through the winter, enduring a considerable degree of cold. The bed-bug is said to have come from the East, and it certainly follows human migration. It was not known in Strasburg, according to Lennis (*Synopsis des Thierreichs*), till the 11th century, and the refugee Huguenots have been blamed for bringing it to London. Strict cleanliness is the best preventive; turpentine and even corrosive sublimate are among the recommended insecticides. The same species is known to attack pigeons, and other species trouble bats and swallows. For an account of the bug family as a whole, systematic works on insects must be consulted. Many of the thousand forms have some scientific interest and practical importance. A large number may be studied on our common plants and trees. Some of the winged wood-bugs or field-bugs are capable of inflicting very painful wounds. Forms an inch in length are known to occur. Flying-bugs, 'enormous and fetid,' are among the pests of India. Night is the time of their activity. Warm countries generally have winged bugs of great size and beauty; but if touched or irritated, they 'exhale an odour that, once perceived, is never after forgotten.' A winged bug, as large as a cockchafer, lodges in the thatch and roofing of houses in Chili, and sallies forth at night, like the bed-bug, to suck blood, of which it takes as much as a common leech.—It is worthy of notice that a species of field-bug (*Acanthosoma*

griseum), a native of Britain, is one of the few insects that have yet been observed to show affection and attention to their young. De Geer observed the female of this species, which inhabits the birch-tree, conducting a family of thirty or forty young ones as a hen does her chickens, showing great uneasiness when they seemed to be threatened with danger, and waiting by them instead of trying to make her own escape.

Bugbane, or BUGWORT (*Cimicifuga*), a fetid genus of Ranunculaceæ, allied to Baneberry (*Actæa*), of which both the European and American species are said to drive away insects.

Bugeaud, THOMAS, French marshal, was born at Limoges in 1784, and entering the army in his nineteenth year, showed such bravery during the Napoleonic campaigns as by 1814 earned him a colonelcy. Recalled from a fifteen years' retirement to active life by the July revolution of 1830, he was elected deputy for Perigueux, and soon gained Louis-Philippe's esteem; in 1836 was despatched to Algeria, where he distinguished himself against Abd-el-Kader; and in 1840 was appointed governor-general. The Zouaves owed their organisation to him. His victory at Isly in 1844 over the emperor of Morocco's forces gained him the title Due d'Isly, and the year before he had received the marshal's *bâton*. In the revolution of February 1848 he commanded the army in Paris. He died of cholera in Paris, June 9, 1849. See his *Memoirs* by Count d'Iderville (Eng. trans. 2 vols. 1882); and Roches, *Le Maréchal Bugeaud en Afrique* (1885).

Bugenhagen, JOHANN, surnamed *Doctor Pommeranus* or *Pommer*, one of Luther's chief helpers in the Reformation, was born in 1485 near Stettin, in Pomerania, studied at Greifswald, and as early as 1503 became rector of the Treptow academy. In 1520 his religious views were changed by reading Luther's little book, *De Captivitate Babylonica*. He now betook himself to Wittenberg, where he busied himself in preaching and teaching in the university. His great talent for organisation found work to do in establishing churches in Brunswick, Hamburg, Lübeck, and Pomerania, and in reforming the ecclesiastical establishments of Denmark, whither he was called by Christian III. in 1537. He died 20th April 1558. Bugenhagen aided Luther in his translation of the Bible. Of his own works the best is his *Interpretatio in Librum Psalmorum* (1523). His Life has been written by Bellermann (1859), Vogt (1868), and Zitzlaff (1885).

Bugge, ELSSENS SOPHIUS, a Norwegian philologist, born 5th January 1833 at Laurvik, studied at Christiania, Copenhagen, and Berlin, and in 1866 was appointed professor of Comparative Philology and Old Norse at the university of Christiania. His *Old Norse ballads* (1858) and historical legends (1864-65), critical edition of the earlier *Edda* (1867), studies in ancient Italian dialects (1878) and on the origin of the Scandinavian legends of gods and heroes (1881-82), besides numerous dissertations on all departments of the Teutonic and Romance languages, place him in the first rank of living philologists.

Buggy (an Indian word) is a gig with a hood in India; in England it is a light two-wheeled vehicle without a hood; but in the United States is a light one-horse four-wheeled vehicle with a hood.

Bugis. See BOXI.

Bugle (*Ajuga*), a palaearctic genus of Labiataæ. The Common Bugle (*A. reptans*) is abundant in moist pastures and woods of Europe. Its flowers are generally blue, but white and purplish varieties are sometimes grown in flower-borders. *A. alpina* is one of the beautiful flowers of the Swiss Alps.

Bugle (Fr. *bugle*; Ger. *flügelhorn*; Ital. *tromba*), a treble musical instrument with a cup mouthpiece, usually made of copper, with strengthening pieces of brass soldered on where most exposed to wear. The bell is less expanded than the Trumpet (q.v.), and the tube is shorter and more conical. (Compare the figure with those in the articles CORNET and TRUMPET.) This form gives it that peculiar,

Bugle.

penetrating, and far-reaching sound which renders it so admirably suited for its sole purpose—viz. a military signalling instrument. The bugle was formerly used only in the infantry branch of the service; but it has now superseded the trumpet for field duty in the cavalry and artillery branches.

It is made in the key of B \flat , and its notes are the

open notes of the tube—C (below the stave), G, C, E, G. It has also C, octave lower, and B \flat and C above; but the first five are the only effective notes. It is provided with two rings, to which a cord is attached for suspension to the shoulder of the bugler. See BAND (MILITARY).

The *Kent bugle*, a bugle with keys to provide the additional notes (see MUSIC—*Musical Instruments*), was at one time very popular as a leading instrument in brass bands. It was, however, difficult to play, and another modification, the *valved bugle*, was introduced. Both are now entirely superseded by the Cornet (q.v.) as a leading instrument, except in the purely bugle-bands of some of the rifle regiments. A valved attachment to fit on to the ordinary bugle, to enable it to be used as a band instrument, has also been invented, but little use has been made of it.

Bugle sounds or *calls*, as the military signals are called, are all written within the compass of the five principal notes of the bugle. They vary in character from a single note G, meaning 'right' (two Gs being 'centre,' and three 'left'), to the infantry 'veillee,' or morning call, which may be said to have some pretensions to being a musical composition, as it has five movements, a largo, allegretto, vivace, adagio, and presto. The soldiers display much ingenuity and considerable humour in adapting words to many of the calls. We append a few of the 'sounds' as specimens:

INFANTRY SOUNDS.

CAVALRY AND ARTILLERY SOUNDS.

Bugle is a name for a slender, elongated kind of Bead (q.v.), usually black.

Bugloss, a name popularly applied to many plants of the natural order Boraginaceae (q.v.), more strictly to *Anchusa* (*Lycopsis*) *arvensis*, a common weed in cornfields in Britain. The beautiful *Echium vulgare* bears the English name of Viper's Bugloss. Both these plants are naturalised in the United States.

Bugulma, a town in the Russian government of Samara, on the Bugulminka, a tributary of the Kama. Pop. 13,400.

Buguruslan, a town in the Russian government of Samara, on the Kinel, in the great Volga steppe, with 20,511 inhabitants.

Buhl or **Boule Work**, the name applied to a sort of inlaying of brass scrolls and other ornamental patterns in wood. The name is derived from its inventor, Charles André Boule (1642–1732), an Italian cabinetmaker in the service of Louis XIV. He employed veneers of dark-coloured tortoise-shell, inlaid with brass. Cabinets of his manufacture are highly prized, as are also those of his contemporary Reisner, a German, who used a ground of tulip-wood, inlaid with flowers, &c. in darker woods, and varied with margins and bands of light wood, with the grain crossed for contrast. This modification of buhl-work is correctly called

Reisner work. For details of the methods of working, see INLAYING, and MOSAIC; also MARQUETRY.

Buhrstone, a variety of Quartz (q.v.), containing many small empty cells, which give it a peculiar roughness of surface, particularly adapting it for millstones. The name is given without reference to geological relations, but it is *vein quartz*, rather than true *quartz rock*, which ordinarily assumes the character of buhrstone. There are different varieties of buhrstone, some of which are more compact, or have smaller cells than others; and those in which the cells are small and very regularly distributed, about equal in diameter to the spaces between them, the stone being also as hard as rock-crystal, are most esteemed. Good buhrstone is found at Conway in Wales, and at several places in Scotland, as well as near Cologne in Germany. Buhrstones are quarried in New York, Pennsylvania, and North Carolina. But the finest millstones are obtained from the quarries of La Ferté-sous-Jouarre, in the department of Seine-et-Marne, near Paris. It is not unusual to form millstones of pieces of buhrstone cut into parallelopipeds, like great wedges of soap, and bound together by iron hoops. The stone is found in beds or in detached masses, and the mode of quarrying is peculiar. When the mass is large, it is cut out

into the form of a huge cylinder; around this grooves are cut, at distances of about 18 inches, the intended thickness of the millstones; into these grooves wooden wedges are driven, and water is thrown upon the wedges, which, causing the wood to swell, splits the cylinder into the slices required. —Millstones are sometimes made of siliceous grit-stones, of sandstone, and even of granite (see MILL). Buhrstone millstones are extremely durable.

Building. The walls of a house may be built of wood, stone, brick, brick and timber, iron, mud, turf, and even snow. In the arctic regions a house with snow walls is felt to be fairly comfortable. In the tropics a strong tent constructed of posts and palm-leaves suffices for an abode. The following tradesmen take part in the erection of an ordinary dwelling-house: Mason or bricklayer, marble-cutter, carpenter, joiner, slater, plasterer, glazier, smith or founder, plumber, gas-fitter, painter, and bell-hanger.

Site and Foundation.—If there is a choice of site, one should be chosen with a dry subsoil and good natural drainage. Where ground has been made up artificially, it should either be carefully avoided, or the tracks for the foundation courses of the walls must be sunk till they reach the natural stratum of earth or surface of rock. In certain situations, as where the ground is marshy, wooden Piles (q.v.) are used to carry walls. However dry the ground may be, a 'damp-proof course' should be formed a little above the level of the ground by levelling the walls and spreading a thin layer of asphalt over them, or by laying a course of glazed pottery slabs. The damp-proof course should be below the lowest flooring-joists. See FOUNDATION, and ASPHALT.

Walls.—For buildings such as churches and houses in most civilised countries, walls are nearly always constructed of brick or stone. But in Norway, Sweden, Russia, and Switzerland, as well as in parts of Asia and America, many houses, and in some cases churches, are erected entirely of wood (see CHALET). Another way of constructing walls has recently been adopted largely on the continent of Europe, and to some extent also in America. This consists of a concrete (called *béton* in France) formed of sand, pebbles, broken stone, and lime mixed with water. It is a revival of an ancient Roman method, and, on the Continent especially, has produced satisfactory results. Stone walls for ordinary houses are usually built two feet thick, but they are often made much thicker in the case of large public buildings. Their Masonry (q.v.) is either of Ashlar (q.v.) work or of Rubble (q.v.), jointed with mortar, which is also used for brickwork (see CEMENTS). The external brick walls of some houses are only 9 inches thick, but they should be at least 14 inches thick, especially if the building is two stories or more in height. They are often built hollow—i.e. with hollow spaces formed in their thickness—which tends to keep down damp (see BRICKLAYING). Drains, chimneys, and stairs are referred to under their respective heads. For the construction of arches, see BRIDGE.

Partitions.—On the ground-floor, and wherever strength of construction is required, these are best formed of brick, usually $4\frac{1}{2}$ inches, occasionally 6, and sometimes 9 inches thick. They are now occasionally built of hollow bricks. Wooden partitions are formed of upright quarterings or studs, called in Scotland standards, $4\frac{1}{2}$ by 2 inches, and from 12 to 14 inches apart, and covered with lath to receive plaster. In Great Britain these timber partitions are left hollow, but in Paris the quarterings are nailed over horizontally with strong oak laths a few inches apart, and all the interspaces filled in with

stone rubble. A plaster of Paris mortar is then pressed through the rubble, leaving as much body on the surfaces as will cover and imbed all the timber, and in this way form a solid partition.

Flooring.—The lowest floor, if formed of wood, should be above the level of the ground, should have a space below the joists, and air should be admitted by openings through the walls for ventilation. If this is not done, the timber is apt to be attacked by dry-rot, caused by a species of fungus. Floors near the level of the ground, when laid with flag-stones, asphalt, or cement, require a six-inch layer of broken stones, covered with a bed of mortar or cement below them. All the floors of a house, except in some apartments of the lowest story, are usually formed of wood; but if they are of large size, the joists are often supported by iron beams (see GIRDER). Floors whose under sides form ceilings of rooms below them require to be 'deafened' with a layer of some mixture such as coarse plaster, mortar, and chopped straw, or of ashes and lime, under the flooring-boards. In large or important buildings floors are often constructed of either solid or hollow brick arches thrown between iron beams, in which case they are fireproof. See FLOOR.

Roofing.—For large spans iron roofs are a feature of the age, and the French have been particularly successful in the artistic treatment of this material; but wooden roofs are commonly put on ordinary houses. Where it is available, Slate (q.v.) is for the most part used to cover sloping roofs, but occasionally thin flagstone takes the place of slate. Tiles of red, blue, and other colours are now sometimes chosen, even for the roofs of public buildings, in preference to slate when colour effect is sought after. Flat roofs are covered with lead or zinc, the former being the more durable. The gutters, flushings, and generally the ridges of roofs, are of lead; but they are frequently made of zinc, which does not last long in large towns, although it is more durable in the country. Thatch, felt, Asphalt (q.v.), and wooden Shingles (q.v.) are all used to cover roofs; and glass is largely used in roofs of railway stations, exhibitions, and the like.

Joiner-work.—Doors, windows, shutters, and generally what are called the internal finishings of a house, are made and fitted up by the joiner.

Information on other points of interest will be found at FIRE, GAS-LIGHTING, TIMBER, VENTILATION, WARMING, and WATER-SUPPLY, besides those elsewhere referred to in this article.

Plaster-work.—The covering of the internal surface of walls, and the surface of partitions and ceilings with plaster, as well as the construction of the cornices and other modelled decorations of rooms in plaster of Paris, is done by the plasterer. The inside of external stone and solid brick walls should be strapped and lathed before being plastered, otherwise it is difficult to keep the plaster dry.

Plumber-work.—Much of the comfort of a house depends upon the efficiency with which the plumber does his work. The lead water-pipes should be placed in situations protected from frost, and they should be of a sufficient thickness to stand the required pressure. Lead piping is not very suitable for the conveyance of hot water (see LEAD). Easy access should be given to water-cisterns, in order that they may be frequently cleaned. All the fittings of cisterns, baths, and water-closets, and soldered joints everywhere, require the utmost care and attention. A very small hole, through which an almost invisible drop of water can escape, will often cause much damage before it is detected. The lead and zinc work of roofing noticed above is done by the plumber. Zinc baths are not so common as they were, enamelled iron ones being

preferred to them; but those made of strong earthenware, with a white glaze, are perhaps the best of all, as a glaze on burnt clay does not chip like an enamel on metal. Excellent kitchen-sinks are also made of glazed earthenware, but those formed of lead on a wood framing have also advantages, and have been longer in use. Such questions as the non-desirability of having fixed wash-hand basins in bedrooms, and the trapping of pipes which enter drains, will be treated of under the head SEWAGE.

Gas-fitting.—The gas-pipes of a house should be of tin, as it is harder and stands much better than the cheap composition tubing, made of a mixture of lead with other metals, now so much used. Unless they are formed of iron, gas-pipes should be placed in protected channels, and not exposed on the surface of walls. Leaks in tin or other more or less soft-metal pipes are frequently caused by the carelessness of joiners driving nails through them. It occasionally happens that rats gnaw through these kinds of pipes when they are in their way, and they more frequently destroy lead water-pipes in the same manner. In order to be sure that the gas-pipes in a house are perfectly airtight, they should be tested with a force-pump and an indicator.

Glazing.—Windows of houses are most commonly glazed with sheet-glass varying in weight from 15 to 26 ounces per superficial foot. Thicker kinds are made for very large-sized panes. When plate-glass is used, it is generally about one-fourth of an inch thick. In some shop windows it is considerably thicker. Few persons, except those who have much experience in the matter are aware how great is the difference in the qualities of plate-glass. Some kinds will keep clean six times as long as others under precisely the same circumstances. The qualities of sheet-glass also differ considerably, but it is much more easy to select good glass of this kind. See GLASS.

Painting and Papering.—The painting or papering of plastered walls should not be attempted till they are thoroughly dry. Paint greatly helps to preserve external wood-work, and it is equally necessary to frequently renew the painting of light railings or balcony panels, if they are made of malleable iron. Inside work, such as doors, shutters, architraves, window-breasts, and walls (if not papered), should get at least four coats of oil-paint. Frequently these finishings receive three coats of varnish instead of paint, if it is desired to show the grain of the wood. It is often the case that a first coat of glue-size is substituted for one of varnish, which makes an inferior job.

Building Materials.—Building stone, brick, terracotta, slate, and cement are noticed under their respective heads. In the better class of houses the roof-timbers, joists, window-frames, and other external wood-work are made of what is known in commerce as Baltic redwood, which is imported from Danzig, Riga, St Petersburg, and other places on the Baltic. It is the product of the Scotch fir (*Pinus sylvestris*). This wood when grown in Great Britain is not so valuable for building purposes as the imported timber. It is a moderately heavy, resinous, durable, and easily worked wood (see PINE). For room-doors, shutters, dados, and other internal work, the wood of the American yellow pine (*Pinus mitis*) is very generally used. It is an excellent timber for these purposes. Californian redwood (*Sequoia sempervirens*) is now, to some extent, used in Great Britain for the same kind of work as yellow pine. The pitch pine (*Pinus rigida*) of the United States yields a very resinous wood with a showy grain, which has also been occasionally employed for the joiner-work of houses in England.

An inferior wood, imported from Danzig, called whitewood, and said to be obtained from a species of spruce, has of late years been largely used for joists and roofing, owing to the comparatively high price of Baltic redwood. This whitewood is also, to some extent, employed for the internal finishings of rooms. Oak, mahogany, and other hard woods are only in request for parts of exceptionally important and costly buildings.

Machine-work.—Machinery is now extensively employed for sawing and cutting ordinary limestone and sandstone, as well as granite and marble (see article STONE). The sawing, planing, moulding, mortising, tenoning, dovetailing, and turning of wood is likewise executed on a large scale by machine tools. Sash and door clamping machines are also in use, so that in the workshops of many large builders hand-work in the construction of such articles as doors and window-sashes and frames is confined to smoothing the machine finish and glueing together their different parts. Wood-cutting for builder's purposes by machinery has made greater progress in the United States than elsewhere.

Building Leases. Under a variety of statutes in England and Scotland, the crown, represented by the Commissioners of Woods and Forests, heirs of entail under strict settlement, the Ecclesiastical Commissioners, the great university corporations, mortgagees in England, are authorised to grant building leases for ninety-nine years. The term of ninety-nine years has thus come to be associated with building leases, but such leases are granted for various periods. In England it has been decided that municipal corporations cannot at common law grant building leases for more than seventy-five years. In the case of the Montgomery Act, passed for Scotland in 1770, very stringent conditions were laid down as to the number of houses and the extent of ground, but these have been practically superseded by later legislation. It is much questioned whether the building lease is a convenient and economical tenure in towns. In the United States, building leases include repairing leases, and may continue for any term of years agreed upon by the parties, no time being specified by State or United States law. See GROUND-RENT, LEASE, and LEASEHOLD.

Building Societies are societies established for the purpose of raising, by periodical subscriptions, a fund to assist members in obtaining heritable property, freehold or otherwise. In the United Kingdom, they were formerly regulated by an act passed in 1836. After an elaborate inquiry by Royal Commission, with which the name of Sir Stafford Northcote (Lord Idlesleigh) is connected, a new act was passed in 1874 (the Building Societies Act, 1874), and was amended in 1876 and 1877. Regulations are issued from time to time by the Home Secretary, as in 1876 and 1882, and the Court of Session has framed an act of sederunt regulating the liquidation proceedings of Scottish societies in the Sheriff Court. All societies established after 1874 must be governed by these later acts, and those which were in existence in 1874, called 'old societies,' may adopt them, but it is not compulsory upon them to do so. The Act of 1836 declares that it shall be lawful to establish such societies, for the purpose of enabling the members to erect and purchase dwelling-houses, or acquire other real or leasehold estate, which shall be mortgaged to the society until the amount or value of the shares drawn on shall be fully repaid with interest and all other appropriate payments. A share is not to exceed in value £150, and the corresponding monthly subscription is not to be more than twenty shillings. A majority of the

members may make rules and regulations for the government and guidance of the society, such rules not being repugnant to the provisions of the act or to the general laws of the realm; and for offences against these rules and regulations, fines, penalties, and forfeitures may be inflicted. No member shall be allowed to receive any interest or dividend on his share until the same has been realised, except on the withdrawal of such member according to the rules of the society.

The Act of 1874 considerably enlarges the scope and powers of building societies. Section 13 declares that any number of persons may establish a society, either terminating or permanent, for the purpose of raising, by the subscriptions of the members, a stock or fund for making advances to members out of the funds of the society, upon security of freehold, copyhold, or leasehold estate, by way of mortgage; and any society under the act shall, so far as is necessary for the said purpose, have power to hold land, with the right of foreclosure, and may from time to time raise funds by the issue of shares of one or more denominations, either paid up in full or to be paid by periodical or other subscriptions, and with or without accumulating interest, and may repay such funds when no longer required for the purposes of the society. It will be seen that the restrictions of £150 and twenty shillings have disappeared, the contributions and ultimate value of a member's interest being at his own discretion. The liability of members, in respect of shares upon which no advance has been made, is limited to the amount actually paid or in arrear thereon; and in respect of shares upon which advances have been made, is limited to the amount payable under any mortgage or other security, or under the rules. Societies are empowered to receive deposits or loans, from members or other persons, corporate bodies, joint-stock companies, or terminating building societies, provided, in the case of permanent societies, that the total amount owing at one time shall not exceed two-thirds of the amount for the time being secured to a society by mortgages from its members; and in the case of terminating societies, shall not exceed two-thirds as aforesaid, or a sum not exceeding twelve months' subscriptions on the shares for the time being in force. Societies established under or adopting the Act of 1874 are bodies corporate, having perpetual succession and a common seal, thus dispensing with the cumbrous and inconvenient system of trusteeship. Their rules must specify the society's name and place of meeting; mode of raising funds, with their purposes and mode of investment; terms of withdrawal and repayment; manner of alteration of rules; the appointment, remuneration, and removal of officers; provisions as to general and special meetings, and the settlement of disputes, custody of seal, mortgage deeds, and securities, powers of directors and other officers, fines, and mode of dissolution. Societies may unite with others, or one society may transfer its engagements to another. They may purchase, build, hire, or take on lease any building for conducting their business. Minors may be members, but cannot vote or hold office during nonage. Accounts are to be furnished to members and loan depositors annually. The societies are exempt from stamp-duties of every kind, except those upon mortgages; while those which continue under the Act of 1836 retain their former exemption from stamp-duty upon mortgages up to £500. It is not probable that this difference will be permitted to continue long; and even now the slight gain is more than counterbalanced by the privileges of incorporation, &c. conceded by the Act of 1874. Receipts indorsed upon mortgages are sufficient discharges without reconveyance.

Two great divisions of building societies exist,

the terminating and the permanent, but the latter are rapidly superseding the former. In the best-conducted societies, subscriptions are received at any time and to any amount, at the option of the member. The majority of members pay from ten to twenty shillings per month, and others pay smaller or much larger sums as convenient. Very large sums are received in some societies. The National Permanent of London receives £783,000 in the financial year from 11,393 members, and the Bradford Third Equitable receives £596,000 from 8148 members. Other large towns in the provinces are not far behind, and in London the societies are numerous, and in the main prosperous. The Royal Commissioners, in 1872, assumed that building societies had a subscribed capital of over £9,000,000, a loan or deposit capital of over £6,000,000, over £17,000,000 total assets (of which £16,000,000 was advanced on mortgage), and an income of over £11,000,000. In 1885 the number of societies in England and Wales was 2644, with a subscribed capital of £32,235,452, a loan or deposit capital of £15,655,162, assets amounting to £49,472,827, and total receipts in that year of £21,093,977. These figures are below the mark, as 200 societies made no return. The total membership is probably above 600,000. In Scotland there are only 50 incorporated societies on the register, with a subscribed capital of £696,803, a loan capital of £278,120, assets amounting to about £1,000,000. There are also 153 unincorporated societies. The largest Scottish societies are the Paisley Heritable and the Bon Accord of Aberdeen. In Ireland there are 40 societies, with a subscribed capital of £672,585, loan capital of £416,065, assets amounting to £1,108,000. Much the largest of these is the Irish Civil Service of Dublin, with annual receipts of £330,801, but there are also thriving societies in Belfast, Derry, Cork, and elsewhere.

The theory of these institutions is very simple. Money is collected in comparatively small sums from large numbers of people, and lent to others who borrow upon real security, either to build or trade, or for any other purpose. There was a time when members were only permitted to subscribe fixed sums at stated times, and every departure from rule was visited by heavy fines. Now, in the best-conducted societies at least, every facility is given for varying powers of investment to find a place for capital; and entrance and withdrawal are equally easy. In most cases, the repayments are upon a scale calculated to pay off both principal and interest in a certain number of years, usually about fourteen, but advances on private mortgage or repayable at the borrower's convenience are becoming more frequent every year. In fact, the almost limitless adaptability of the building society system has only been appreciated of late years, and every decade sees changes and improvements in it. Under the new legislation the societies may look forward to a still more prosperous future. Unfortunately the bad draughtsmanship of the acts has led to much litigation. The practical points raised have been chiefly as to the right of withdrawal on one month's notice by 'unadvanced' members—i.e. members to whom no advance has been made; the liability of borrowing members, who share in profits, also to share in losses; the rights attaching to 'matured' shares—i.e. fully paid up; the jurisdiction of courts of law, whether effectually excluded by the arbitration clause in the rules. The Starr-Bowkett Society is one form of the terminable building society. In the original Bowkett Society the subscriber lends the society a small sum annually for a very long time, say 31 years, and the society lends him a large sum for a short time, nominally without interest. In the Starr form, after a member has repaid money lent to him on

property, he has to pay an increased subscription, so as to make the society terminate sooner. The advantage of these societies depends on whether the member gets his loan early or late.

In the United States, especially in and near Philadelphia, the number of building associations, as they are usually called, is very great, there being many thousands in all. The usual periodical instalment paid for shares of stock is one dollar per share each month. The funds are lent to borrowing members, a premium for the privilege being paid by such members in addition to interest. Small fines for non-payment of dues are sometimes exacted. Experience shows that in well-managed associations, the returns for money paid in is considerably in excess of simple interest.

See the four reports of Royal Commission on Building Societies from 1871 to 1874, with the local reports of assistant-commissioners; annual reports of the Registrar of Friendly Societies, *Monthly Gazette of the Building Societies*, and works by Davis, Wrigley, Scratchley and Brabrooke, Starr, &c.

Building Stone. No artificial building material such as brick, terra-cotta, or cement can give dignity and beauty to an edifice in anything like the same degree as an ordinary limestone or sandstone which can be cut by a chisel. Much less can burnt clay or artificial stone, no matter how much it is enriched by ornament and colour, approach marble, granite, or porphyry, in giving a noble character to an architectural monument.

By far the most common kinds of building stone are sandstones and limestones. The term freestone is applied indifferently to such examples of both kinds as dress freely with masons' tools. Both are bedded on sedimentary rocks, and both as a rule, when cut up into blocks for building, should be laid on their natural beds. In the northern part of Great Britain the name whinstone is always given by workmen to such igneous rocks as Basalt and Diabase (q.v.); but this name is also applied by them to a sandstone, for example, which has been locally much hardened, as well as to a metamorphosed sedimentary rock such as graywacke.

Sandstone.—Rock of this kind suitable for building is found plentifully in some parts of England, but principally in the central and northern counties, though it also occurs in Devonshire and Monmouthshire. Among numerous quarries it will suffice to name Darley Dale and Bakewell Edge in Derbyshire, Longridge Fell in Lancashire, Viney Hill in Gloucestershire, Bidston Hill in Cheshire, Addlingly in Yorkshire, and Hadley in Worcestershire. There are several well-known quarries about Newcastle-on-Tyne, and sandstone of a pleasing red colour occurs at Penrith and other places in Cumberland. These English sandstones are obtained from the Devonian, the Carboniferous, the Permian, and the New Red Sandstone formations. It is from the 'millstone grit' division of the Carboniferous that the stone for many of the public buildings in Manchester, Bradford, and Leeds was obtained. So far as can be judged from the appearance of comparatively modern edifices, the stone stands the smoky atmosphere of these towns very well. Ancient buildings in England, however, do not on the whole show that any sandstone used in them resists decay for centuries. Durham and Chester cathedrals and numerous small churches furnish examples of this.

All the towns of any size in Scotland, except Aberdeen and one or two small places, such as Dalbeattie in Galloway, are built of sandstone. So are almost all the ancient buildings of any note. The stone is chiefly obtained from the Carboniferous and Old Red Sandstone formations, but the

Permian rocks of Cumberland being prolonged into the county of Dumfries, some fine red sandstone is got there from that formation. In Scotland, accordingly, there is ample means of judging of the durability of this building material, which is on the whole so suitable for architectural purposes. It is vexatious in the extreme to have to say that much of the beautiful carved work at Kirkwall, Holyrood, Melrose, Kelso, and Jedburgh is quite wasted by decay. The age of the oldest of these abbeys is but little more than 700 years. Many modern buildings likewise show that, even when believed to be carefully selected, this material is often not durable.

So far as is known, the sandstone from Craigleith Quarry, near Edinburgh, resists atmospheric agencies better than any other in Scotland, or perhaps in the British Islands. A great part of the New Town of Edinburgh has been built of it. More recently, Binny Quarry in Linlithgowshire, the stone from which stands next in quality to Craigleith, has supplied the material for the principal buildings erected in the Scottish metropolis, and to some extent also for buildings in Glasgow; but for some years, owing to the unfavourable state of the quarry, it has yielded only a trifling supply. The cost of working Craigleith is double that of any other Scottish sandstone that would do for a fine building, and consequently no architect has for many years ventured to use it. Binny stone can only be got with difficulty. There are, however, plenty more quarries all through the length and breadth of Scotland, except in the north-west. Strange to say, not one of them, especially in the central part of the country, can furnish a stone upon which an architect can rely as being certainly durable. Yet so strong is the desire to have ornament for merely present appearance, that large quantities of building stones are now being brought from great distances both to Glasgow and Edinburgh, simply because they are of fairly uniform colour and can be cheaply worked.

Sandstones, being composed of grains of quartz, are highly siliceous. Darley Dale contains 96 per cent., Craigleith 97 per cent., and Binny 92 per cent. of silica. Some, however, have not more than 80 per cent. of this substance. The other substances they contain are chiefly carbonate of lime, alumina, and oxide of iron. It is hardly possible to tell a good sandstone merely by chemical analysis. A hard non-porous stone is, of course, more likely to be lasting than one which is soft and porous. There are a number of ancient buildings on or near the banks of the Rhine, between Basel and Cologne, which show the durability of a sandstone in a northern climate better than any in Great Britain. In these it is of a hard nature. See SANDSTONE.

Limestone.—Marble and chalk are the purest limestones, but it will be convenient to notice first those more or less composite limestones which are sufficiently hard and strong for building, yet not highly crystalline like marble. One of the best-known kinds of English building stone is the dolomite, or magnesian limestone of the Permian formation, which ranges from Nottingham to Tyne-mouth. It is a double carbonate of lime and magnesia, containing a varying proportion of silica. At Mansfield in Nottinghamshire, the amount of silica is exceptionally high—viz. 50 per cent., while at Bolsover and Mansfield Woodhouse it is only 4 per cent. The Houses of Parliament are built of this dolomite, which unfortunately decays rapidly under the influence of the London atmosphere. Among ancient buildings, some parts of York Minster show its perishable nature. Yet in Conisborough Castle, built in the 12th century,

and in some country churches nearly as old, it has stood the effects of time very well.

The limestone of the oolitic formation, which extends from Dorsetshire into Yorkshire, is obtained for building purposes, for which it is extensively used, at several well-known quarries, such as those of the Isle of Portland, Bath, and Leekhampton Hill in Gloucestershire, Barnac in Northamptonshire, and Ancaster in Lincolnshire. The Bath stone contains 95 per cent. of carbonate of lime; and the Portland stone, which, though belonging to the same formation, is not of oolitic structure, contains the same percentage of that carbonate. The former has besides $2\frac{1}{2}$ per cent. of carbonate of magnesia; the latter 1·2 per cent. of this substance, and the same amount of silica. Small quantities of alumina, iron, and water are present in both. Much of the oolitic limestone is easily cut with a saw when newly quarried, but it hardens on exposure, and is fairly durable. Like the dolomite above mentioned, it is very suitable for enriched as well as plain work, and is of a pleasing colour. Some ancient structures built of the oolitic limestone of their own neighbourhood are in a good state of preservation. Among these are Lincoln Cathedral, some churches at Oxford, and Wells Cathedral. There are others, however, which have not so well resisted decay. St Paul's Cathedral, London, is built of Portland stone. Kentish rag is an impure limestone, compact, heavy, non-absorptive, and difficult to dress. It is used in London chiefly for rubble work, and is very durable.

There are extensive deposits of limestone in England, Scotland, and Ireland, which are only fit for burning into lime, or at least are not suitable for the hewn work of buildings.

The fine limestone from Caen in Normandy is much used for internal architectural work in England, and to some extent even in America. It is a fine-grained, easily chiselled, beautiful material, of a creamy-yellow uniform colour. But in external work it is very liable to decay, especially in towns. In the middle ages it was employed for some cathedrals—that of Canterbury, for example—as well as for smaller churches in the south of England. Travertine is a peculiar kind of limestone believed to be formed by precipitation from water containing lime. It is somewhat cellular in structure, of a buff colour, and very durable in Italy, where, in Rome especially, it has been extensively employed for both ancient and modern buildings, among others the Colosseum and St Peter's. Nummulitic limestone is chiefly composed of beautiful fossils like coins or buttons of filigree work. Some of the Egyptian pyramids are built of this stone. See NUMMULITE.

Marble.—In the British Islands marble is only used for the decorative parts of buildings. White marble is found in Skye, Sutherland, and one or two other places in Scotland. It also occurs in a few localities in Ireland; but it is doubtful whether it would be profitable to work it in either country. Coloured marbles, some of which are handsome, are regularly quarried in Devonshire, and also in Derbyshire, where they contain shells, ennerites, and other fossils, which give them an attractive appearance when polished. Ireland is comparatively rich in coloured marbles. The wavy and mottled green serpentine marble of Connemara is a very beautiful stone. Black marble is worked in Kilkenny and other counties, and a veined red marble in Cork. Italian and other foreign marbles are, however, more used in the United Kingdom than the native kinds. See MARBLE.

Serpentine.—This has a general resemblance to coloured marble, but it is of quite different com-

position, being a silicate of magnesia. Cornish serpentine is perhaps the most beautiful ornamental stone in the British Islands. It is principally used for internal decoration. Serpentine is found in Banffshire and in Shetland, but only pieces of limited size can be got. See SERPENTINE.

Granite.—In the granite districts of Great Britain, the stone is used for ordinary building purposes. Aberdeen, for example, is almost wholly built of this material. It is usually only hammer-dressed, but even with the rough face so imparted, it gives a building a good appearance. For decorative purposes it is polished. Peterhead and Ross of Mull are red granites, while the Aberdeen, Dalbeattie, and Creetown varieties are gray or bluish gray. Peterhead granite especially is a good deal used in London and other large towns in the British Islands for some of the more prominent features of buildings, and is also sent to America. The Cornish granites have been much employed for bridges over the Thames, and for docks and breakwaters. There are some good granites in Ireland. See GRANITE, and SYENITE.

United States.—Many excellent building stones are found in America. The quarries of Maine have been the chief source of the supply of granites; and of those from this state the Calais variety is red, and that from Spruce Head gray, both of these taking a fine polish. The granite from Hallowell, also in Maine, is remarkable, as its dressed surfaces are nearly as white as marble. New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, and several other states contain granite. Sandstones constitute the most valuable group of building stones in the United States, as they have a wide distribution, have much diversity of tint and texture, and can be comparatively cheaply obtained. They are principally of triassic and carboniferous age. White marble has been quarried on a considerable scale for important public buildings. That from Lee, Massachusetts, which is strong and durable, was used in the construction of the Capitol at Washington, and for the city hall at Philadelphia. From Stockbridge, in the same state, the marble was got for the state-house at Boston and the city hall of New York. Tuckahoe marble, which is pure white, strong, and coarse-grained, has been employed for some of the finest buildings in New York. For St Patrick's Cathedral a pure white dolomite called 'snowflake marble,' from Pleasantville, New York, has been chiefly used. Rutland county, Vermont, is the great centre of the marble industry for purely decorative purposes. Numerous beautiful coloured marbles have been discovered in the United States during the last thirty years.

Buitenzorg, capital of a sub-residency in Java, 35 miles S. of Batavia by rail, stands in mountainous country, 880 feet above the sea, and has so fine a climate that it is becoming more and more a favourite summer resort of the Batavian merchants. The splendid country palace of the governor-general is here, and around it an extensive and famous botanic garden.

Bujalan'cé, a city of Andalusia, Spain, 25 miles E. of Cordova. It has an old Moorish castle, and manufactures of leather and woollen cloth. Pop. 9974.

Bukkum Wood. See BRAZIL-WOOD, and SAPAN-WOOD.

Bukkur, a fortified island of the Indus, in Sind, between the towns of Rohri and Sukkur. Composed of limestone, it is 800 yards long and 300 broad, and rises 35 feet above the stream. The great Lansdowne cantilever railway bridge (1886-89) across the Indus here, which is 1200 feet long, takes advantage of the island.

Bukowina ('beech-land'), a province in the extreme east of the Austro-Hungarian empire, surrounded by Galicia, Russia, Moldavia, and Hungary. Area, 4035 sq. m.; pop. (1869) 513,404; (1890) 646,591, of whom 42 per cent. are Ruthenians, 32 Moldavians, and 13 Jews, while 70 per cent. belong to the Greek Church. It is traversed by offsets of the Carpathians, culminating at 6077 feet: gives rise to many rivers flowing towards the Black Sea; and abounds in wood, along with considerable mineral riches. Large numbers of cattle are reared, and also excellent horses. The Bukowina, according to many Austrian historians, was wrested from Transylvania in 1482 by Moldavia; but it had long before formed an integral portion of the latter state, whose fortunes it shared till, in 1775, it was ceded by the Turks to Austria. For a time it was united to Galicia, but in 1849 was made a separate 'crown-land,' or province, and is officially still a duchy. Czernowitz is the capital.

Bulacan, a town of Luzon, Philippines, at the head of the bay of Manila, and 20 miles NW. of the city of that name. Pop. 13,000.

Bulak. See BOULAK.

Bulandshahr, a British district in the Meerut division, North-west Provinces of India, with an area of 1915 sq. m., lying between the Jumna and the Ganges. It forms a part of the Doab, and presents the aspect of a monotonous cultivated plain, with an average elevation of 650 feet above sea-level. The Ganges Canal passes through the district from north to south, and artificial irrigation has made many unpromising districts fruitful. More than one-fourth of the cultivated area is so supplied. Cereals, safflower, indigo, cotton, and wool are exported. The East India Railway passes through Bulandshahr, the Oudh and Rohilkhand Railway crosses its south-east corner. There are twelve towns with a population of over 5000, of which the most important are: Khurja (27,190), Sikandarabad (16,479), and Bulandshahr or Baran. This last, the administrative headquarters, is a place of great antiquity, coins of Alexander the Great being still found here. Pop. of town, 18,500.

Bulb. Our perennial herbs which die down during the winter have always accumulated during the summer some store of reserve material (starch and nitrogenous matters) which serves as capital upon which to draw for their new and rapid start

in spring. This subterranean store may be deposited in roots (e.g. orchis), in an underground creeping stem (e.g. rhizome of iris or primrose), in definite portions of rhizome which are then called tubers (e.g. potato, Jerusalem artichoke), or in the lower portion of the main axis (corm of crocus), which thus assumes a bulbous form (see ROOT, RHIZOME, TUBER, CORM). The term bulb is, however, restricted by botanists to those cases in which the store is deposited in the

foliage leaf (fig. 1). The first leaf of the following year's growth is not swollen, but almost completely insheathes the developing flower axis, the first foliage leaf of which again thickens as the bulb, and develops in its axil the bud of next year. From such a simple form transitions in all directions are easy: thus if we increase the number of leaves, and unite without greatly thickening their sheathing bases, we have the incipient bulb of the leek. Here the store is deposited along an indefinite extent of leaf-base, which the gardener accordingly artificially extends by hoeing up earth around the plant, and so arresting vegetation in the blanched portion, and giving us the succulent parenchymatous esculent which is so familiar in cookery. In the onion or hyacinth, however, the area of storage becomes clearly marked off, and in autumn the vegetative portion of the leaf dies away, leaving the successive leaf-bases overlapping each other around the

Fig. 2.

excessively shortened disc-like axis. This is the so-called tunicated bulb (fig. 2).

In almost all forms of this, one or more of the lowermost leaves of the axis cease to appear above ground; and in some cases (e.g. *Lilium candidum*) where the bulb is made up of more than one year's growth, it is composed of first the thickened leaf-bases of a previous year; next the short, thick, scaly leaves of the lower portion of the axis; and within this the swollen leaf-bases of the upper portion (fig. 2, c). This leads to the ease presented by other lilies (e.g. *L. martagon* and *bulbiferum*) in which the foliage leaves are restricted to the upper portion of the axis, and the leaves of successive years forming the bulb are all subterranean and reduced to swollen overlapping scales. This is the so-called scaly bulb.

In some cases many new daughter-bulbs may develop in the axils of the leaves composing the parent bulb; such are the so-called cloves of garlic (*Allium sativum*). Tunicated bulbs are hence sometimes propagated by cutting across transversely; a series of axillary buds is thus compelled to arise. In *Lilium bulbiferum* the same principle appears, and in its simplest form; for the buds in the axils of the foliage leaves are developed as small bulbs (bulbils), and these readily fall off and take root. In other species (*A. Schanoprasum*, *A. fallax*), we find incipient cases of bud formation along a rhizome; and this becomes strongly marked in the common *Saxifraga granulata*, of which the crowded bulbs are not unfrequently mistaken for mere tuberous swellings along the roots, until dissection proves that we have to do with the bulbous buds of spreading rhizomes.

Fig. 1.—Bulb of *Allium ursinum*:

the leaf-bases, or in modifications of entire leaves. The incipient bulb is best seen in the common wood-garlic (*Allium ursinum*), in which the store is deposited in the swollen spindle-shaped base of a

The use of the bulb to the plant, as affording at once a citadel of refuge during the severity of the winter of cold climates, or of the dry season of warmer ones, and a store of materials for a vigorous start in spring before the competition of other plants has become active, will be sufficiently obvious; and the importance of bulbous plants in such peculiar climates as that of Siberia or of the Cape of Good Hope is thus readily accounted for. The large nutritive store gives a proportional possibility of reproductive outlay, and the remarkable size and beauty as well as the earliness of flowering of most bulbous plants is thus explained. For all these reasons, as well as the ease of their cultivation, preservation, and transport, they have always been greatly valued by the florist; their nutritive store in some cases makes them valuable and savoury articles of food; while others—such as that of Squills (*Scilla*, q.v.)—contain also products of vegetable waste, which have turned out to be of medicinal importance.

Bulbul, a Turkish name (used also in Persian) for the nightingale, which has found its way into English poetry through Moore's and Byron's patronage. But the same name is given in India to a very different bird, *Pycnonotus linnorhous*, usually ranked among the babbling thrushes (Timeline). It is a little bird of brilliant plumage, and the male has a crest or tuft on its head. It is remarkable for its pugnacity: the Singhalese consider it the most *game* of all birds. Its powers of song have also earned for it the name of 'Ceylon nightingale.' The name bulbul is also applied to related forms like the Bristle-necked Bulbuls (*Criniger*) in Western Africa, India, &c., and the Red-whiskered Bulbul (*Otocorys jocosus*) of India and Burma.

Bulgaria, a principality in the Balkan Peninsula (q.v.), lying between the Danube and the Balkans, was created by the Treaty of Berlin, 13th July 1878. The area of Bulgaria is 24,699 sq. m.; that of Eastern Roumelia, 13,861—together nearly equal to two-thirds of the area of England (without Wales). The north of Bulgaria is fertile plain and hilly country; the south is wooded and mountainous. A fine waterway as her northern boundary and an outlet to the Black Sea, a seaboard, a mild climate, a purely agricultural country capable of great development and of maintaining five times the present population, free institutions and about the most liberal constitution in Europe, a peasantry possessing the solid qualities and persevering industry of northern races—with these elements for her economic development her right to a national existence cannot be disputed.

In 1893 the population of Bulgaria and Eastern Roumelia together was 3,309,816—76 per cent. Greek-Orthodox, 21 Mohammedan, 0.59 Roman Catholic, and 0.77 Jewish. Since 1850, zealous efforts by American missionaries have forwarded education, but made few converts. The 'Robert College' at Constantinople has educated many Bulgarians in English and American political ideas. Grouped according to language, 67 per cent. were Bulgarians, 26.26 per cent. Turks, 2.44 per cent. Wallachians, 1.87 per cent. Tsigans (Gypsies), and the remainder chiefly Greeks, Jews, and Tartars. Sofia (q.v.) is the capital; the other principal towns being Varna, Shumla, Rustekuk, Widin, Razgrad, Sistova, Tirnova, and Plevna. The populations in the towns have greatly diminished since the Russo-Turkish war, owing to the emigration of the Mussulmans (chiefly to Asia Minor) in order to avoid military service; and the same may be said of Eastern Roumelia. It has been stated that 200,000 Mussulmans have thus emigrated from Bulgaria alone. Farther westwards the emigration has been more pronounced. For example, Widin, which

before the war had 30,000 inhabitants, in 1881 had only 13,714. Their departure has been a gain to the native populations, for their lands have been sold at a nominal price to the peasantry, and the commercial traffic (chiefly with Austria) has nearly doubled in value.

EASTERN ROUMELIA—now incorporated with Bulgaria—is, in many respects, in advance of the sister-country; it has much longer been open to European influences, connected as it is with Constantinople and the south by the valley of the Maritza. Eastern Roumelia obtained administrative autonomy by the Treaty of Berlin.

The physical aspects of the country are very varied, the surface in the west being broken up by the offshoots of the Albanian ranges, and in the north and north-east by the Balkans and their spurs. According to the latest statistical returns, 1,663,000 acres of land were under tillage. The principal exports are cereals, and the imports live-stock; but there are important woollen manufactures, and the growth of the vine and tobacco receives considerable attention. One of the most thriving branches of native industry is the production of attar of roses; in the sheltered villages south of the Balkans its value in one year may reach £500,000. The silk industry was revived in 1890-95. The census of 1885 gave the total population of the province at 975,030, composed of the following: Christian Bulgarians, 681,734; Turks and Moslem Bulgarians, 200,498; Greeks, 53,028; Gypsies, 27,190; Jews, 6982; Armenians, 1865; foreigners, 3733. These figures show the preponderating numbers of the Bulgarians. Philippopolis (q.v.) is the capital.

In the first two years of the autonomy, the nationalities, as might have been expected, were in constant conflict, but the Bulgarians had no difficulty in obtaining the upper hand. Both parties of the government equally desired the union of the two Bulgarias; but it was the Unionists (Nationalists) who, in the summer of 1884, organised the petition for incorporation with the principality.

The Bulgarians in general are of smaller stature than their neighbours, the Servians; but they are powerfully built, and carry a firm head on their shoulders. The physique is distinctly different from that of pure Slavs; the features show some traces of the original. Without possessing the vivacity of the Roumanian, or the *esprit* of the Servian, the Bulgarian has no less a share of intelligence. The typical Bulgarian is a peaceful peasant, laborious and sensible, a good husband and a good father, loving the comforts of home, and practising the domestic virtues. Education has been very zealously and steadily promoted. There were only a few private schools in 1878; in 1881 there were 1760 teachers, in 1892 upwards of 5000.

The Bulgarians extend far beyond the boundaries of the two Bulgarian states. In a great part of Macedonia they constitute the bulk of the people; in Bessarabia they are numerous; and in the Banat they number some 26,000, all Catholics. The Bulgarian authorities state the total number of Bulgarians at six or even seven millions; most others compute them to amount to about five millions. They are very numerous in Constantinople.

Bulgaria possesses one of the freest and most democratic constitutions in Europe, which, like that of Eastern Roumelia, seems to be modelled on the lines of the Belgian constitution, except that there is no second chamber, and election of the *Sobranje* or National Assembly is by universal suffrage. The monarchy is 'hereditary,' and under the sovereignty of the Porte. Military service is obligatory. The army of Bulgaria (with Eastern Roumelia) contained in 1894 about 36,000 men on a

peace footing, while the war strength is 100,000. The fleet comprises 4 ships of war and 10 armed gun-sloops. The budget of 1894 showed a revenue of a little over £4,000,000, which was considerably exceeded by the expenditure (largely for public works).

History.—The country now known as Bulgaria was originally inhabited by Thracians, and under the Romans formed the province of *Moesia*. Wasted by Goths and Huns, it was afterwards overrun and occupied by the Slavonic Slovenians. The Bulgars were originally an Ural-Altaic people. Coming from the banks of the Volga (where *Bolgary* was their capital), they first crossed the Danube in the 6th century, and occupied the eastern portion of the peninsula. Though probably fewer in number, they rapidly subjected their Slav predecessors, adopted their language and customs, and, at once absorbing and being absorbed, became a great Slav power. In 864 their prince, Boris, was baptised, and the Bulgarians became dependent on the patriarchate of Constantinople. During the 9th and 10th centuries the Bulgarians were victorious in their wars against the Magyars in the north and the Greeks in the south, and had reached the height of their power. Their prince, Simeon, assumed the title of 'Autocrat or Czar of all the Bulgarians and of the Greeks.' They dominated the greater part of the peninsula, including Macedonia, Thessaly, Epirus, and Albania. The Bulgarian archbishop was made an independent patriarch, and the Serbs and even the Byzantines paid Simeon tribute. It is interesting to note in reference to the Bulgarian ascendancy that, already in 976, their czar, Shishman, whose power ranged over the whole peninsula, conceived the idea of a state founded on the unity of race, and caused himself to be styled 'Emperor of the Slavs.' In 963 the western part of Bulgaria broke loose from the eastern to form a new kingdom, and so weakened the Bulgarians in their constant rivalry with the Byzantine emperors. The bloody wars continued; in the end of the 10th century part of Eastern Bulgaria was incorporated with the Byzantine empire, and in 1018 the western Bulgarian kingdom became a Byzantine province. A third Bulgarian kingdom was formed in 1186 by a successful rebellion, and maintained itself against the emperors of Constantinople until the arrival of the Osmanli Turks. The Greeks, who feared and hated them, attributed such shameful vices to their persistent enemies, that the name of Bulgarian came in most European tongues to be the most odious of epithets. (For the Bogomili puritanism of the 12th century, see BOGOMILI.) In 1356 Bulgaria and her ally, Serbia, pressed to the walls of Constantinople, and only failed in the establishment of a great Slav state by reason of the defectiveness of their administrative organisation. The Servians finally succumbed at the decisive battle of Kossovo in 1389, and Tirnova, the Bulgarian capital, was taken four years later by the son of Bajazet. From that time the Ottoman power commenced to dominate. Bulgaria, under the influence of Byzantium and of Christianity, had attained in the middle ages a degree of civilisation equal to that of western nations; but the invasions, first of the Tartars, and subsequently of the Osmanli, entirely destroyed it, and the ancient warlike character of the race seemed to have been lost for ever, though rebellions took place from time to time. The first national awakening dates from the year 1762, when the monk Paisios, then at Mount Athos, wrote the national chronicles, and revived memories of ancient glory. A new national literature began; the first Bulgarian school was opened in 1835, and was followed by others. A newspaper appeared in

1844. The Crimean war stirred up Slavonic sympathies which Russia has sedulously and naturally cherished. In 1872 the Bulgarian Church and archbishop became again independent of the hated supremacy of the Greek patriarch.

During the troubles in Bosnia and Herzegovina in 1875, excitement in Bulgaria began, but two or three ill-organised local risings in 1876 were swiftly suppressed by Turkish troops. The unconcealed aspirations of the Christians provoked the suspicions and fears of the Moslems, and the Turkish inhabitants of Bulgaria rose against their unarmed Christian neighbours, assisted by the notorious *Bashi-Bazouks*, or irregular troops. In the provinces of Philippopolis and Tirnova fifty-eight villages had by June 1876 been destroyed, and twelve thousand men, women, and children cruelly slain. The 'Bulgarian atrocities' awakened horror throughout Europe, especially in England; and a conference at Constantinople proposed to the Porte the organisation of two autonomous provinces. The Porte refused to make concessions. Russia, in its assumed capacity as guardian of the Slav races of Turkey, declared war (1877). By the treaty of San Stefano, the victorious Russians (March 1878) proposed to constitute a Bulgarian state within the limits of the old kingdom, extending from the Danube across Macedonia to the Aegean. But the dissatisfaction of Austria and Britain with the proposed arrangement led to the Berlin Congress; and the Berlin treaty (13th July 1878) constituted an autonomous, though tributary, Bulgaria north of the Balkans, whilst to the mainly Bulgarian province south of them, that of Eastern Roumelia (q.v.), it granted administrative autonomy. The prince of Bulgaria, freely elected by the people, must be confirmed by the Porte with the assent of the Powers. The first choice of the Bulgarians was Prince Alexander of Battenberg, a cousin of the Grand-duke of Hesse, who in 1879 became Alexander I. of Bulgaria. In the autumn of 1885, the outbreak of a revolution in Eastern Roumelia, and Prince Alexander's acceptance of its union to Bulgaria, provoked the jealousy of Serbia; and on 14th November King Milan invaded Bulgaria, anticipating an easy march to Sofia. In the fourteen days' war which ensued, the Bulgarians suffered temporary defeat, till, by his gallantry and generalship at Slivnitsa, Prince Alexander turned the tide of fortune, and, driving the Servians back through the Dragoman Pass, entered Servian territory at the head of 50,000 men, and captured Pirot. In March 1886 peace was concluded between Serbia and Bulgaria; and Prince Alexander was ultimately recognised by the Porte as governor-general of Eastern Roumelia. The prince, originally regarded as too Russian in his sympathies, had become the centre of Bulgarian national aspirations, and the darling of the people. At the same time he fell more and more into disfavour with Russia and the czar. In the summer of 1886 he was kidnapped by Russian partisans and carried into Russia. Returning immediately, he received an enthusiastic reception; but owing to the hostility of Russia, he felt himself compelled to abdicate. A provisional government was formed, and firmly maintained the national cause in defiance of very strong Russian pressure. In the summer of 1887 Prince Ferdinand of Saxe-Coburg, against the will of the great Powers (especially of Russia), accepted an invitation by the regency to fill the vacant throne.

Language and Literature.—The original Bulgarian was of course an Ural-Altaic or Ugrian language, but it has left only a few traces in the Slavonic speech adopted by the Bulgarians who settled in the Balkan Peninsula. The old Bulgarian Slavonic tongue is closely allied to the

great Russian, but some Servian, Greek, Romanic, Albanian, and Turkish elements have found their way into the language. The literature in the old palmy days consisted chiefly of translations from the Greek, and theological works. The modern literature (since 1762) is chiefly educational and popular and political. The poems of Slaviikov, the novels of Karavelov, the historical works of Drinov, deserve mention; there is also a rich lyrical popular poetry. The Cyrillic alphabet is that ordinarily used, as in Russian—namely, that modified out of the Greek by Cyril (q.v.). See Dozov, *Chansons Bulgares* (1875); Rosen, *Bulgarische Volksdichtung* (1879); the grammar and dictionary (Bulgarian-English) by Morse and Vasilief (Constant. 1859-60); and for an article on the literature, the *Westminster Review* for 1878. On *Bulgaria*, see the history by Jirecek (Prague, 1875; German trans. 1876); the German work of Kanitz (2d ed. 1880); Barkley's *Bulgaria before the War* (1877); Minchin, *Bulgaria since the War* (1880); Samuelson, *Bulgaria, Past and Present* (1888); Diecy, *The Peasant State* (1894); Hnyshe, *The Liberation of Bulgaria* (1894).

Bulgarin, FADDEI VENEDIKTOVICH, Russian author and journalist, born in Minsk in 1789, served in the Russian army, but finding himself neglected, in 1810 joined Napoleon. In 1819 he returned to St Petersburg, where his writings soon attracted notice by their intense satire and intense servility. In 1825 he started the *Sévernaja Pchelá* ('Northern Bee'), a daily paper, which for long was alone permitted to discuss political questions. He was a privy-councillor at his death, 13th September 1859. A zealous supporter of reaction and of absolutism, he enjoyed, through relations with the secret police, an unlimited power, which he freely used to the detriment of opponents. He was a witty and versatile writer, and published travels, histories, novels, and statistical works, some of them of value. His *Memoirs* appeared in 6 vols. in 1846-50 (Ger. trans. Jena, 1858-61).

Bulkheads, in a ship, are the partitions between the several portions of the interior, whether to separate it into compartments to suit the exigencies of stowage or loading, or as a safeguard against foundering (see BUOYANCY). Bulkheads are either *transverse*—i.e. running athwart the vessel—or *longitudinal*—i.e. in the direction of the vessel's length, and are usually made watertight, thus dividing the interior of the vessel into three, four, or more compartments, each of which is self-contained, and watertight in reference to its neighbours. Should any one of the compartments, through damage to the skin of the vessel, be laid open to the sea, its self-contained character prevents the water penetrating the other compartments, thus lessening the risk of foundering, if not altogether preventing it. In very many of the modern high-class mail and passenger steamships, the hull is subdivided to such an extent that if any two compartments be simultaneously laid open to the sea, the vessel still retains sufficient floating power. To a very large extent this degree of subdivision has been attained through the encouragement held out to shipowners by the Admiralty, that for ships so divided there is the likelihood of employment in time of war. The great majority of merchant steamers, however, are not yet so perfectly subdivided, objections being taken to the system by shipowners on the score of expense, of extra weight of hull, and of the alleged inconvenience in the working of cargo. The Merchant Shipping Act of 1854 provided for the fitting of a certain number of bulkheads in steamers, but the growth in ship dimensions soon rendered this inelastic provision utterly useless, if not mis-

chievous, and it was repealed in 1862. Lloyd's Registry for the classification of ships has virtually assumed the functions which the government and the Board of Trade then discarded, and the rules of this society provide for a degree of subdivision in steamships, which is on the whole satisfactory.

In sailing-ships there is almost an entire absence of bulkheads, the only one considered necessary being that nearest the bow, the intention being to provide against damage to the bow through collision, hence this bulkhead is generally known as the 'collision' bulkhead. In numberless instances the collision bulkhead has saved the vessel which struck another 'bow on'; but the common case is for the iron ship which is struck to founder, if her broad-side is penetrated below water.

Since 1874-78 the practice of carrying water ballast (see BALLAST) in the bottom of merchant steamers, to secure the requisite stability when unloaded with cargo, has resulted in various types of double or cellular bottoms, which are of the greatest benefit in the event of damage to the vessel's outer skin. The presence of the inner and watertight bottom in such cases has not unfrequently been the salvation of the vessel after grounding on rocks.

In ironclads such as the *Achilles* and the *Devastation*, which have inner bottoms, there are compartments to the number of about 105, each of which is watertight as regards its neighbours. In the torpedo-ram *Polyphemus* and other recent vessels the subdivision principle has been carried out to even a more elaborate extent.

Bull. The word is derived from the Lat. *bullo*, 'a bubble of water,' and then 'a round ball of any kind.' In the middle ages it came to signify the capsule of the seal appended to letters from emperors or popes, next it was used for the seal itself, and lastly for the document to which the seal was appended. Its use is now commonly restricted to papal documents issued with certain indispensable formalities.

These formalities have varied greatly from age to age, and we must content ourselves with an account of the modern practice down to December 1878, and of the changes made at that date by the reigning pontiff Leo XIII. Down to that time, a bull had a seal, usually of lead, occasionally of gold, attached to it. On one side was the official name of the pope (e.g. Gregory XVI., Pius IX.), on the other the heads of Peter and Paul, separated by a cross and surmounted by the letters SPE (i.e. 'Sanctus Petrus') and SPA (i.e. 'Sanctus Paulus') respectively. The seal was fastened by red or yellow silk, or by uncoloured hemp, according to the nature of the contents. Bulls were written on strong parchment and in the Latin tongue. They began with the words 'N. episcopus servus servorum Dei dilecto filio (or dilectis filiis, &c.), salutem et apostolicam benedictionem.' Sometimes in cases where permanent decisions were given or privileges of great moment conferred, the words 'In perpetuum,' or 'In æternam rei memoriam,' were substituted for 'Salutem et apostolicam benedictionem.' Sometimes, also, when no special persons were addressed, 'In perpetuum,' &c., immediately follows the 'Servus servorum Dei.' Usually signatures are added below in testimony that the bull is authentic. Formerly it was common for the cardinals to sign; later on this was done by various members of the curia, specially by the protodatus, secretary of briefs, and vice-chancellor. The bull is dated according to the year of the incarnation, the year of the pontificate, and the day of the month after the old Roman reckoning. The character used from the reign of Adrian VI. to our own day is of that crabbled and indistinct kind known as 'litera S. Petri,' or in Italy as the 'carattere bollatico' or 'teutonico.' Finally,

the bull is expedited from the apostolic chancery in the Vatican.

By a *Motu proprio* of December 9, 1878, Leo XIII. ordained that the leaden seal in use for more than a thousand years should be employed henceforth only in case of bulls concerning collations, erections, and dismemberments of greater benefices (reserved to the pope), and other solemn acts of the holy see. In other bulls, 'especially those relating to ordinary benefices and marriage dispensations,' the old leaden seal is to be replaced by a red one stamped on the parchment itself, with the heads of St Peter and St Paul surrounded by the name of the reigning pope. The ordinary Latin current writing is henceforth to displace the Gothic character.

The divisions of bulls into different species—e.g. 'consistoriales,' issued after consultation in consistory; 'dimidiæ,' by a pope not yet crowned, &c.—possess little general interest. If we add to the words of Leo XIII., just quoted, bulls conveying doctrinal decisions, we have a correct idea of the objects for which bulls are published. It is a mistake to suppose that bulls are always, and of necessity, more important than briefs.

A *Bullarium* is a collection made without official authority of papal documents (not necessarily bulls in the strict sense) which have not found a place in the *Corpus Juris*. A bullarium may contain the acts of a particular pope, or may be limited to bulls relating to particular orders, churches, &c., or it may comprise bulls of all ages, and on all kinds of subjects, excluding only those already to be found in the *Corpus Juris*. The first bullarium appeared at Rome in 1586, edited by Cherubini. The most convenient is that published at Turin (24 vols. 1857-72).

Bull, a ludicrous blunder in speech implying some obvious absurdity or contradiction. The origin of the name is supposed to be due to the contrast in papal bulls between the assertion of excessive humility in the title, by which the pope styles himself 'servant of servants,' and his assumption of absolute supremacy and authority over the world. It is found with much the same sense as early as the 14th century in the *Cursor Mundi*. Bulls in their best form are usually alleged to be an especial prerogative of Irishmen—at least it is certain that the best examples have come from Ireland. Coleridge, remarking on the well-known bull, 'I was a fine child, but they changed me,' says: 'The bull consists in the bringing together two incompatible thoughts, with the sensation but without the sense of their connection,' Sydney Smith, whose authority is supreme in this region, says: 'A bull is an apparent congruity, and real incongruity of ideas, suddenly discovered.' It is 'the very reverse of wit; for as wit discovers real relations that are not apparent, bulls admit apparent relations that are not real.' See the *Essay on Irish Bulls* (1803) by Miss Edgeworth and her father.

Bull, GEORGE, D.D., divine, was born at Wells, Somersetshire, in 1634, and studied at Exeter College, Oxford, whence he retired in 1649, having refused to take the commonwealth oath. Ordained in 1655, he took the small parish of St George's, Bristol, and subsequently obtained the rectory of Siddington, Cirencester (1658), that of Avening, Stroud (1685), the archdeaconry of Llandaff (1686), and the bishopric of St Davids (1705). He died at Brecknock, 17th February 1710. His *Harmonia Apostolica* (1670), whose object was to reconcile the apostles Paul and James on the subject of justification, occasioned considerable controversy among divines, and, in answer, Bull published his *Examen Censuræ* and *Apologia pro Harmonia*. His greatest work, the *Defensio Fidei Nicenæ* (1685), was directed against

Arians and Socinians, Tritheists and Sabellians; for his *Judicium Ecclesiæ Catholicæ* (1694) the thanks of the whole French clergy were sent to him through the celebrated Bossuet. These are included in Dr Burton's edition of his works (8 vols. Oxford, 1827), to which is prefixed a Life by R. Nelson; and they are translated in the *Library of Anglo-Catholic Theology* (Oxford, 1842-55).

Bull, JOHN, a generic name for an Englishman as a personification of what is supposed to be the English type, from Arbuthnot's use of the name in his *History of John Bull* (1712; reprinted complete in Pope's 'Miscellanies' in 1728). The subject of that history is the 'Spanish Succession during the reigns of Queen Anne and Louis XIV.' Queen Anne is 'Mrs Bull'; 'John Bull's mother' is the Church of England; and 'John Bull's sister Peg' is the Scotch nation, represented as in love with Jack (*Calvin*). The description of Bull is so close to the familiar figure in the pages of *Punch* that a sentence or two must be quoted: 'Bull in the main was an honest plain-dealing fellow, choleric, bold, and of a very inconstant temper. He dreaded not old Lewis (Louis XIV.), either at back-sword, single falchion, or cudgel-play; but then he was very apt to quarrel with his best friends, especially if they pretended to govern him. If you flattered him, you might lead him as a child.'

Bull, JOHN, musician, born in Somersetshire about 1563, was appointed organist in the Queen's Chapel in 1591, first music lecturer at Gresham College in 1596, and organist to James I. in 1607. A Catholic, he fled beyond seas in 1613, and at Brussels entered the archduke's service; in 1617 he became organist of Antwerp Cathedral, and there he died, 12th March 1628. Little of his music has been printed. The claim advanced for him to the authorship of 'God save the King' (see NATIONAL HYMNS) is better founded than the impossible story of his adding, within a few hours, forty parts to a composition already written in forty parts; but from the extreme difficulty of his instrumental music, it would appear that his great reputation as an organist was deserved.

Bull, OLE BORNEMANN, a famous violinist, was born 5th February 1810, at Bergen, in Norway. His father's opposition only deepened his natural passion for music. In 1829 he went to study under Spohr at Cassel, but was so coldly received that he betook himself to Göttingen to study law. But music soon asserted its mastery over him, and an acquaintance with Paganini gave him the impulse that he needed. He accompanied his master to Paris, but here his fortune sunk so low that he thought of drowning himself in the Seine. The patronage of a lady of rank saved him, and soon he rose to fame as a violinist. His style of playing was in some respects like that of Paganini. He was received in Italy with prodigious enthusiasm, and after visiting England, Scotland, and Ireland, he made a tour of triumph through Russia, Germany, and Norway. In 1844 he sailed to America, whence he returned three years later. In 1855 he went out once more, and made enormous sums by his concerts, much of which he lost by unfortunate land speculations, especially an attempt to found a colony of Scandinavians in Pennsylvania. This turned out a complete fiasco, and once more Bull had to take to his violin. He afterwards paid a third visit to the United States, but returned to end his days in Europe. He died at his villa near Bergen, 17th August 1880. If it is not true that he was half charlatan, half genius, it may be said with truth that he was quite as much a bizarre virtuoso as a great artist. His compositions have had but little reputation apart from his own playing. See the Memoir by Sara C. Bull (1886).

Bulla, or BUBBLE-SHELL, a genus of Gasteropod Molluscs, formerly somewhat ambiguous, but now defined as one of the Tectibranchs or 'snails' with concealed posterior gills. In the family (Bullidae) to which the bubble-shell belongs, the shell is thin, often almost globular, with concealed spire and wide aperture. It serves to protect the gills, and less frequently the entire animal. In some cases it is quite covered by the mantle and foot lobes. In the closely allied Haminea, the shell is horny and elastic; in the Sea-hares (*Aplysia*) it is very rudimentary; in some of the likewise nearly related Philinidae it is entirely absent. The Bullidae are carnivorous, and limy plates in the gizzard aid in internal mastication. There are numerous fossil and living species, all marine, and some British. See GASTEROPODS.

Bulla aperta.

Bulla, a metallic seal. See BULL, and SEAL.

Bullace (*Pruus insitita*), a shrub or small tree, larger and much less spiny than the sloe, but very closely allied to it, as it is also to the plum, so that many botanists regard them all as one species (see PLUM). The fruit is larger than the sloe, generally globose, and although it partakes in some degree both of the acidity and the roughness of the sloe, it is not unpleasant, especially after having been mellowed by frosts, and makes excellent pies or tarts. 'A bullace-pie is a standing dish at the harvest-home supper in the south of England, only it requireth rather more sugar than the housewife is always willing to allow.' The bullace is common in hedges, coppices, and banks in England, and in many parts of Europe, and is sparingly naturalised in the United States.

Bullace-plum, the Jamaican name of the pleasant fruits of *Melicocca bijuga*, a sapindaceous tree introduced from Guiana and New Granada.

Bulle, or BLEBS, are collections of serous fluid of considerable size, situated immediately beneath the cuticle, and raising it from the true skin. They differ from vesicles only in size; and no very definite line can be drawn between a large vesicle and a small bulla. They usually vary in diameter from a quarter of an inch to two inches. The most familiar examples are the 'blisters' produced on the hands by rowing, or the feet by walking. They are met with occasionally in many diseases of the skin—e.g. eczema, erysipelas, urticaria, scabies, &c.; but in pemphigus and in some forms of hydroa they constitute the chief feature of the disease.

Bull-baiting, a barbarous sport, once very popular in England, and in which all classes of society delighted equally. A number of dogs were set on to attack a bull; and in order that he might be made as furious as possible, his nose was sometimes blown full of beaten pepper before he was turned loose. Another form of the sport was to fasten the bull to a stake, by a rope of some yards' length, and to set bulldogs on him, one at a time, which were trained to seize him by the nose—which, when accomplished, was called *pinning* the bull. But no small part of the enjoyment of the spectators was derived from the success with which the attacks of the dogs were met by the bull lowering his head to the ground, and receiving them on his horns, often tossing them to a great distance. King James I. greatly delighted in this sport; and when the Czar Nicholas of Russia visited England, before his accession to the empire, a boxing-match and a bull-baiting were got up to show him English tastes. Bull-baiting was declared illegal in 1835.

An equally barbarous sport, termed *Bull-running*, was formerly practised at Stamford and Tutbury, where men and women took the place of dogs, maddened the bull with hideous noise, and then pursued it with 'bull-clubs,' till the wretched brute sank under the blows of its assailants.

Bulldog, a breed which is regarded as peculiarly English, the only country in which it has been kept pure. The bulldog disputes with the greyhound the honour of being the oldest known dog. The general appearance of the bulldog is that of a smooth-coated, compact dog, low in stature, but broad and powerful, with a massive head, large in proportion to its body, which is short and well knit. The bulldog should convey an impression of determination and strength, without unwieldiness. The following are its principal points: Head as large as possible, measuring over 20 inches in circumference in first-rate specimens;

Bulldog.

forehead flat, with the skin much wrinkled, with a groove or indentation called the 'stop' running up between the eyes; ears small and thin, folding over at the back, showing the inside; eyes round, black, and not bloodshot; the face very short, the nose being set almost between the eyes, allowing the dog to breathe while pinned on to the bull in the old days of bull-baiting; upper lip joining the lower, quite covering the teeth, which should not project; shoulders sloping back and muscular; body well ribbed up, with the belly tucked up; back short, narrow at the loins, the spine rising from the shoulders to the loins, and curving to the tail, forming an arch, a characteristic of the breed termed 'roach-back'; the tail short and smooth, with a slight twist which prevents it being raised high—an abortive or 'screw-tail,' though common, is not a good point; fore-legs straight boned, but carried wide apart, presenting a bowed appearance; action, a peculiar roll, the body swinging between the fore-legs; colour, brindle, white, or fawn; weight, about 50 lb. The bulldog was extensively used for Bull-baiting (q.v.), whence he derives his name. After

Bull-terrier.

Bull-baiting (q.v.), whence he derives his name. After

the abolition of this pastime the breed fell into discredit, till his qualities as a devoted and faithful companion gradually restored his popularity. The bulldog shares with the gamecock the distinction of being the most fearless of animals, but in disposition is so lazy that he is slow to take offence, though he will fight to the death if attacked.

The BULL-TERRIER was originally a cross between the bulldog and the terrier, but is now a distinct breed. He combines the courage of the bulldog with the activity of the terrier; his quickness and sagacity make him a good companion, though somewhat quarrelsome. Head long, with pointed muzzle; ears naturally large and erect, but generally cut to a fine point; body lightly ribbed but powerful; colour, pure white.

Buller. CHARLES, born in Calcutta in 1806, was educated partly at Harrow and at Cambridge, but during 1822-24 was Carlyle's pupil at Edinburgh. He was called to the English bar in 1831, and entering parliament as a philosophical Radical before the Reform Bill, continued a member till his untimely death, 29th November 1848. He accompanied the Earl of Durham (q.v.) to Canada as his secretary, and was credited with the main share in writing the Governor-general's famous report on Canadian constitutional reforms.

Buller. SIR REDVERS HENRY, born in 1839, entered the army in 1858. He served in China (1860), the Red River expedition (1870), the Ashanti (1874) and Kaffir (1878) wars, the Zulu war (1878-79, where he won the V.C.), and the Egyptian war. He was made C.B. in 1874, K.C.M.G. 1882, K.C.B. 1885, lieutenant-general and G.C.B. in 1894. In 1898 he had the chief command at Aldershot, and was sent to South Africa as commander-in-chief in 1899, but on the arrival of Lord Roberts he assumed the divisional command in Natal, where, after very severe fighting, he succeeded in raising the siege of Ladysmith.

Bullet is the leaden projectile discharged from any kind of small-arm. Formerly all bullets were spherical, and cast in moulds. Now all rifle-bullets are elongated, and cut and stamped by machinery from rods of lead. The forms are singularly numerous. Robins's bullet was egg-shaped, with the centre of gravity at the larger end; Beaufoy's was ovoid, with a hemispherical cavity at one end; Greener's was oval, with a plug of mixed metal driven into a hole barely large enough for it; Norton's, Delvigne's, and others were of various shapes, generally with some kind of plug, which, driven

This expanding or dilating action has been claimed by many inventors; but the government in 1857 awarded Mr Greener £1000, as the person who had practically solved the difficulty as far back as 1836. Its effect is to communicate a twist to the bullet, thus steadying it, and causing it to travel point first. This enables a heavier, because longer, projectile to be fired with accuracy from a smaller bore than was formerly used; thereby presenting less surface to the resistance of the air, and so increasing the range.

The Prussian bullet does not touch the grooves; the *sabot* takes them and communicates the twist to the bullet. The shoulders of the Chassepôt bullet and the slight taper in the Martini-Henry are for the same purpose. Hollow-headed explosive bullets are only used for shooting big game, such as elephants and tigers. Their use in war is forbidden by the Convention of Geneva.

The bullet of the Lee-Metford rifle (see RIFLE), which consists of a lead core covered with a nickel casing, weighs only 217 grains, as compared with the 384 grains of the Enfield-Martini of 1888. The *dum-dum* bullet was devised and made by the Indian military authorities in their arsenals at Dum-dum, near Calcutta, and is similar to the ordinary Lee-Metford bullet, with the point flattened and the lead exposed instead of being covered by the nickel casing. This caused it to expand when it struck, and made it much more effective than the original bullet. The soldiers in the Indian frontier wars filed off the points of the bullets themselves in imitation of the *dum-dum*. A Lee-Metford bullet (Mark IV.), with a hollow in the front end, intended to have the same 'stopping' property as the *dum-dum*, was issued for service in the British army in 1899; but it was not used in the Transvaal war (1899-1900) on account of its being considered an 'explosive bullet.' It is shown in the figure. See CARTRIDGE, RIFLE; and, for steel bullets, MACHINE GUNS. SHOT is treated in a separate article.

Bullet-tree, or BULLY-TREE (*Mimusops balata*), a sapotaceous tree found in Guiana, and valued for its wood, which is solid, heavy, close-grained, and durable, and also for its delicious cherry-like fruit. It yields balata-gum, a valuable substitute for india-rubber. The name is somewhat vaguely shared with other fruit-bearing congeners. Thus *Bumelia retusa* is the Bastard Bully-tree, and *B. ingens* the Black Bully-tree, while *Lucuma mammosa*, of which the fruit is called the marmalade, is sometimes called Jamaica Bully-tree.

Bull-fight. Combats of men with bulls for the entertainment of the public were common in Greece, particularly in Thessaly, and in Rome under the emperors, though in later times they were forbidden both by emperors and popes. They are still a favourite spectacle in Spain and Mexico, where, indeed, the *corridu de toros* is the national pastime. In Spain they were abolished by Charles IV.; but Joseph, Napoleon's brother, re-established them out of policy, the mass of the Spanish population being passionately fond of the sport. The most magnificent bull-fights were at one time instituted by the monarchs themselves; at present, both in the capital and in the larger towns of Spain, they are held either as private speculations or for the benefit of public institutions. So also in the city of Mexico, where in the season of 1887 nearly £70,000 was spent in fitting up the six rings in which bull-fights are held. In Madrid the bull-fighting season commences in April and lasts until November. During that time there is at least one Sunday or Saint's-day afternoon in every week devoted to the sport. The proceeds go to the funds of the public hospital. The

MODERN RIFLE-BULLETS.

into the lead by the force of the explosion, caused it to expand and take the grooves in the barrel.

fight take place in a kind of circus, called the *Plaza de Toros*, round which the seats rise one above another, like the steps of a stair, with a tier of boxes over them. The *Plaza* is capable of containing from 10,000 to 15,000 people, who pay a high price of admission, considering the rate of wages in Spain; and all go attired in their best to the spectacle. The Castilian bulls, usually chosen for fight in Madrid, are fiercer and more active, but inferior in strength to British animals. The horses engaged in the conflicts are worthless brutes, fit only for the knacker. The men employed in the fight are generally those who have been bred to it as a profession; but occasionally amateurs may take part in it.

The bull-fight has been described as a tragedy in three acts. The principal performers in the first are the *picadores*; in the second, the *chulos* are the only actors; the third and last act devolves solely on the *espada*. The *picadores* are all mounted, dressed like Spanish knights of the olden time, and armed with a lance; they take up their position in the middle of the circus, opposite the bull-stalls. The *chulos*, who are on foot, are gay with ribbons, and wear very bright-coloured cloaks; they distribute themselves in the space between the barriers. The *espada* or swordsman is also on foot. He is handsomely dressed, and holds in the right hand a naked sword, in the left the *muleta*, a small stick, with a piece of scarlet-coloured silk attached. On a sign given by the president of the sport, a bull is let out from the stalls; the *picadores* stand ready in the arena waiting his charge. With a brave bull, they find all their skill requisite in acting on the defensive; with a cowardly one, they act on the offensive; and should their stabs be ineffectual in rousing the animal to the requisite fury, the poor beast is hooted by the crowd, and ultimately stabbed ingloriously in the spine. Whenever a horse is wounded, the rider betakes himself to flight; and when either the above casualty happens, or a *picador* is thrown, the *chulos* rush in, and attract the bull by their cloaks, saving themselves, if need be, by leaping over the barrier which incloses the circus. At the same time, another *picador* calls off the bull's attention to himself by shouting. When the bull begins to flag, the *picadores* are succeeded by the *chulos*, who bring with them the *banderillas*—i.e. barbed darts about two feet long, ornamented with coloured paper-flags, which they stick into the neck of the animal. Sometimes these darts have crackers attached to them, the explosion of which makes the bull furious. The *espada* now enters alone to complete the tragic business. As soon as the bull's eye catches the *muleta*, he generally rushes blindly at it; and then the *espada*, if well skilled, dexterously plunges the sword between the shoulder-blade and spine, up to the very hilt, and the animal drops dead at his feet. A splendid team of mules then enter, glittering with flags and tinkling with bells, who drag off the slain at a gallop. The victorious matador is greeted with acclamations, and not less so the bull, should he wound or even kill his antagonist, in which case another matador steps forth into the arena; but human life is rarely sacrificed. From six to ten bulls are usually despatched in a single day, twenty minutes being about the time usually taken to slay one. It has been computed that about 2500 bulls and 3500 horses are annually killed in Spanish bull-fights.

Every large town in Spain possesses a *Plaza de Toros*, and so do many towns in Spanish America; those of Madrid, Seville, and Caceres are especially handsome. Bull-fighters personally are esteemed much as prize-fighters are in England; but they are the idols of the lower classes, from whose ranks they are drawn. Formerly, those

who were killed on the spot, and died without confession, were denied burial rites; but a clergyman is now in attendance with the consecrated host, in case of accident.

Bullfinch (*Pyrrhula rubricilla* or *vulgaris*), a bird of the great finch family Fringillidæ (q.v.), a little larger than the common linnet, and of a genus closely allied to the grosbeaks and crossbills. The genus is particularly characterised by the short, thick, rounded bill, of which the sides are inflated and bulging, and the tip of the upper jaw overhangs that of the lower one. The plumage is very soft and dense. The crown of the head, the long wing-feathers, and the tail are shining black. The back of the male is ashy gray, that of the female brownish gray. The under surface of the male is a bright tile-red, that of the female bluish gray. There is a conspicuous white bar across the wing. The tail of the bullfinch is almost even.

Bullfinch.

This bird is not unfrequent in England, Ireland, and the south of Scotland; and is found in most parts of Europe, from the south of Norway to the Mediterranean, extending eastward throughout Asia, even to Japan. It frequents woods and gardens, and builds its nest in trees or bushes a few feet from the ground. The nest is loose, made of dry twigs and fibrous roots. The eggs are four in number, bluish or purplish white, spotted and streaked with purplish gray and reddish brown. It feeds chiefly on seeds and berries in winter, and in spring is excessively destructive to the buds of fruit-trees in those localities in which it is abundant, selecting the flower-buds, and apparently finding them the most palatable of all food. Selby says: 'I have known a pair of these birds to strip a considerable sized plum-tree of every bud in the space of two days.' On this account gardeners are sometimes compelled to wage war against the bullfinch. He is also deliberately adjudged to be the farmer's enemy by impartial judges (see Wood's *Farmer's Friends and Foes*, 1888).

The song of this bird, in a wild state, is very simple, but it is remarkably susceptible of improvement by education. Some trained bullfinches can whistle an air very accurately, and with a power and variety of intonation far exceeding their natural song. The ability to whistle several airs well is rare. The training of these birds is a work both of time and trouble: it is chiefly carried on in Germany. Not less than nine months of training are requisite: it begins when the bird is a mere nestling, and must be carefully continued till after the first moulting; for it is a curious circumstance, that all which has been previously acquired is very apt to be lost at that time, or is afterwards so

imperfectly remembered that the bird is of little value. The bullfinch is capable of very strong attachment to those who feed and caress it, and often becomes so thoroughly domesticated as to exhibit no desire for liberty (see CAGE-BIRDS).—Curious variations of plumage are sometimes observed in it.—Other species of the genus *Pyrrhula* are known, natives of different parts of the world; and in this genus some ornithologists include *Corythus* of Cuvier, of which one species, the Pine-finch or Pine Grosbeak, is a native of Britain. The canary (*Serinus canarinus*) is closely allied.

Bull-frog (*Rana mugiens*), a species of Frog (q.v.) found in most parts of the United States and Canada, but chiefly abundant in the southern states. It is of a large size, 8 to 12 inches long. The colour is olive green or reddish brown, with large brown or black spots, and with a yellow line along the back. The under surface is yellowish. It receives its name from the remarkable loudness of its voice, heard as a hollow bass in the frog concerts which take place in the evening and all night long in marshy places in America. Its voice can be distinctly heard at a distance of forty or fifty yards. It sits for hours during the day, basking in the sun, near the margin of a stream, into which it plunges with a great leap on the least appearance of danger. It does not confine itself to insects and worms like smaller frogs, but eats fish and other frogs, and is said to be partial to young ducks, and to swallow them entire. Audubon says 'its flesh is tender, white, and affords excellent eating,' the hind-legs, however, being the only part used. He adds that these parts make excellent bait for the larger cat-fish, and that he generally used the gun for procuring bull-frogs, loading with very small shot.

Bullhead, or MILLER'S THUMB (*Cottus gobio*), a small fish in the Acanthopterygii subdivision, abundant in clear rivers and streams, in some parts of the British Islands, throughout the greater part of Europe, and in the north of Asia. It seldom exceeds 3 or 4 inches in length. The colour varies somewhat with the activity of the fish, but is brown on the upper parts, and white beneath.

Bullhead.

The fins are rather large, prettily spotted, and with rays slightly produced into spines. The general appearance is not unlike that of the Gurnards (q.v.). The smoothness of the slippery skin, and the quaint depressed head, have suggested its names, that of miller's thumb referring to the flatness caused by the miller's perpetually rubbing flour between finger and thumb. The bullhead eats all sorts of little animals and the spawn of rival genera. Its own is buried in a hole, which the female makes with her tail, and over the cradle the male watches. Its flesh is delicate, and, when boiled, is reddish, like that of the salmon.—The other British species of the genus *Cottus* (q.v.) are marine. The Sea-scorpion (*C. scorpio*), or Father Lasher, is a common form which sometimes ascends rivers. The name bull-head is not usually given to any of them. A

sea-fish of a nearly allied genus (*Aspidophorus*) is sometimes called the Armed Bullhead; it is also known as the Pogge (q.v.).

Bullinger, HEINRICH, a Swiss Reformer, was born at Brengarten, in the canton of Aargau, July 18, 1504. The son of a priest, who later embraced the reformed doctrine and married the mother of his five sons, he became acquainted with the writings of Luther during his studies at Cologne; next he attended the theological expositions of Zwingli at Kappel, and accompanied his master to the religious conference held at Bern in 1528, which resulted in the reformation of the canton. In 1529 he married a former nun, and two years later became pastor of the principal church at Zurich, and Zwingli's successor as leader of the reformed party in its struggle with the Catholics, as well as with the Zealots and the Lutherans. He took a principal part in drawing up the first Helvetic Confession at Basel in 1536, and aided by his counsel the struggling church both in France and England. He died September 17, 1575. Part of the story of his Life he wrote himself in his *Diarium*. His history of the Reformation was edited by Hottinger and Vögel (3 vols. 1838-40). See the Lives by Pestalozzi (1858) and Christoffel (1875).

Bullion usually means uncoined gold and silver in bars or other masses, though occasionally it is used as practically synonymous with the precious metals, coined and uncoined. The origin of the word bullion in its present sense, as well as that of the French *Billon* (q.v.), and the corresponding Spanish *vellon*, seems to be as follows: Bullion originally meant the mint, where the alloy for the coinage was prepared and the coin stamped (either from the Lat. *bullu*, a round boss or stud, or stamp; or from the verb *bullare*, to boil or bubble); and hence it came in England to signify the standard metal of which the coins are made. In France, where the kings debased the currency much more than ever took place in England, *billon*, the mint, came to signify the base mixture issued therefrom.

It is difficult to obtain trustworthy statistics regarding the production and consumption of the precious metals even at the present time, and still more so at remote periods. For ancient and mediæval times the reader may consult Jacob's *Historical Inquiry into the Production and Consumption of the Precious Metals*, published 1831, which was long regarded as the standard work on the whole subject. Recently, however, Dr Adolph Soethoer has made much more thorough investigations for the period 1493-1885, and his *Materials for the Study of the Precious Metals* is now the work most generally relied upon.

As regards the production of the precious metals, two great revolutions are to be observed in the 16th and 19th centuries. Between 1493-1520 the total production of gold and silver was in the proportion of about 57 per cent. of gold to 43 per cent. of silver (the value being reckoned at the actual value of the time), whilst between 1581-1600 the proportion became (in value) 17·2 gold to 82·8 silver. This change was principally due to the discovery of the silver mines of Potosi (1545). Between 1831-40 the production (in value) was 34·9 gold to 65·1 silver, and for the period 1851-55 the proportion had become 77·6 gold to 22·4 silver. This change was caused by the discovery of the great gold mines in Australia and California. The magnitude of these discoveries may be estimated from the fact that between 1493-1850 (358 years) the total production of gold is given at 4,752,070 kilograms, whilst between 1851-85 (35 years) it is given at 6,383,388 kilograms. The value of a kilogram of gold is £139, 10s. Since 1855 the relative

production of gold to silver has gradually declined, the figures for 1881-85 being 49·3 gold to 50·7 silver. The total production of gold (in value) was (1493-1850) about £663,000,000, and from 1851-85 about £890,000,000; the total production of silver (estimated at its actual gold value at different times) was (1493-1850) about £1,472,000,000, and from 1851-85 about £480,000,000.

The most remarkable circumstance in these changes in the relative amounts of gold and silver produced is the slight effect on the ratio between gold and silver. Before the discovery of the rich silver mines of Potosi the ratio was (1521-40) about $11\frac{1}{4}$: 1, and from 1601-20 it was only $12\frac{1}{4}$: 1. Again, just before the great gold discoveries in this century (1841-50) the ratio was $15\cdot83$: 1, and between 1851-55, in spite of the enormous increase in gold, it fell only to $15\cdot41$: 1. See BIMETALLISM.

The production of the precious metals must of course be compared with their consumption or use. The principal uses are for coinage, including keeping up the coins to their full weight, for the arts, and for hoards. The statistics are largely conjectural, and are given by Dr Soetboer with due reserve. The most interesting conclusion is the large increase in the use of gold for the arts and for exportation to the East, more than five-sixths of the annual supply being used for these purposes.

Bullock's Heart. See CUSTARD APPLE.

Bull-roarer. a provincial English name for a boy's plaything, made of a piece of wood about 8 inches long and 3 broad, sharpened somewhat at the ends, to one end of which a string 30 inches or so in length is tied, then twisted tightly round the finger, when the whole is whirled rapidly round and round until a loud and peculiar whizzing noise is produced. An instrument of the same kind, called *turudun*, is still used by the native Australians to produce a sound warning off intruders during several religious mysteries; and Mr Andrew Lang has not only collected evidence of its similar use in New Mexico, New Zealand, and South Africa, but identifies it with the *rhombos* used in the ancient Greek mysteries, itself an unconscious survival of more ancient and more savage mysteries. See 'The Bull-roarer,' in Lang's *Custom and Myth* (1884).

Bull Run. a small stream separating Fairfax and Prince William counties in Virginia, about 25 miles W. by S. of Washington, and giving its name to a famous American battlefield, where two battles were fought during the civil war on July 21, 1861, and August 29, 1862. In the first, the Confederate army of 22,000 men, commanded by Beauregard, with reinforcements of 8000, after a hard-fought contest, routed the Union forces, 34,000 strong, under McDowell, and drove them back on Washington with a loss of 2950 men. The Confederates' loss was 1652. In the second battle, the Union forces of 49,000 men, under Pope, were defeated by Longstreet, with 32,000 men, and T. J. Jackson, with 23,000. The Union loss was 11,000, that of the Confederates 7241. See UNITED STATES.

Bulls and Bears. In the slang of the stock exchange, a *bull* is a person who seeks artificially and unduly to raise the price of stock, and speculates on a rise. On the other hand, a *bear* is one who speculates on a fall; who sells stock for delivery at a future date, in the hope that meanwhile prices will fall, so that he will buy at a lower price what he has sold at the higher price. See STOCK EXCHANGE.

Bull Trout (*Salmo cambricus* or *griscus*), a species of the Salmon genus, and like it, migratory in its habits, ascending rivers, in which it deposits its spawn, but living chiefly in the sea. It

occurs in many of the rivers of Britain, and is not unfrequently taken in the Tweed and its tributaries. It is frequently called the Gray Trout,

Bull Trout (*Salmo cambricus*).

or simply the Gray, and is the Sewen of the Welsh rivers. It occasionally attains the weight of 20 lb., although even the larger ones are commonly under 15 lb. weight. It is less elegant in form than the salmon; the head and nape of the neck are thicker in proportion; the teeth are longer and stronger; the gill-cover is larger and more nearly square; the anal fin is further back; and the tail, beyond the adipose fin, is more bulky and muscular. The tail fin is square at the end in young fish (in some places called *whittlings*), and in older ones becomes convex by the elongation of the central rays, whence the name *roundtail* sometimes given to this species. The scales are rather smaller than those of a salmon of equal size, the lower jaw of the male less elongated; the colour is less bright; the males in the spawning season being reddish or orange brown, the females blackish gray; at other times the general colour is like that of the salmon trout. The bull trout agrees with the salmon in having only a few teeth on the most anterior part of the *vomer* (the bone which runs down the centre of the palate); while the salmon trout, the common trout, and the great lake trout, have a long line of teeth in that position. To anglers, the bull trout is next to the salmon as a prize, and by many is mistaken for it. The flesh is paler in colour, coarser, with much less flavour, and is proportionately less esteemed.—The name has been also given to the Hucho (*S. hucho*), or salmon of the Danube, which sometimes attains the size of 30, or even, it is said, of 60 lb. The laws for fishing salmon apply also to the Bull Trout. See SALMON.

Bülow. FRIEDRICH WILHELM, BARON VON, Prussian general, was born in 1755, and entered the army young. When Prussia declared war with France in 1813, it was Bülow that commanded in the first successful encounter with the French at Möckern, and revived the self-confidence of the army after the adverse battle of Lützen. His victories over Oudinot and Ney at Grossbeeren and Dennewitz saved Berlin, and inflicted severe loss on the enemy. He acted a conspicuous part in the battle of Leipzig, and, by taking possession of Montmartre, finished the campaign of 1814. The king acknowledged his services by an estate worth £30,000, and the title of Count of Dennewitz. In the campaign of 1815 he joined Blücher by forced marches, and headed the column that first came to the aid of Wellington at Waterloo. He died at Königsberg, February 25, 1816.

Bülow. HANS GUIDO VON, pianist and composer, was born at Dresden, 8th January 1830, the son of Karl Eduard von Bülow (1803-53), poet and author. Hans studied music with zeal, and after being sent to Leipzig and Berlin to qualify for

a legal career, resolved to give himself to music. Having spent some time with Richard Wagner, he in 1857 became the pupil of Liszt, whose daughter he married. In 1854 he became Prussian court-pianist, in 1864 pianist to the Bavarian court, and head of a music-school at Munich. In 1869 family troubles led him to resign his appointments and retire to Florence; and subsequently he undertook great concert tours in England and America. In 1880 he settled as director of music to the court at Meiningen; and after a year in a Berlin lunatic asylum, he died at Cairo in Egypt on the 13th February 1894. One of the most brilliant pianists of his time, remarkable for his extraordinary memory and unparalleled skill in conquering technical difficulties, he was famous as a concert director, and as a representative of the Liszt-Wagner school. He produced works for piano and for the orchestra, as also numerous editions of pieces by the great musicians, with arrangements and translations from Berlioz, Wagner, and Liszt.

Bulrush, an English popular name for large rush-like or reed-like plants growing in marshes, not very strictly limited to any particular kind. The application of the term, both in literature and botany, has hesitated particularly between two distinct plants of tolerably similar vegetative habit—*Typha latifolia* and *Scirpus lacustris*. The former

Bulrush:

A, Common Cat's-tail (*Typha latifolia*); B, Common Bulrush (*Scirpus lacustris*).

of these, also called Reed-mace or Cat's-tail, belongs to the Typhaceæ; it is a large handsome plant of grass-like habit, and reaching a height of 5 to 7 or 8 feet. The characteristic long flowering heads bear the male above the female flowers, although other species are dioecious. The cloud of pollen is collected to adulterate the Lycopodium (q.v.) of pharmacy; the rhizome is astringent, but contains starch used by the Kalmucks; and the shoots of this and allied species are eaten by the Don Cossacks, and hence are sometimes called Cossack Asparagus. The stems of bulrushes are used in

many countries for thatching and fuel, the leaves for mats, chair-bottoms, packing, &c. The woolly fruiting heads are also used as packing material, and in combination with feathers to stuff beds.

The other and apparently rightful claimant of the name bulrush belongs to the Cyperaceæ. There are about 50 species of *Scirpus*, widely distributed through all climates, and applied to almost identical uses with the preceding where they sufficiently abound. It is easily recognised by its compound umbel-like (but probably cymose) heads of spikelets. One species, *S. tuberosus*, is cultivated in India as a source of starch. The common British species may reach a height of 8 feet, and like *Typha* grows in vast swamp jungles along the margins of lakes and slow-running streams, to which they impart a characteristic picturesqueness. *S. maritimus* grows extensively along the shores of the Baltic.

Bulsar, a seaport of India, 115 miles N. of Bombay by rail. Timber is exported. Pop. 14,330.

Bultfontein. See **KIMBERLEY**, CAPE COLONY.

Bulti, the northern part of Cashmere (q.v.).

Bul-tso ('Borax Lake') is a lake of Tibet, 100 miles NW. of Lassa. Its area is 24 sq. m.

Buluwayo, or **BULAWAYO**, capital of Matabeleland, is 400 miles from Beira on the Pungwe Estuary, connected with Cape Colony by telegraph. Once Lobengula's kraal, it was successfully defended during the Matabele troubles of 1896.

Bulwer, **HENRY LYTTON**, diplomatist and author, was born 13th February 1801, the second son of General Bulwer, and an elder brother of Lord Lytton. Entering the diplomatic service in 1827, he was attached successively to the British embassy at Berlin, Brussels, and the Hague. In 1830 he was returned to parliament, and during the following seven years represented, as an advanced Liberal, the constituencies of Wilton, Coventry, and Marylebone. In 1837 he became secretary of embassy at Constantinople, where he negotiated and concluded a very important commercial treaty. In 1843 he was made minister plenipotentiary to the court of Madrid, and, as arbitrator, negotiated the peace between Spain and Morocco in the following year. His firmness and candour offended Narvaez, the Spanish marshal-dictator, who, pretending to have discovered Bulwer's complicity in certain plots, ordered him to leave Madrid. The House of Commons indorsed the whole course of his conduct, and he was made a K.C.B. in 1848, a G.C.B. in 1851. In 1849 he proceeded to Washington, where he concluded the Clayton-Bulwer Treaty (q.v.); in 1852 to Florence, and in 1856 to Bucharest. From 1858 to 1865 he was ambassador to the Ottoman Porte, and as successor to Lord Stratford de Redcliffe, ably carried out Palmerston's policy on the Eastern Question. In 1871 he exchanged the familiar title, Sir Henry Bulwer, for that of Lord Dalling and Bulwer. He died at Naples, 23d May 1872. Among his works were *An Autumn in Greece* (1826); *France, Social, Literary, and Political* (1834-36); *A Life of Byron* (1835); *Historical Characters* (1868-70); and an unfinished *Life of Palmerston* (1870-74).

Bulwer Lytton, **SIR EDWARD**. See **LYTTON**.

Bumboat, a boat employed to carry provisions and other articles from harbours and ports to vessels lying at some distance from the shore. Boats of this kind belong to a class of petty traders, who in England are, for the most part, women.

Bummaloti. See **BOMBAY DUCK**.

Bunbury, **HENRY WILLIAM**, caricaturist, was the son of the Rev. Sir William Bunbury, and was

born at Mildenhall in Suffolk in 1750. Educated at Westminster and Cambridge, he early became distinguished for his humorous designs, which gave him the right to rank after Rowlandson and Gillray. He usually avoided political subjects. He drew mainly in pencil and chalks, but also produced water-colours. He died in 1811. His son, Sir Henry Edward Bunbury, seventh Bart. (1778-1860), wrote several historical works, including one on the Peninsular war.

Bunrana, a watering-place on Lough Swilly, 12 miles NW. of Londonderry by rail. Pop. 735.

Bundaberg, a port of Queensland, at the mouth of the Burnett River, and 272 miles N. of Brisbane by rail, in a great sugar-growing district. It was destroyed by a flood in February 1893.

Bundelesh is the name of a Pehlevi book in the language, which is an authority on Zoroastrianism. See ZEND.

Bundelkhand, a region of Upper India, between the rivers Chambal and Jmuna. It includes five districts belonging to the British North-western Provinces (Banda, Jalaun, Jhansi, Lalitpur, and Hamirpur), and also the 'Bundelkhand Agency,' a subdivision of the Central India Agency, which is a group of some 30 native states and petty jaghires under native princes. The area of the agency is 10,332 sq. m., and the population about 2,500,000; whilst the figures for the agency are 10,241 sq. m., and (1891) 1,480,095. Notwithstanding that it is well watered, the climate renders irrigation indispensable; and it is accordingly interspersed, at the cost of great labour and ingenuity, with artificial dams and a canal. It possesses deposits of iron ore, diamonds (in Panna), and copper, but the produce is almost solely agricultural. The principal towns of Bundelkhand are Kalpi, Jhansi, Kalinjar, Banda, Jalaun, Chhatarpur, and Datia.

Bundi, a native state of Rajputana, lying between Jaipur, Tonk, Kotah, and Udaipur. It is traversed from SW. to NE. by a double range of hills, has large tracts of woodland, and is drained by the river Mej. Area, 2300 sq. m.; pop. 295,675, nearly all Hindus. The chief town, Bundi (pop. 22,544), built on the steep side of a hill, commands the principal pass, and has upwards of 425 temples and shrines.

Bundoran, a watering-place on Donegal Bay, 4 miles SW. of Ballyshannon. Pop. 764.

Bungalow, the species of house usually occupied by Europeans in the interior of India, and commonly provided for officers' quarters in cantonments. Bungalows are properly of only one story, with a veranda, and a pyramidal roof, generally of thatch, although tiles are sometimes substituted; houses of masonry, with terraced roofs, are distinguished as *pukka houses*. The name is a corruption of the native word *Banglā*, 'Bengalese,' and probably refers to the first district where the form of building was noticed by Europeans.—*Dāk-bungalows* are houses for travellers, still to a reduced extent maintained by government, where bed, table, and bathroom are provided, and food can be had at a moderate cost. A rupee a day is charged for the use of these bungalows, which are found on the main routes every 10-15 miles, and on the less frequented roads at intervals of 40-50 miles.

Bungay, a market-town of Suffolk, on the Waveney, 6 miles W. of Beccles. It grew up around the 12th-century castle of the Bigods, Earls of Norfolk, some ruins of which still remain; but mostly it is later than the great fire of 1688. It has a large printing establishment, and carries on a considerable trade in corn, malt, flour, coal, and lime. Pop. 3560.

Bungener, LOUIS FELIX, Protestant writer, born at Marseilles, of German family, in 1814, studied theology at Geneva, and became director of the gymnasium there in 1843, but was removed by the new Radical government in 1848. Engaging in literature, he published a series of writings on theological and historical subjects, but is most widely known for several works, in the form of romances, in which the principles of Protestantism are set forth and defended. He died 14th June 1874.

Bunias, a small genus of Cruciferae. The leaves of *B. orientalis* are eaten in Russia, and are cultivated in Western Europe as a fodder-plant. The leaves and root of *B. crucago* are eaten in Greece.

Bunion is a term applied in Surgery to enlarged bursae, or synovial sacs, situated on any part of the foot; but most common over the metatarso-phalangeal joint of the first or the fifth toe (see FOOT), and accompanied by more or less distortion of the joint. In the great majority of cases, bunions are directly produced by the pressure of badly-fitting boots; and if the boots are constructed of patent leather, or any material which stops the excreting action of the skin, this, too, may be regarded as an indirect cause of their formation. Sometimes, however, the tendency to suffer from bunions is hereditary, and almost irremediable. A bunion begins as a painful and tender spot at some point exposed to pressure; the part gradually enlarges, and there are indications of an effusion into a natural bursa or a newly-formed sac. The progress of the affection may stop here, the enlarged bursa remaining, and serving to protect the subjacent parts from pressure; but far more frequently the bunion undergoes repeated attacks of inflammation, causing further increase in size; or becomes the seat of corns or of suppuration. The last action may be followed either by obliteration of the cyst and a cure; or, especially in persons of languid circulation, by a troublesome form of ulcer. The one great thing, when there is a tendency to bunions, is the wearing of roomy boots or shoes, of soft and pervious material, and so shaped as not to press upon susceptible points. When pain occurs, wet lint covered with waterproof material, or poultices, should be applied, at all events at night. Enlargement may sometimes be reduced in its earlier stages by the application of iodine or a mercurial ointment. Where suppuration takes place, the sac should at once be laid freely open. The disease sometimes proves so troublesome that amputation of the toe, or excision of the ends of the bones affected, has been resorted to.

Bunker Hill, an elevation (112 feet) on the peninsula of Charlestown, now part of Boston, Massachusetts, connected by a ridge, 700 yards long, with Breed's Hill (75 feet). The two heights were the scene of the first hard-fought battle of the American Revolution (June 17, 1775), in which the Americans, from behind some works hurriedly constructed during the preceding night, repulsed two attacks by General Gage's forces, and were dislodged only after reinforcements had been brought up, and their ammunition was spent. The British loss was 1054, that of the Americans 449. A granite obelisk, 221 feet high, marks the site of the redoubt. See UNITED STATES.

Bunkum, a phrase used in the United States for mere bombastic speech-making, intended for the newspapers rather than to persuade the audience. There is a county named Buncombe in North Carolina, to which the word seems originally to have been due. Bartlett quotes from Wheeler's *History of North Carolina*: 'Several years ago, in congress, the member for this district

arose to address the house, without any extraordinary powers in manner or matter to interest the audience. Many members left the hall. Very naively he told those who remained that they might go too: he should speak for some time, but he "was only talking for *Buncombe*."

Bunsen, CHRISTIAN KARL JOSIAS, BARON, the distinguished German diplomatist and scholar, was born 25th August 1791, at Korbach, in the principality of Waldeck. He first studied theology at Marburg (1808), and then philology under Heyne at Göttingen (1809-13). His prize essay *De jurc Atheniensium Hereditario* appeared in 1813, and in that year he went to Copenhagen to study Icelandic under Finn Magnussen. He spent some months of 1815 in Berlin, and there became acquainted with the historian Niebuhr. In 1816 he went to Paris, and studied Persian and Arabic under Silvestre de Sacy, and in the same year to Rome, where he married Frances Waddington (1817), and was appointed (1818) secretary to the Prussian embassy on the recommendation of Niebuhr, then Prussian ambassador. On Niebuhr's departure from Rome (1824), Bunsen, who during Friedrich-Wilhelm III.'s visit to Rome in 1822 had gained the king's favour by the frank expression of his views on the Prussian ritual and hymn-book question, conducted the embassy provisionally for a time, and was appointed resident minister in 1827. Bunsen employed the years of his Roman sojourn partly in the study of Plato and the constitutions of antiquity; and still more in biblical inquiries, Egyptology, and researches into the history of the Christian church and its liturgies. He contributed largely to the *Beschreibung der Stadt Rom* (3 vols. Stutt. 1830-43), and wrote the explanatory text to the volume of engravings *Die Basiliken des Christlichen Roms* (Munich, 1843). The Archæological Institute, established at Rome in 1828, found in Bunsen its most active supporter, and it was at his instance that Lepsius obtained from the Prussian government the means for his expedition to Egypt in 1842. He founded a Protestant hospital on the Tarpeian Rock, and with the help of Richard Rothe, then chaplain to the embassy, introduced into the services there a remodelled liturgy, the most part of which was afterwards embodied in his anonymous *Gesung- und Gebetbuch zum Kirchen- und Hausgebrauch* (1846), which has found very great favour in Germany. Becoming involved in the question of mixed marriages, and in the disputes between the Prussian government and the Archbishop of Cologne, he saw his position as Prussian ambassador at the papal court compromised, and, being recalled from Rome in 1838, he was appointed in 1839 Prussian ambassador at Bern. In 1841 he was sent on a special mission to London, to negotiate the erection of an Anglo-Prussian bishopric in Jerusalem, and in the next year was appointed ambassador at the English court. On a visit to Berlin in 1844, he represented the urgency for a deliberative assembly, and also made a complete plan of a constitution for Prussia closely resembling the English. In the Sleswick-Holstein question, Bunsen strongly advocated the German view, in opposition to Denmark, and protested against the London protocol of 1850, but was obliged to sign the treaty of 1852. His views regarding the part that Prussia should act in the Eastern question not being in accordance with those of his court, he ceased in 1854 to represent Prussia at the court of England, and retired to Heidelberg. In 1857 he was created a baron. The last two winters of his life were spent at Cannes, and, settling at Bonn in 1860, he died there on the 28th November of that year. In the estimation of Englishmen, Bunsen must ever hold a high place. No foreigner has ever shown a

deeper appreciation of their national characteristics, or a heartier love of their social and political liberty. Bunsen was all his life an ardent student, and all his investigations tended to the one aim which he set before himself at the beginning of his career—'the knowledge of God in man, especially in language and religion.' His eager desire for positive results and his lively imagination led him in many cases to form premature conclusions, and the fresh impulse which he gave to the studies of others has been a still greater service to religion and science than his own researches. His chief works are: *Die Verfassung der Kirche der Zukunft* (1845; Eng. ed. *The Constitution of the Church of the Future*, 1847); *Die drei ächten und die vier unächten Briefe des Ignatius von Antiochien, und Ignatius von Antiochien und seine Zeit* (Hamb. 1847); *Ägyptens Stelle in der Weltgeschichte* (6 vols. 1844-57), of which the English edition (1847-67), with many additions by Bunsen and Samuel Birch, is the more valuable; *Hippolytus and his Age* (2 vols. 1852), which was specially written for English readers, and in its second edition formed part of the extensive work, *Christianity and Mankind* (7 vols. 1854), including 3 vols. of *Analecta Ante-Nicæni*, with contributions by Lagarde and other scholars, and *Outlines of the Philosophy of Universal History as applied to Language and Religion* (2 vols.), with contributions by Aufrecht and Max Müller; *Die Zeichen der Zeit* (2 vols. Leip. 1855; Eng. trans. by Susanna Winkworth); *Gott in der Geschichte* (3 vols. Leip. 1857-58); and the *Bibelwerk für die Gemeinde*, completed by Kamphausen and Holtzmann in 9 vols. (1858-70). See Bunsen's *Memoir* (2 vols. 1868) by his widow, Frances Waddington (1791-1876), and her own *Life and Letters* by Hare (2 vols. 1879). His correspondence with Friedrich-Wilhelm IV. was published by Ranke in 1873. His five sons were Heinrich (1818-85), rector of Donington, Shropshire; Ernst (born 1819), author of *Bible Chronology* and other works; Georg (1824-96), Prussian statesman; and the diplomatists, Karl (1821-87) and Theodor (1832-92).

Bunsen, ROBERT WILHELM, a distinguished German chemist, born at Göttingen, March 31, 1811. He began the study of zoology, chemistry, and physics at the university of his native town, and continued them at Paris, Berlin, and Vienna. After having lectured at Göttingen and Cassel, he filled the chair of chemistry in succession at Marburg, Breslau, and, from 1852, Heidelberg. His papers on physics and geology, as well as on chemistry, are numerous. The charcoal pile and the burner which bear his name are in extensive use. That the hydrate of oxide of iron is an antidote to arsenic, is an important fact which was made known by him, along with his friend Berthold, in 1837. Bunsen was the first to produce magnesium in large quantities; and in 1860 he invented the magnesium light, which has proved so important to photography. But the greatest discovery with which his name is associated, is that of the spectrum analysis—made in conjunction with his friend Kirchhoff—which has been the means of working so many wonders in chemistry, and revealing so much to astronomers. Its first result was the discovery of two new metals. Besides his original work in chemistry, Bunsen proved himself also one of its most successful teachers, with a singularly happy manner of demonstration. Among his works are: *Enumeratio ac Descriptio Hygrometrorum* (1830), *Das Eisenoxydhydrat* (2d ed. 1837), *Gasometrische Methoden* (1857; English by Roscoe), *Eindeitung zur Analyse der Aschen u. Mineralwässer* (1874), and *Flammenreaktionen* (1880). The government of Baden made him a privy-councillor in 1863. He died 16th August 1899. See *Nature* for 1881. 1899.

Bunsen Burner. Probably no invention has done so much to facilitate work in the chemical laboratory as that of the Bunsen burner, so named after the distinguished chemist. Prior to its introduction, the heating by gas or oil had been unsatisfactory, owing to the imperfect combustion of the carbon causing the deposit of soot on any body in contact with the flame. Applying the principle of the Blowpipe (q.v.), a plentiful supply of air was caused to mingle with the gas before ignition, so that a smokeless flame of low luminosity but great heating power was the result. The Bunsen burner

Bunsen Burner.

has undergone many changes, by which it has been adapted to the various requirements of domestic life, but through all, the essential principle remains the same. The simplest form consists of an ordinary gas-jet, over which is placed a piece of metal tube, 4 to 6 inches long, and perforated with holes at the bottom. The gas having been turned on, air rushes in at the holes, so that when a light is applied to the upper end of the tube, a greenish-blue flame is obtained. If the air is in excess, the flame inclines to green; if deficient, a yellow flame results. The great objection to this, the original form, lies in its tendency to *burn back*, if the gas pressure be but small. When this occurs, and the flame burns at the jet, before it mixes with the extra volume of air, a long smoky flame issues from the tube, while the disagreeable odour of acetylene, C_2H_2 , a product of the imperfect combustion of coal-gas, at once becomes apparent. To remedy this drawback, wire-gauze, through which flame cannot pass, is sometimes placed over the aperture, forming a 'solid flame' burner, or the mixture of gas and air is allowed to issue through small holes or narrow slits. The purposes for which the Bunsen burner is used are very varied. For cooking, fire-lighting, heating, ironing, soldering, &c., its utility is well known, while for the production of asbestos gas-fires many ingenious forms have been devised.

Bunt, a parasitic disease of cereals, due to *Tilletia caries*, a mould belonging to the Ustilaginaceæ. See SMUT, PLANTS (DISEASES OF).

Bunter Sandstein, or 'variegated sandstone,' is the lowest member of the Triassic system. As the Trias is more perfectly developed in Germany than in Britain, the German beds are considered the typical group of this system. The bunter sandstein consists of various coloured sandstones, interstratified with red marls and thin beds of limestone, which occasionally, as in the Harz, are oolitic, but in other places dolomitic. They attain a maximum thickness of 1500 feet. The English representatives of the bunter sandstein are chiefly developed in Lancashire and Cheshire, and consist of red and mottled sandstones with beds of marl, and thick rather irregular bands of partially consolidated conglomerate called 'pebble beds.' Many species of fossil plants have been found in the bunter sandstein of Germany, consisting chiefly of ferns, cycads, and conifers. The English bunter sandstein, however, is for the most part unfossiliferous, an equisetum, one or two ferns, and a few

conifers being all the plants yet met with. But the most remarkable fossils in this formation are the remains of huge batrachians. Originally, the footprints which had been left by the animals on the moist sand were alone observed. From their resemblance to the impressions made by a human hand, the animal producing them was provisionally named *Cheirotherium* (q.v.). The subsequent discovery and examination of the remains of teeth and bones in the same beds have afforded sufficient materials to enable Owen to reconstruct an animal named by him *Labyrinthodon* (q.v.), which undoubtedly produced the footprints. (More recently these footprints have been assigned to more than one form of labyrinthodon.) These remains have been detected in Lancashire and Cheshire, as well as in Germany.

Bunting, JABEZ, Wesleyan minister, was born at Manchester in 1779, and in 1799 entered the ministry, in which he was very successful. He was president of the conference in 1820, and again in 1828, 1836, 1844. In 1835 he was chosen president of the Wesleyan Theological Institute, and he acted as second secretary to the Wesleyan Missionary Society for upwards of twenty years. He was the chief authority in all matters relating to the government and polity of Wesleyan Methodism. He died 16th June 1858. See his Life by his son (1887).

Bunting (*Emberiza*), a genus of birds in the great finch family Fringillidæ. They are nearly allied to the crossbills. The most marked characteristics are a short, straight, conical bill; a curved form of the gape, produced by a narrowing of the sides of the upper jaw, and a corresponding enlargement of the under one; and a hard rounded knob on the palate or inner surface of the upper jaw. This knob probably aids in crushing the seeds, which are a principal part of the food of these birds. The species of bunting are numerous, and may be arranged in several sub-genera.—The Common Bunting, or Corn Bunting (*E. miliaria*), is a bird considerably larger than a house-sparrow, brown, with darker streaks on the upper parts, whitish brown with spots and lines of dark brown on the under parts, and with a slightly forked tail. It is frequent, particularly in low cultivated grounds in Britain, and in most parts of Europe, extending also into Asia, living in pairs during spring and summer, but in flocks in winter, and often visiting barn-yards at that

Reed Bunting (*Emberiza schoeniclus*).

season, along with chaffinches and sparrows. It is the largest of the British buntings. It is supposed that the winter flocks in Britain are much increased by migration from more northerly regions. This bunting often passes the night on

the ground in stubble-fields, and is taken in the nets employed for catching larks, and brought with them to market. It usually builds its nest on or very near the ground. Its notes are harsh and unmusical, and sometimes sound like the clicking of knitting needles.—The Reed Bunting, or Black-headed Bunting (*E. schoeniclus*), is a species common in marshy situations, both in Britain and on the continent of Europe. It feeds much on willow and other buds. It is a very pretty little bird, in the male with black head, cheeks, and upper throat; in the female with brown instead of black, and with a white throat.—The Cirl Bunting (*E. cirlus*), of which the head is olive-green, with black streaks, and with patches of bright lemon-yellow on the cheeks and over the eyes, is a rare British Cirl, and belongs chiefly to the south of Europe and the north of Africa. To this genus belong also the Ortolan (*E. hortulanus*, q.v.), and the Yellow-hammer (*E. citrinella*, q.v.).—The Snow Bunting (q.v.), or Snowflake (*E. nivialis* of many authors), has been placed in the new genus *Plectrophanes*. The name bunting has been often very vaguely used, and many species have been almost indiscriminately called buntings or finches. The palatal knob affords the best distinctive character. North America has a large number of species of bunting.—The Black-throated Bunting (*E. Americana*) is extremely plentiful on the prairies of Texas and other south-western parts of the United States; extending, however, as far as to Ohio, and even to Massachusetts. In the middle and northern states it occurs only as a summer bird of passage. In its habits it closely resembles the Common Bunting of Europe; but the palatal knob is less hard. See Macgillivray's *British Birds*, vol. i.

Bunting, or BUNTINE, is a thin woollen material of which the flags and signals of ships are usually made.

Bunyan, JOHN, author of the *Pilgrim's Progress*, was born at Elstow, near Bedford, in 1628. His father describes himself in his will, the original of which is still in existence, as a 'braseyer,' and is ordinarily spoken of as a tinker, in which craft his eldest son John was duly trained. Sir Walter Scott, in the *Quarterly Review* of 1830, started the idea that, as Gypsies were frequently tinkers, Bunyan may have belonged to the Gypsy race. Recent researches, however, have shown that there is no historical basis for the suggestion. The name originally took the form Buningon, and the family were certainly in Bedfordshire in 1199, if not earlier. There is also documentary evidence connecting them with the identical spot where Bunyan was born, in the east fields of Elstow, as early as 1327. From the Court Roll of the manor of Elstow we find that Thomas Bonyon did fealty and suit of court for his cottage and nine acres of land to the lord of the manor in 1542 and on to 1550. In a minute of the Privy-council he is described as 'Bonyon, victualler,' and in the Court Roll of the manor as a 'common brewer of beer' and as a 'common baker of human bread.' He probably kept a little roadside inn in his cottage on the bride-road between Bedford and Wilstead. The place where he lived is also described in the same record as 'Bonyon's End,' that is, the end or extremity of the parish where the Bunyans lived. This is the name which it had evidently borne for a long time previously, and it is the name by which that part of Elstow has continued to be known down to our own day. The grandson of this Thomas Bonyon, who was Bunyan's grandfather, describes himself in his will as a 'pettie chapman,' or small village trader. According to the transcript registers from the parish of Elstow, Bunyan's father married Margaret

Bentley on the 23d May 1627, and on the 30th November 1628 their illustrious son was baptised at Elstow Church. When he was in his sixteenth year his mother and his sister Margaret died within a month of each other; and the following year Bunyan, probably under the action of a levy made by parliament upon the villages of Bedfordshire, was drafted into the army, and took part in the civil war between Roundhead and Royalist. Probably not for long, however, as he did not reach the army regulation age of sixteen till November 1644, and in June 1645 the battle of Naseby practically put an end to the war. On the disbanding of the army, Bunyan returned to Elstow, and about 1649 married a wife who brought him no dower of worldly wealth, for, says he, 'this woman and I came together as poor as poor might be, not having so much household stuff as a dish or spoon betwixt us both.' She brought with her, however, two books which had belonged to her father, the *Plain Man's Pathway to Heaven*, and the *Practice of Piety*, in which they read together, and by which Bunyan was considerably influenced. His *Life and Death of Mr Badman*, which he published in 1680, shows not a little resemblance to the first of these books. During these early days of his wedded life, he lived in the cottage at the entrance of the village of Elstow, now known as Bunyan's cottage, the house in which he was born being in the fields about a mile to the east. It was while living here that his blind child was born, and that he took such pleasure in ringing the bells in the tower of Elstow Church. It was here also that he began to pass through those deep religious experiences which he has described so vividly in his *Grace Abounding*.

During this time he was introduced by some good people at Bedford to their minister, John Gifford, a converted royalist major who had organised a little community, sometimes incorrectly described as a Baptist church, it being a church in which baptism and some other questions much debated in those days were left to the individual conscience, and not made an essential part of church life. Bunyan joined this Christian fellowship in 1653, and about 1655 he was asked by the brethren to address them in their church gatherings. This led to his beginning to preach in the villages round Bedford, and in 1656 he was brought into discussions with the followers of George Fox, which issued in his appearance as an author, his first book, *Some Gospel Truths Opened*, being published against the Quakers in 1656. This earliest effort of his pen, though rapidly written, is a vigorous production, and altogether remarkable as the composition of a working-man whose school-days had become a far-off memory. To this Edward Burrough, an eminent Quaker, replied, and Bunyan gave rejoinder in *A Vindication of Gospel Truths Opened*. Two other works were published by him, after which, in the month of November 1660, he was arrested while preaching in a farmhouse at Samsell, a little hamlet a few miles south of Ampt-hill. The imprisonment which followed upon this arrest lasted for twelve long years, during which Bunyan wrote *Profitable Meditations, Praying in the Spirit, Christian Behaviour, The Holy City, The Resurrection of the Dead, Grace Abounding*, and some smaller works. This imprisonment was in the county gaol, which stood at the corner of the High Street and Silver Street, in the centre of the town of Bedford. Bunyan was released after the Declaration of Indulgence of 1672, under which he became a licensed preacher, having been chosen by the church to which he belonged as their pastor. He had occupied this position for three years, when in the month of February 1675 the Declaration of Indulgence was cancelled, and the licenses of the

Nonconformist preachers recalled by proclamation. The following month, March 4, a warrant, signed by no fewer than thirteen magistrates, and sealed by ten out of the thirteen, was issued for his arrest. This warrant turns out to have been preserved among the Chauncy MSS., and came to light in July 1887 when these were brought to the hammer at Messrs Sotheby's. Brought to trial at the midsummer sessions under the Conventicle Act, Bunyan was sent to prison for six months in the town gaol on Bedford Bridge. It was during this later and briefer imprisonment, and not during the twelve years in the county gaol, that he wrote the first part of his memorable work, the *Pilgrim's Progress*. This was entered in the register of the Stationers' Company, 22d December 1677, and in a contemporary catalogue of books appears as licensed February 18, 1678. When first issued it was shorter than it afterwards became. It then contained no Mr Worldly Wiseman, and no second meeting with Evangelist. The discourse with Charity at the Palace Beautiful, the further accounts of Mr By-end's rich relations, the story of Dilidence, the wife of Giant Despair, and various other passages, were added afterwards in the second and third editions, which appeared in the autumn of 1678 and the early part of 1679. This was followed by the *Life and Death of Mr Baulman* in 1680; by the *Holy War*, his most memorable work after the *Pilgrim's Progress*, in 1682; and by the second part of the *Pilgrim*, containing the story of Christiana and her children, in 1684. Bunyan had been pastor of the Bedford Church for sixteen years, when, after a ride through the rain on horseback from Reading to London, he was seized with a fatal illness at the house of his friend, John Stridwick, a grocer at the sign of the Star on Snow Hill, Holborn, and here he died on the 31st August 1688, and was buried in the *Campo Santo* of the Nonconformists in Bunhill Fields.

During the sixty years of his life, Bunyan wrote something like sixty books, but he will be best remembered by three of these—the *Grace Abounding*, the *Holy War*, and the *Pilgrim's Progress*, and best of all by the last of the three. The *Pilgrim's Progress* sprang at once into fame, 100,000 copies being sold during the subsequent ten years of its author's life. It was also printed at Boston, in New England, in 1681, and a Dutch translation was issued by Joannes Boekholt of Amsterdam in 1682. This last and a subsequent edition of a superior character, issued in 1685, were illustrated by Dutch engravers, then the leaders of the art of engraving in Europe. The book was also translated into Welsh, Walloon French, German, Polish, and Swedish, between 1688 and 1743. Since then it has been translated into no fewer than eighty-four languages and dialects, the versions in Japanese and the Canton vernacular being admirably illustrated by native artists, who have adapted the scenery and costumes to those of their own country. Traces of the influence of the work upon Schiller have been pointed out in his two poems, 'Der Pilgrim' and 'Die Sehnsucht,' by Gustav Kettner; and Wieland mentions that he first learned English from the *Pilgrim's Progress*. Of the English issue six copies of the first edition of the first part are in existence, and a complete series of editions down to the thirty-fourth, with the exception of the seventeenth. Since the thirty-fourth no record has been kept, the editions becoming in number numberless. An incomplete folio edition of Bunyan's general works was published in one volume in 1692, and complete editions in two volumes folio were issued in 1736-37, and in 1767. A folio edition in one thick volume of 1112 pages, double columns, was also published in Edinburgh by Henry Galbraith in 1771, and various other collected editions in quarto

and octavo were subsequently issued in England, Scotland, and America. A statue of Bunyan was unveiled in Bedford in 1874. See the *Lives* of him by Southey (1830), Olfor (1862), Froude (1880), and the present writer (1885; new ed. 1888).

Bunzlau, a town of Prussian Silesia, on the Bober, 25 miles WNW. of Liegnitz by rail, manufactures earthenware, woollens, glass, and hosiery, and there is trade in corn, wool, and cattle. Here Opitz was born. Pop. 12,921.—**JUNG BUNZLAU** (Czech *Mladá Boleslav*) is a town of Bohemia, on the Iser, 32 miles NE. of Prague by rail, manufacturing woollens, starch, spirits, and soap. It was once a centre of the Bohemian Brethren. Pop. 11,518.

Buol-Schauenstein, KARL FERDINAND, COUNT, Austrian statesman, born 17th May 1797, was minister in succession at Karlsruhe, Stuttgart, Turin, and St Petersburg. He was second Austrian plenipotentiary at the Dresden Conference (1850), after which he was minister at London, until the death of Schwarzenberg recalled him to Vienna, to hold the portfolio of foreign affairs. He presided at the Vienna Conference in 1855, and represented Austria at the Congress of Paris. He died October 28, 1865.

Buonaparte. See BONAPARTE.

Buonarroti. See MICHELANGELO.

Buondelmonti. See FLORENCE (p. 786).

Buononcini, or BONONCINI, GIOVANNI MARIA (1640-78), wrote instrumental pieces, songs, and church music. His sons, Marc Antonio (1660-1726) and Giovanni Battista (1672-1750), were known as composers of operas. The latter settled in London in 1720, and for some years was very famous and popular.

Buoy, in nautical affairs, is a floating mark placed in the navigable track of vessels to indicate the existence of a sunken danger. They are made of various shapes and colours so as to indicate on which hand vessels must keep them in passing. A conference of the nautical authorities of Great Britain and Ireland resolved in 1883 to adopt a systematised scheme of buoyage. For full particulars the reader is referred to this report; but the chief conditions are as follows: Buoys showing the pointed top of a cone above water shall be called conical, and shall always be starboard-hand buoys. Buoys showing a flat top above water shall be called can, and shall always be port-hand buoys. Buoys showing a domed top above water shall be called spherical, and shall mark the ends of middle grounds. In Scotland, however, port and starboard hand buoys must be painted of a different colour. Port-hand buoys are black, and starboard-hand buoys are red. Spherical buoys are distinguished by white stripes. The starboard buoys are on the right hand when the vessel is ascending a river. On the coast the starboard-hand buoy is on the right hand when the vessel is going with the main stream of flood-tide. Wreck buoys are painted green, and marked *Wreck*. Buoy dues are levied on ships coming to ports within the jurisdiction of the several authorities which maintain the buoys.

Lighted Buoys.—River buoys are now in many cases lighted by compressed oil-gas on Pintsch's principle; the buoy is charged to a pressure of about 7 atmospheres, or 105 lb. per square inch. The buoys are surmounted by a small dioptric apparatus in which the light burns constantly. The buoys are charged once a month. The Clyde Lighthouse Trustees were the first (in 1880) to introduce these buoys in Scotland, having erected a work at Port-Glasgow for the manufacture and compression of the gas. This trust also lights the buoys of the Clyde Navigation Trust. Twelve lighted buoys have been moored in the Clyde.

Eight lighted buoys have been moored by the Trinity House in the Thames. In the United States certain buoys are lighted by electricity; others by various systems of compressed-gas burning.

The Courtenay Automatic Sounding Buoy:

a, cylinder; *b*, mooring shackles; *c*, rudder; *d*, buoy; *e*, diaphragm; *f*, ball-valves; *g*, air inlet tubes; *h*, outlet tube to whistle; *i*, compressed-air inlet to buoy; *k*, man-hole; *l*, steps; *m*, whistle.

ing of air, which by an arrangement of valves is compelled to impinge on the edge of the whistle, and thus produce a deep loud sound, heard in favourable circumstances at a distance of 5 to 7 miles. One of these buoys was in 1879 moored at the east end of Inchkeith in the Firth of Forth. A similar 'whistling buoy' is largely used in American waters.

Bell Buoy.—The bell buoy is formed as a large segment of a sphere, the flat side being uppermost. On this is erected a framework which carries a bell of about 3 to 7 cwt. The bell is a fixture, and is rung by the swinging of movable clappers. It is not nearly so efficacious as the Courtenay buoy.

For LIFE-BUOY, see that head.

Buoyancy is that quality whereby a ship, or any other floating body, is enabled to support a certain weight. In the case of a ship, it is necessary that such weight should be carried without her sinking too deeply in the water, or floating too lightly on it. The weight of a ship, not loaded with any cargo, is exactly equivalent to the weight of the volume of water she displaces (see HYDROSTATICS). Therefore, given a certain draught-line to which a ship is to be loaded, multiply the number of cubic feet of the volume of the immersed part by the weight of a cubic foot of sea-water (64 lb.), and the product will be the weight of water displaced by the ship at the given draught-line. If from this the weight of the ship herself be subtracted, the residue is the amount of extra weight, or cargo she is capable of carrying at that draught-line, and is a measure of her quality of buoyancy.

Buphaga. See BEEF-EATER.

Buprestis, a genus of beetles, typical of a large family—Buprestidae. Those occurring in warmer countries are conspicuous for lively colour and metallic sheen. Some of them are popularly known as Golden Beetles. *B. gigas*, found in Cayenne, is about 2 inches long. Some small species occur in England. The larvae bore tunnels

in wood. The adults are drawn from their hiding-places among plants by the warmth and brightness of the mid-day sun, with which their own vividness seems so markedly in harmony. The wing-cases of

Buprestis Bicolor.

Larva of *Buprestis gigas*.

some species are used to enrich the embroidery of the Indian zenana, and the joints of the legs are also strung into necklaces and bracelets.

Bur, in an engraving, is a slight ridge of metal raised on the edges of a line by the *graver* or the *dry point*. It produces an effect like a smear, and is therefore usually regarded as a defect, and scraped off. Some etchers, however, take advantage of it to deepen their shadows, and Rembrandt made use of it in this way with telling effect. As the bur soon wears off, in valuable old proofs its presence is strong evidence of the early date of an impression.

Bur. See BURDOCK, THISTLE.

Bura'no, an island and town of Northern Italy, 5 miles NE. of Venice. Vegetables are raised, and fishing employs the greater number of the inhabitants. There is a school for the designing and making of fine laces; this manufacture, once famous, then nearly extinct, having latterly been revived. Pop. of town, 4492; of commune, 6800.

Burbage, RICHARD, one of the great English actors, born most probably about 1567, the son of James Burbage, himself an actor, and the builder of the Shoreditch and Blackfriars theatres. Richard made his debut early, by 1588 having already earned some reputation, and during the next ten years outstripped all competitors, and earned the title of 'Roscius.' The death of his father in 1597 brought him a share in the Blackfriars Theatre, and in 1599, together with his brother Cuthbert, he pulled down the Shoreditch house, and built with the materials the famous Globe Theatre as a summer playhouse, while the Blackfriars was to become exclusively a winter house. For the expenses of building Burbage had to borrow money, and he took as partners in his undertaking Shakespeare, Hemming, Condell, and others. At one or other of these two theatres Burbage gained his greatest triumphs, and took the leading part in almost every new play until his death in 1619. Though short and stout in person, he played heroic tragedy with great fire and genius, and Overbury tells us of the modulations of his voice, and his 'full and significant action of body.' Richard III. was one of his most popular parts. Burbage was a not unskilful painter, and an undoubted picture of his is preserved at Dulwich College. See J. P. Collier's *History of English Dramatic Poetry* (1879).

Burbot (*Lota vulgaris*), a fish closely allied to the Ling (q.v.), and remarkable as the only fresh-water species of the Cod family (Gadidae). It is found in the Cam, the Trent, and other rivers of the eastern and midland counties of England, but is one of the most local of British fresh-water fishes. It is found also in various parts of middle

Europe, and in Asia. In English rivers, it often reaches 2 or 3 lb. in weight, but has been taken of 8 lb. weight; and in some parts of Europe, it is said to reach as much as 10 or 12 lb. In appearance, the burbot very much resembles the

Burbot.

ling, but is rather thicker at the neck, and tapers somewhat more rapidly, although still of a somewhat elongated form. It has two dorsal fins, the first short, the second very long, and a very long anal fin. It differs from the ling in the form of the tail-fin, which is oval and slightly pointed; but agrees with it in having a single barbule on the lower jaw. It is of a greenish-brown colour, clouded and spotted with darker brown on the upper parts, the under parts lighter; the scales are small; and the whole body is covered with a mucous secretion. The flesh is white, firm, and of good flavour. The burbot usually keeps to the bottom of deep water, and swims up the river at spawning times (midwinter). It can survive for a long time out of water. It is commonly taken by trimmers and night-lines, as it feeds principally during the night. Its food consists of small fishes, worms, molluscs, fish-spawn, &c. Its liver yields an oil similar to cod-liver oil. It is one of the hosts of the asexual stage of the formidable parasite, *Bothriocephalus* (q.v.).

Burckhardt, JOHN LEWIS, traveller, born at Lausanne, Switzerland, in 1784, was educated at Neuchâtel, Leipzig, and Göttingen. In 1806 he came to London with an introduction from Blumenbach to Sir Joseph Banks, the leading spirit of the African Association, who accepted his services to explore the interior of Africa; and in 1809 he embarked for Malta, having previously qualified himself for the undertaking by a study of Arabic, and also by inuring himself to hunger, thirst, and exposure. From Malta he proceeded, under the disguise of an oriental dress and name, to Aleppo, where he studied more than two years, at the end of which time he had become so proficient in the vulgar Arabic, that he could safely travel in the disguise of an oriental merchant. He visited Palmyra, Damascus, Lebanon, and other remarkable places, and in 1812 went to Cairo, his object being to proceed from thence to Fezzan, and so to the source of the Niger. No opportunity offering itself at the time for that journey, he went into Nubia, and thence in 1814 proceeded to Mecca, one of the very first Christians to perform the pilgrimage. So completely had he acquired the language and ideas of his fellow-pilgrims, that, when some question arose respecting his orthodoxy, he was thoroughly examined in the Koran, and was not only accepted as a true believer, but was highly commended as a great Moslem scholar. In 1815 he returned to Cairo, and in the following year ascended Mount Sinai. The Fezzan caravan, for which he had waited so long, was at last about to depart, and Burckhardt had made all his preparations for accompanying it, when he was carried off by dysentery at Cairo, October 15, 1817. He was buried, as a holy pilgrim, in the Moslem cemetery. His collection of oriental MSS., in 350 volumes, was left to the university of Cambridge. His journals of travel, remarkable alike for their interest and evident truthfulness, were published in 1819-30 by the African Association. They form

live works—*Travels in Nubia, in Syria, and in Arabia, Notes on the Bedouins, and Arabic Proverbs*.

Burdekin, a river of Queensland, draining the district of North Kennedy. It rises not far from the coast, and after an irregular course forms a delta emptying into Bowling Green and Upstart bays. It was discovered by Leichhardt in 1845, and explored by Dalrymple and Smith in 1859-60.

Burden, a term of law in Scotland, used to signify any restriction, limitation, or encumbrance affecting either person or property. With regard to mere personal burdens, or obligations to pay, no difficulty occurs. But if the payment of a sum of money is intended to make a real burden on land, or to be secured on land which is being conveyed, care must be taken to give the exact sum and the name of the creditor (or by reference to recorded deeds to give the means of ascertaining these), and to state distinctly (although no particular form of words is essential) that the money is to be a burden or charge on the land. Registration of such words in the Register of Sasines is essential to the validity of the burden. The creditor in a real burden can point the movables on the land, and can adjudge the land itself, and thereafter sue the tenants for rent. See the Scottish Land Title Acts of 1868 and 1874.

Burden of Proof, in legal procedure, signifies the obligation to establish by evidence certain disputed facts; and, as a general rule, this burden lies on the party asserting the affirmative of the issue to be tried or question in dispute, or on the party who would fail if no evidence were adduced on either side. Accordingly, it almost always rests on the plaintiff or pursuer in an action, or on the party asserting the facts on which the result of the litigation must depend. There may, however, be such a legal presumption in favour of the pursuer, that the burden falls on the defender. Thus, where a deed granted by a client in favour of a law-agent is impeached, the law-agent would have to prove that it was properly obtained, and afterwards confirmed by the client. And matters alleged in defence must of course be proved by the defender. Thus, in an action for infringement of patent, it is presumed, unless the defender proves the opposite, that the patent was for an original and meritorious invention. In fact, all the legal presumptions—e.g. in favour of innocence of charges of crime and fraud, in favour of the course of business having been followed, in favour of the onerosity of bills of exchange (i.e. that they were granted for value)—throw the burden of proof on the party contradicting these presumptions. A party is generally bound to prove what is peculiarly within his knowledge. The general presumption in favour of innocence is often displaced by statute for reasons of public policy, as in prosecutions under the Poaching and Post-office and Inland Revenue acts. This subject is treated by all the writers on Evidence, as Taylor, Rosecoe, and Powell in England; Dickson in Scotland; and Greenleaf in America. See also Bentham's *Rationale of Judicial Evidence*.

Burder, GEORGE, Congregationalist minister, was born in London in 1752. He studied for an artist and engraver, but in 1776 began preaching, and in 1778 was appointed pastor at Lancaster. He removed in 1783 to Coventry, and in 1803 to London. Here he became secretary to the London Missionary Society, and editor of the *Evangelical Magazine*. He died 29th May 1832. His *Village Sermons* have been translated into many languages; and he was the author of other series of sermons and publications which have had an immense circulation. See his *Life* by H. Burder (1833).

Burdett. SIR FRANCIS, Bart., the most popular English politician of his time, was born 25th January 1770. Educated at Westminster and Oxford, he spent three years (1790-93) on the Continent, and was a witness of the progress of the French Revolution. In 1793 he married Sophia, youngest daughter of Countess, the wealthy London banker; in 1796 was elected M.P. for Boroughbridge, Yorkshire, and in 1797 succeeded to the baronetcy. In the House of Commons he made himself conspicuous by his opposition to the war, and his advocacy of parliamentary reform, Catholic emancipation, freedom of speech, prison reform, and other liberal measures, most of which were afterwards carried. One of the most effective political speakers of that excited period, he for many years prominently occupied public attention, and was the idol of the London populace. His candidature for Middlesex in 1802 involved him in four years' costly and fruitless litigation; but in May 1807, in which same month he fought a duel with a Mr Paull, he was returned for Westminster, which he represented till 1837. Burdett having in 1810 published, in Cobbett's *Political Register*, a Letter to his Constituents, declaring the conduct of the House of Commons illegal in imprisoning a radical orator, the Speaker's warrant was issued for his apprehension, as being guilty of a breach of privilege. For two days he barricaded his house; the populace supported him in his resistance, and in a street contest between them and the military one life was lost; but after two days an entry was forced, and Burdett conveyed to the Tower. The prorogation restored him to liberty. In 1820 a letter on the 'Peterloo massacre' involved him in three months' imprisonment and a fine of £1000. In 1835 he joined the Conservatives; in 1837 was returned for Wiltshire, which he represented till his death, on 23d January 1844.

Burdett-Countess. THE RIGHT HON. ANGELA GEORGINA, BARONESS, daughter of Sir Francis Burdett, was born 21st April 1814. In 1837 she inherited much of the property of her grandfather, Thomas Countess, the banker, on the death of his widow, Miss Mellon the actress once, now Duchess of St Albans. The liberal and philanthropic use she made of this wealth, in her efforts to mitigate the sufferings of her fellow-creatures and of the lower animals, has rendered her name well known and deservedly popular. Besides spending large sums of money in building and endowing several churches and schools, she endowed the three colonial bishoprics of Cape Town, Adelaide, and British Columbia, founded an establishment in South Australia for the improvement of the aborigines, got up the Turkish Compassionate Fund (1877), and established a fishery school at the Irish village of Baltimore (1887). In her zeal for the good of her own sex, she effected important reforms in the teaching of girls at the National Schools, and established a shelter and reformatory for fallen women. To the city of London she presented, besides several handsome fountains, the Columbia Market, Bethnal Green (1870), for the supply of fish in a poor district; she also built Columbia Square, consisting of model dwellings at low rents, for about 300 families; and the People's Palace owes much to her generosity. A lively interest in emigration led her from time to time to assist many poor families in their passage and outfit. Her private charities have been on a corresponding scale; and she is also a liberal patroness of art. In 1871 she accepted a peerage from government. In 1872 the freedom of the city of London was conferred upon her, in 1874 that also of Edinburgh. In 1881 she was married to Mr William Ashmead-Bartlett (born 1846), who in 1882 obtained the royal license to assume her name, and

who, in 1885, was elected Conservative member for Westminster.

Burdock (*Arctium*), a genus of Compositæ (q.v.), familiarly characterised by the bracts of the involucre which are hooked inwards at the point. By means of these hooks, the flower-head, popularly called a *bur*, readily lays hold of the clothes of a passer-by, the wool of a sheep, or the like, and thus the fruitlets are transported from one place to

Greater Burdock (*Arctium Lappa*, var. *majus*):
a, section of flower-head, showing hooked bracts.

another, the short hairy pappus being insufficient to waft them far on the wind. The Common Burdock (*A. Lappa*) is consequently of wide distribution throughout the north temperate zone, and has numerous varieties or sub-species; it is very common in the United States. It flowers in July and August. The root was formerly used in medicine, and the young shoots for culinary purposes, for which it has even attained cultivation in Japan.

Bureau, a French word signifying a writing-table or desk; also an office for transacting business, a department of government, or the officials that carry it on. In the United States, it is also used in the latter sense; but is universally the word for a chest of drawers.—**BUREAUCRACY** is a name often given to signify the kind of government where the administration is centralised in regularly graded series of government officials, who are responsible only to their chiefs, and who interfere with and control every detail of public and private life.

Burg, a town of Prussian Saxony, on the Ihle Canal, 15 miles N.E. of Magdeburg by rail. It has busy manufactures of woollens, pottery, leather, and tobacco, besides dye-works, foundries, &c. Pop. 15,572.

Burgage Tenure is the name of two different tenures of land, one in England, the other in Scotland. In England, it is a species of free *Socage* (q.v.) holding, and it prevails where the king or other person is lord of an ancient borough in which the tenements are held by a certain and determinate rent, and subject to a variety of customs, the principal and most remarkable of which is that called *Borough English* (q.v.). Among the other customs was one that the wife shall be endowed with all her husband's tenements, and not with the third part only, as at common law.

In Scotland, by this tenure is meant a peculiar sort of military holding affecting property in royal

burghs, the sovereign being superior or overlord, and each individual proprietor or burghess holding direct of the crown, for the *reddendo* or service of *Watching and Warding*. This service is otherwise termed 'service of burgh used and wont,' and is now merely nominal. The proper vassal of the crown is the whole community; hence the tenure was not subject to the incidents of non-entry and relief, and the burghesses enjoyed peculiar facilities in the completion of titles by heirs and purchasers through the intervention of the magistrates. Since the conveyancing legislation of 1868 and 1874, however, there is not for practical purposes much difference between burghage and the ordinary feu-holdings in Scotland. At one time no widow's terce was due from burghage lands, but this was altered by the Conjugal Rights Act, 1861.

Burgas, a port of Eastern Roumelia, on the Gulf of Burgas, in the Black Sea, 76 miles N.E. of Adrianople. It has a trade in agricultural produce, and sends large quantities of clay to the Turkish pipe-makers. Pop. about 5800.

Burgdorf (Fr. *Berthoud*), a Swiss town, 14 miles N.E. of Bern by rail, with manufactures of silk, linen, and colours. In the old castle here Pestalozzi established his famous school (1798-1804). Pop. 6875.

Bürger, GOTTFRIED AUGUST, German lyric poet, was born 31st December 1747, at Molmerswende, near Halberstadt, the son of the Lutheran pastor. In boyhood he displayed no inclination to study, and Latin he especially abhorred; but he showed at the same time a relish for verse, though his only model was the hymn-book. He was educated at Aschersleben and Halle, where in 1764 he began to study theology; but in 1768 he migrated to Göttingen, and entered on a course of jurisprudence. His life here was wild and extravagant, and he might have sunk into obscurity, if the intimacy which he happily formed with Voss, the two Stolbergs, and others of that youthful poet band, had not stirred up his better nature, and inspired him with an ambition to excel. He studied closely the ancient and modern classics; Shakespeare and Percy's *Reliques* had the strongest influence of all. As to his poems, chiefly ballads and songs, even German critics, such as Schiller, Gervinus, and Vilmar, differ widely in their opinions; but all agree in praising the clear, strong versification of *Lenore*, the *Wild Huntsman*, and other of his ballads. As Percy's *Reliques* had inspired Bürger, so Bürger in turn inspired Sir Walter Scott, whose earliest production was a translation of *Lenore*. Bürger's life was spent in great poverty and misery, the result partly of misfortune, and partly of his own sin. Thrice he married, and thrice unhappily—first in 1774, Dora Leonhart; next in 1785, her sister Auguste, the 'Molly' of his poems, who had borne him a son in Dora's lifetime; and lastly, in 1790, his 'Swabian maiden,' Elise Hahn, whom he divorced in 1792. Unfortunate speculations involved him in embarrassment; and, favourite poet though he was of the German nation, he was left to earn his bread by translations and similar hack-work. He died at Göttingen, 8th June 1794. Of his poems, the first collection of which appeared in 1778, there have been numerous editions, the best being Reinhard's (4 vols. 1796-98), Tittmann's (1869), Grisebach's (2 vols. 1873), and Sauer's (1884). See his *Life* by Döring (1826) and Pröhle (1856), and his *Letters* (5 vols. 1802-74).

Burgess, or **BERGHER**, from the same origin as borough, means, when taken in a general sense, the inhabitant of a burgh, or much the same thing as the word citizen, but has a variety of special meanings, according to local institutions. In almost all parts of Europe, when used in a technical

sense, the word means a person who holds some peculiar privilege in a town or municipal corporation. The burghesses of the towns of southern Europe were, and still nominally are, an interesting relic of ancient Roman institutions, existing in contest and rivalry with the institutions of feudality. The burghess is virtually the *civis* or citizen of the Roman municipality, with a different name. The European monarchs frequently found it their interest to support the burghesses, as a check on the influence of the feudal aristocracy; and thus was nourished the great system of city communities, which have exercised so important an influence on the fate of the world. See MUNICIPALITY.

In the law of England, a burghess is a member of the corporation of a corporate town, or he may be described as a freeman duly admitted as a member of the corporate body. This privilege was, and to some extent still is, acquired by birth or apprenticeship—that is, by being born of a freeman, or by apprenticeship for seven years within the borough to a freeman. It might also be obtained by gift or purchase. The Municipal Corporation Act of 1835, while abolishing the last-mentioned mode of admission by gift or purchase, expressly reserved the rights of freemen and their families; and it also provided for the making up and preservation of a list of burghesses so admitted, to be called the *Freeman's Roll* (q.v.). As the law at present stands under the Municipal Corporations Act, 1882, a burghess (and this includes females) is a person of full age who has occupied a house or other building, and has resided for one year in a borough, and has paid poor and borough rates, and as such has been enrolled in the Burgess Roll (45 and 46 Vict. chap. 50). See BOROUGH, TOWN-COUNCIL.

In the Scots law, the definition of burghess is very similar to the English one above mentioned. But there was this distinction, that a person could always be admitted to the privilege by *election of the magistrates of the burgh*—the burghesses taking, on the occasion of their admission, a quaint form of oath, in which they profess the religion of the country, and loyalty to the sovereign and to the provost and bailies of the burgh and their officers, and declare, *inter alia*, that they will 'make concord where discord is, to the utmost of their power.' On taking this oath, and paying the customary dues of admission, the burghess obtained an extract of the act of his admission from the town-clerk. One of the peculiar privileges of a burghess in Scotland—viz. that of his heir having a right of succession to *heirship movables*, was abolished by the Titles to Land (Scotland) Act, 1868. The admission of burghesses is now regulated by the Act 23 and 24 Vict. chap. 47, which applies to royal burghs, as amended by 39 Vict. chap. 12, which applies to both royal and parliamentary burghs. The last-mentioned statute was intended to assimilate the law of Scotland to some extent to that of England as regards the creation of burghesses. It provided that every person is a burghess who is of full age and who has occupied property within any burgh for a period of three years prior to any term of Whitsunday after 1876, and who during the term of such occupation has been an inhabitant householder within the burgh, and who has paid poor-rates during the period of such occupancy. A female may become a burghess, but not an alien or one who has within 12 months immediately previous to the last term of Whitsunday of the period of his occupation received parochial relief or any charitable allowance.

BURGESS LIST and **BURGESS ROLL** are lists made under the provisions of the Municipal Corporation Act of 1835, as amended by 20 and 21

Vict. chap. 50, and 32 and 33 Vict. chap. 55. The overseers of the poor of every parish wholly or in part within any borough are directed to make out an alphabetical list, called 'The Burgess List,' of all persons who may be entitled or qualified to be enrolled on the burgess roll of that year, such list to be printed and made public. This list is afterwards revised by the revising barrister, and the names of those persons allowed, on revision, to remain are then transferred to the *Burgess Roll*, which is copied into a general alphabetical list in a book provided for that purpose by the town-clerk or clerk of the peace, and which book must be completed on or before the 22d of October in every year; every such book being the burgess roll of the burgesses entitled to vote for councillors, assessors, and auditors of the borough. Copies of such burgess roll, so completed, shall be made in writing, or printed for sale.

In Scotland, the list corresponding to the English burgess roll is the Register of Municipal Electors; the 'roll of burgesses' in Scotland being quite different. It is the custom for the magistrates of the more important cities and towns of the United Kingdom to admit persons of distinction, whether residents or strangers, to the position of honorary burgesses, by 'presenting the freedom of the city.' If strangers, such honorary burgesses cannot exercise the municipal franchise or be inducted to the town-council. In 1899, both in Scotland and England, women who had deserved well of the republic were made honorary burgesses.

Burgess, JOHN BAGNOLD (1830-97), a painter especially of Spanish subjects, born at Chelsea, became A.R.A. in 1877, and R.A. in 1889.

Burgh. See BOROUGH.

Burgh, HUBERT DE, from 1215 to 1232 was the patriotic Justiciar of England, for the last four years the virtual ruler of the realm, but now is chiefly remembered as the jailer of Prince Arthur (q.v.). He was created Earl of Kent in 1227, and died at Banstead, Surrey, 12th May 1243. Walter de Burgh, Earl of Ulster, who died at Galway in 1291, was his grand-nephew.

Burghers. See UNITED PRESBYTERIAN.

Burghley, WILLIAM CECIL, LORD, one of England's greatest statesmen, was born at Bourn, Lincolnshire, his grandfather's seat, 13th September 1520. His father, Richard Cecil of Burghley, Northamptonshire, rose high in favour with Henry VIII., and left large estates at his death in 1552. Educated at the grammar-schools of Stamford and Grantham, young Cecil thence passed in 1535 to St John's College, Cambridge, where he was remarkable alike for his diligence and aptitude in learning, but where he formed an imprudent attachment for a wine-seller's daughter, Mary Cheke, the sister of the great Greek scholar. They were married in 1541, two months after his entering Gray's Inn, but she died three years later, leaving him one son. At Gray's Inn he devoted himself assiduously to the study of law. History, genealogy, and theology also formed part of his studies at this time; and his knowledge of the last recommended him to the notice of Henry VIII., who in 1547 presented him with the valuable office of *custos brevium*. His second marriage (1545), to the daughter of Sir Anthony Cooke, procured him the patronage of the Protector Somerset, who in 1547 made him Master of Requests, and in the following year his secretary. He shared in Somerset's disgrace, even to two months' imprisonment in the Tower; but in 1550 his pre-eminent abilities secured for him the post of secretary of state, and in 1551 the honour of knighthood. During his second secretaryship,

Cecil effected most important and beneficial changes in the commercial policy of the country. With a sagacity far beyond the spirit of his age, he endeavoured to throw trade open, and did succeed in abolishing some monopolies; but others proved too strong for him, standing as he did alone, at a time when exclusive privileges were considered the only sureties of a profitable trade. During Mary's reign he conformed to Catholicism, and was one of Pole's escort from Brussels to England, but to him was mainly owing the rejection of the bill introduced into parliament to confiscate the estates of Protestant refugees. Prior to Mary's death, he had entered into correspondence with Elizabeth, who, on her accession to the throne (1558), at once recognising Cecil's capacity for government, appointed him chief secretary of state. A life of Cecil from this time until his death would be a forty years' history of England, when England was greatest, seeing that he was alike the originator and director of that policy which made Elizabeth's reign memorable above that of any other English sovereign. For although Elizabeth, in occasional caprice, might favour other courtiers, Burghley was the statesman whose judgment she relied on in all matters of consequence. His policy at home and abroad was at once shrewd and cautious, liberal and comprehensive, while he displayed a power of decision, ready and stern, when necessity demanded. As a statesman, he was above animosities and favouritism; his enemies never suffered, and his friends profited nothing, by his power. Capacity, truth, and honour were what he sought in public men. Had he been less just, history might have been more generous to his memory, whose darkest blot is his employment of a whole army of spies. The queen created him Baron Burghley in 1571, and conferred on him the Order of the Garter in the succeeding year, when he was also made lord high treasurer, an office he held till his death. His emoluments were as nothing to his expenditure, which was especially lavish in the building and beautifying of his stately mansions—Burghley, Theobalds in Herts, and Cecil House in the Strand. He died at the last of these on 4th August 1598, and was buried in Westminster Abbey. From his first-born, Thomas (1542-1622), created Earl of Exeter in 1605, was descended Henry, eighth earl (1754-1804), who in 1801 was made Marquis of Exeter, and whose marriage, as 'John Jones' in 1790, three years before his accession to the earldom, to a Shropshire maiden, Sarah Hoggins (1773-97), forms the theme of Tennyson's 'Lord of Burleigh.' From the second son, Robert (1563-1612), created Earl of Salisbury in 1605, came James, seventh earl, who was raised to the Marquisate of Salisbury in 1789.

See the *Memoirs of Lord Burghley* by Nares (3 vols. 1828-31), the Life by Martin Hume (1898), and works cited at ELIZABETH.

Burgkmair, HANS, a noted old German painter and wood-engraver, was born at Augsburg in 1473, and died there in 1531. He was the father-in-law of the elder Holbein and the friend of Albert Dürer, whose influence is manifest in his works. Several excellent paintings by Burgkmair are preserved in the galleries of Munich, Berlin, Augsburg, and Vienna; but he is best known as a wood-engraver, his cuts amounting in all to nearly 700. Among the most celebrated of these is his 'Triumph of the Emperor Maximilian,' in 135 cuts, with a description by the emperor (see MAXIMILIAN); and *Weisskunig*, another fine series of 237 cuts.

Burglary (an Old Fr. law term, made up of *bourg*, 'a town,' and *lèves*, 'a robber,' from Lat. *latro*), in the criminal law of England, is defined to

be a breaking and entering a dwelling-house by night, with intent to commit some felony therein, whether such intent be executed or not. By the Consolidation Act, 1861, night is defined as extending from 9 p.m. to 6 a.m. House means a permanent building in which the owner, or the tenant, or any member of the family habitually sleeps at night. A building may be constructed in several parts without internal communication so as to constitute separate houses, but outhouses, at least, where there is communication either immediate or by means of a covered or inclosed passage, are regarded as part of the dwelling-house. Occasional residence is sufficient, but not the mere sleeping of a caretaker in a house not otherwise used as a residence. Burglary thus corresponds to the ancient *hamsocna* or *hamfare* of the Anglo-Saxon law, which did not adopt, as was elsewhere done, a distinction depending on the number of house-breakers. The punishment was formerly capital, but since 1837 the maximum punishment is penal servitude for life, and not less than five years' penal servitude, or two years' imprisonment. This punishment may also be inflicted in the case of breaking into a place of worship and committing a felony there, although by day. As regards similar offences during the day, and in buildings not dwelling-houses, see **HOUSEBREAKING**. Neither the name Burglary, nor the legal distinction, is known to the Scottish law, although housebreaking by night is generally reckoned a more serious affair than housebreaking by day.

In the United States, burglary is punished by state laws, but the common law is generally followed. Some states include breaking into shops, offices, warehouses, factories, and meeting-houses as burglary. An act by congress of 1825 expressly includes breaking into boats and vessels with intent to commit a felony. In some states the same deed done in the daytime is defined as burglary in the second degree. The night is the time between one hour after sunset and one hour before sunrise, or when the features of a man cannot be clearly discerned. In the United States, burglary is never punished by penal servitude for life.

Bürglen, a village of Switzerland, in the canton of Uri, about a mile from Altorf, is the traditional birthplace of William Tell. The supposed site of the patriot's house is now occupied by a chapel, erected in 1522, upon the walls of which are represented certain well-known scenes from his history. Pop. 1478.

Burgomaster, a kind of Gull (q.v.).

Burgomaster, the Anglicised form of the Dutch *burgemeester* (German *bürgermeister*), the title of the chief-magistrate of a city or town, analogous to the French *mair*, the English *mayor*, and the Scotch *provost*.

Burgos, a city of Spain, the ancient capital of the kingdom of Old Castile, stands on the right bank of the river Arlanzon, 225 miles N. of Madrid by rail. Burgos, which is the see of an archbishop, was founded in 884. Many of the gloomy old houses of its early history still remain. In the castle, Edward I. of England was espoused to Eleanor of Castile. The cathedral, founded in 1221, ranks with those of Toledo and Leon, the three great Spanish churches of the Early Pointed period. 'Better known than either of the others,' says Mr Street, 'Burgos is inferior in scale and interest, and its character has been much altered by added works more or less Rococo in character, so that it is only by analysis and investigation that the 13th-century church is still seen under and behind the more modern excrescences.' Still, it is a glorious building, with its twin-spired western façade, its exquisite lantern, and its fifteen chapels

so rich in fine sculpture and tombs, of which there are upwards of 60, with 44 altars and fully 100 full-length statues. The church of Agueda is associated with the legend of the Cid; that of San Esteban was formerly a convent. The chief street is the Espolon, which forms a promenade by the river. The town-hall is a modern building. There are several convents in the neighbourhood. The suburbs are connected with the older part of the town by three stone bridges. Burgos was the birthplace of the Cid (q.v.), whose bones are preserved at the town-hall, as also those of Pedro the Cruel, San Julian, and San Lesme.

Burgos Cathedral.

It has manufactures of woollens and linens, and some traffic as a mart of agricultural produce. It has several hospitals and educational institutions; the university founded in 1550 is now extinct, but there is an *institute* and seminaries for priests and teachers. The city formerly had a much larger population—as many as 50,000—but on the removal of the court to Madrid in the 16th century, it began to decline in population and importance. It was further greatly injured in November 1808 by the French, who sacked it. In 1812 the city was four times unsuccessfully besieged by Wellington, who, however, took it in the following year, when the French blew it up, as well as the fortifications. Pop. 34,325.—The province of Burgos has an area of 5651 sq. m., and a population of 338,551. The surface is elevated, the soil fertile, yielding grain and fruits. The hills afford rich pasturage; and gold, silver, iron, lead, and copper are found.

Burgoyne, JOHN, British general and dramatist, was born in 1723, and entered the army in 1740. He eloped three years later with a daughter of the Earl of Derby, resided nine years in France (1747–56), and then resuming active service, distinguished himself in Portugal by the capture of Alcantara (1762). Several years followed of fashionable life, during which he sat in parliament as a Tory, till in 1774 he was sent out to America, and in the summer of 1777 led an expedition

from Canada into the rebellious districts. On 6th July he took Ticonderoga; but on 17th October, after two engagements, his retreat cut off, and his ammunition exhausted, he found himself forced to surrender to General Gates at Saratoga (q.v.). The British and American armies at the time of the capitulation are estimated by American writers at 5804 and 10,817; by English, at 3500 and 20,000. On his return to England he lost all his appointments, and went over to the Whigs, who, when in 1782 they came into power, made him commander-in-chief in Ireland. This office he held eighteen months, and subsequently devoted himself to light literature. He was the author of some pamphlets in defence of his conduct, of *The Maid of the Oaks* (1775), and of *The Heiress* (1786), a most successful comedy. In 1787 he was one of the managers for conducting the impeachment of Warren Hastings; and he died on 3d June 1792. See his *Life* by E. B. de Fonblanque (1876).

Burgoyne. SIR JOHN FOX, Bart., engineer officer, a natural son of the above, was born in 1782. After three years at Eton (where he was Hallam's fag) and two at Woolwich, he entered the Royal Engineers in 1798; from 1800 to 1807 served in the Mediterranean; was with Moore at Corunna in 1809; and served under Wellington through all the Peninsular war, well earning the K.C.B., which he did not, however, receive till 1838. In 1814 he was commanding engineer of the expedition to New Orleans, and in 1826 of Clinton's to Portugal. In the Crimean war he was chief of the engineering department of the British army; but the discovery that Sebastopol could not be taken off-hand led, in February 1855, to his unjust recall. However, he was made a baronet in 1856, constable of the Tower in 1865, and a field-marshal in 1868, besides receiving many more marks of honour. He died 7th October 1871. See his *Life* by Colonel Wrottesley (2 vols. 1873).

Burgundy, once an independent kingdom of wide extent, and later a French province (Fr. *Bourgogne*). The ancient Burgundians (*Burgundii* or *Burgundiones*) were originally a German tribe settled on the banks of the Oder and the Vistula, who afterwards extended themselves to the Rhine and the Neckar, and in 406 penetrated into Roman Gaul. In 437 they sustained a defeat from the Huns, and placed themselves under the supremacy of the Romans, by whom they were settled in the modern Savoy. From their seat there they extended their dominion in the confusion attendant on the downfall of the Roman empire till it embraced nearly the whole Rhone valley, with the exception of Provence. Their conversion to Christianity took place in the course of eight days! They adopted a brief Arian confession of faith, and were baptised. The Burgundian kingdom was, however, unable to maintain itself against the Franks, and in 534 it was conquered by that people.

The weak government of the later Carolingian kings allowed Burgundy once more to assert an independent existence under Boso of Vienne in 832. Boso's realm, known as Cisjuran Burgundy, or, from its capital, the kingdom of Arelate (Arles), lay mainly in the basin of the Rhone. A second Burgundian state arose about the same time in the country between the Saone and the Reuss, and was known as Transjuran or Upper Burgundy. These states, united in 930, were for a time powerful and famous; but in 1038, on the extinction of the royal dynasty, Burgundy became part of the German empire, and continued to form a part of it for nearly three centuries. It was afterwards broken into several fragments, nearly all of which were gradually absorbed by France.

In mediæval times the name of Burgundy is better known as associated with the dukedom founded by Richard, Count of Autun, a brother of the Boso above mentioned. The nucleus of the dukedom was in Lower Burgundy, the region which afterwards became the French province of Burgundy, to the north and west of the other Burgundian realms. Its brilliant period began when John of France in 1363 conferred the dukedom on his son Philip the Bold. By his marriage with Margaret, heiress of the Count of Flanders, Philip added to his dukedom a great part of the Low Countries, and was appointed regent of France during the insanity of Charles VI. of France. The quarrels of the rival dukes of Burgundy and Orleans at this period, and during the English invasions of Henry V., made a great noise in France, and were most fatal to its prosperity. In 1435 their feuds were arranged by the treaty of Arras, which led to great increase in the possessions of Burgundy. Charles the Bold (1467-77) was one of the most powerful princes in Christendom, and had a gorgeous court. The possession of the flourishing cities of Flanders made him the wealthiest monarch of Europe, and by this time the House of Burgundy had acquired almost the entire Netherlands. His power was shattered by the victories of the Swiss at Granson and Murten, and he was slain at Nancy (1477). After that Burgundy no longer played a great rôle as an independent state. Louis XI. of France, as overlord, appropriated the dukedom. Mary, daughter and heiress of Charles, marrying Maximilian of Austria, transferred to that house the rest of her dominions; and they passed to Maximilian's grandson, the emperor Charles V. The final result was, that the domains of Burgundy properly so called were incorporated with France, while its possessions in the Low Countries remained with the House of Hapsburg. The portion of Burgundy that fell to the Hapsburgs, together with the seventeen provinces of the Netherlands, formed, from 1512 till the rebellion of the Netherlands, one of the ten 'circles' of the German empire. Ultimately they went to constitute modern Belgium. See CHARLES THE BOLD, HOLLAND, PHILIP THE BOLD, PHILIP THE GOOD.—A later Duke of Burgundy (1682-1712), grandson of Louis XIV. of France, is known as the unworthy pupil of the great Fénélon.

The *county* of Burgundy corresponded to Franche-Comté (q.v.). The French *province* of Burgundy, as constituted in 1477, comprised what are now the departments of Ain, Côte-d'Or, Saône-et-Loire, and Yonne, with parts of adjoining departments; and among its towns were Dijon, Macon, Autun, Châlon-sur-Saône, and Bourg.

See also FRANCHE COMTÉ; Dubois, *La Bourgogne depuis son Origine* (2 vols. 1867).

Burgundy Pitch, a resinous substance prepared from common Frankincense (q.v.), the spontaneous exudation of the Norway spruce-fir (*Abies excelsa*; see FIR) by melting it in hot water, by which means it is freed from a considerable part of the volatile oil which it contains. By straining it through a coarse cloth, impurities are also removed. Burgundy pitch is of a yellowish-white colour, hard and brittle when cold, but softening by the heat of the hand, and readily adhering to the skin. It has a not unpleasant resinous odour, and when pure, no bitter taste. It is used in medicine as an external application only, and generally acts as a mild irritant. A very common application of it is as a plaster in complaints of the chest, and in rheumatic complaints. It enters also as an ingredient with resin, oils, &c., into a compound plaster of similar use. The Burgundy pitch of commerce is now principally brought from Finland, Austria, and Switzerland; but the greater

part of what is sold under that name is made by melting together pitch, rosin, and turpentine, and agitating with water, thereby imparting to it the necessary yellowish colour. This imitation may be distinguished from the genuine Burgundy pitch by its bitter taste, less agreeable odour, and by its not being soluble in twice its weight of glacial acetic acid.

Burgundy Wines are chiefly the produce of vineyards cultivated on the hilly lands forming the Côte-d'Or, and rank amongst the finest in the world. The wines of Upper Burgundy, and the wines of Lower Burgundy (Yonne), Macon, and Beaunois, are other two groups of Burgundies. The finest of the *white* Burgundy is Mont Rachet; Chablis is a *white* wine of Lower Burgundy. Beaune is the centre of the trade. The most celebrated of the *red* wines of Burgundy are Romanée-Conti, Chambertin, Richebourg, Clos-Vougeot.

Burhanpur, a town of India, in Nimar district, Central Provinces, on the north bank of the Tapti, 280 miles NE. of Bombay, and 2 from the railway station of Lalbāgh. The remains of buildings show that the town extended over an area of 5 sq. m. when under the Moguls. Eight sets of aqueducts can still be traced. The city was taken by General Wellesley in 1803, but it was only in 1860 that Burhanpur came completely under control of the British government. The town contains a palace built by Akbar, and a mosque built by Aurangzeb. Although on the decline, there are still some manufactures of cotton and of muslin, silk, and brocade, for which the place was formerly notable. Pop. 32,252.

Burial, a word of Teutonic origin (A.S. *byrgan*, 'to bury'), is applied to the prevalent method among civilised nations of disposing of the dead by committing them to the earth. The general tendency of mankind has always been to bury the dead out of sight of the living; and various as the methods of accomplishing this end have been, they have resolved themselves into three great classifications: (1) The simple closing up of the body in earth or stone; (2) the burning of the body, and the entombing of the cinders; and (3) the embalming of the body. The first of these is the earliest form of which we have any knowledge. The palæolithic cave-dwellers of France and Belgium buried their dead in natural grottos and crevices of the rocks similar to those in which they lived. The later stone-age people throughout Europe buried in chambered barrows and cairns. The bronze-age people buried in unchambered barrows, or in cemeteries of stone cists set in the ground, often in natural eminences of sand or gravel, or surrounded by circles of standing stones. Cremation was practised side by side with simple inhumation throughout the prehistoric period. It was also a general characteristic of burial in pagan times that the dead, whether cremated or not, were provided with grave-goods, such as urns or vessels of clay, bronze, gold, or glass, clothing and personal ornaments, implements, and weapons. Christianity abolished cremation, and restricted the provision of grave-goods to the burial of kings and priests, who continued to be interred in their royal and sacerdotal robes, and with their insignia of office. The stone cist became the stone-lined grave of the early Christian cemeteries, and the stone sarcophagus, which can be traced back to the time of the Egyptian kings who built the Pyramids, continued throughout the middle ages. In the first four centuries of the Christian era the Christians at Rome had buried their dead in the Catacombs, a series of subterranean excavations, consisting of long horizontal passages, with recesses on either side, arranged in tiers, for the reception of the

bodies, closed in by slabs bearing inscribed memorials and emblems of the faith. During the persecutions of the 2d century the Catacombs were used as places of assembly for worship; and the association of the church and the cemetery thus established has continued ever since. It was not till the 9th century, however, that the formal consecration of churchyards became customary. In Egypt, and perhaps also in Palestine, the Christian church inherited the practice of embalming, to which there is frequent allusion in the Scriptures. The Israelites may have learned the art from the Egyptians, among whom it was so extensively practised, that Egyptian corpses, as inoffensive as any article of wood or stone, are scattered over Europe in museums, and are even to be found as curiosities in private houses. The soil and climate of Upper Egypt seem to have afforded facilities for embalming unmatched in any other part of the world; and in other places the vestiges of the practice are comparatively rare, though it is not unusual even yet to embalm royal corpses, and in some places to preserve a series of desiccated bodies, as in the vault of the monastery of Kreuzberg, at Bonn, where the monks have been successively preserved in their costume for centuries. Cremation is described in the Homeric poems as an honourable mode of sepulture practised in the heroic ages of Greece. The Romans, who in the time of the Republic had interred their dead, adopted the Grecian usage in the days of Sulla. It is mentioned in the Sagas as the older custom of the early Norsemen, who used occasionally to place the viking in his ship, and 'send him flaming out to sea,' instead of entombing him beneath the mound of earth, with all his belongings, in his vessel set on even keel, which was the more usual method. The Esthonians also practised cremation; and the custom was retained till the 10th century among the tribes along the Volga, along with the horrible accompaniment of human sacrifice in honour of the dead, as we learn from the narrative of Ahmed Ibn Fozlan, who states that he was an eye-witness of the whole ceremonies. It was prohibited among the conquered Saxons, under pain of death, by Charlemagne. It is still practised in India, but without the suttee, or burning of the living widow with the corpse of the husband. Until quite recently cremation was a common custom in Japan, and was practised side by side with unburned interment. The latter has been the universal custom in Europe from the several dates of the introduction of Christianity into the different countries.

Some of the grandest buildings in the world have been tombs; such are the Pyramids, the castle of St Angelo, the tomb of Cecilia Metella, and many temples in eastern countries. The notion that the dead may require the things they have been fond of in life has also preserved to the existing world many relics of the customs of past ages; the tombs of Egypt have supplied an immense quantity of them, which have taught the present age more of the manners of ancient nations than all the learned books that have been written. Herodotus tells us of favourite horses and slaves sacrificed at the holocaust of the dead chief. The same thing has been done in our own day in Ashanti.

Amongst the ancients an unburned or unburied body was held to be disgraced, and the spirit was unhappy till a kindly stranger at least threw a few handfuls of earth on the corpse. In the Christian countries, too, the denial of the rite of Christian burial involved a judgment on the life of the deceased; this sad fate was usually or frequently reserved for the unbaptised, including unbaptised infants, non-Catholics, excommunicated persons, notorious mockers at religion and evil livers, unrepentant sinners, persons who did not take the

Eucharist at least once a year, executed criminals, suicides, persons who fell in duels; and till the Revolution every French stage-player had to be content with burial in unconsecrated ground. Thus in 1730 the brilliant actress, Adrienne Lecouvreur, had for this reason alone to be buried in unconsecrated ground without the semblance of a religious rite, in spite of strong pressure brought to bear on the Archbishop of Paris.

In England, burial in some part of the parish churchyard is a common-law rite, which may be enforced by mandamus—that is, every person may be buried in the parish where he dies. But the body of a parishioner cannot be interred in a metal coffin or vault, or even in any particular part of a churchyard, as, for instance, the family vault, without an additional fee. By the canons of the Church of England, clergymen cannot refuse or delay to bury any corpse that is brought to the church or churchyard; on the other hand, a conspiracy to prevent a burial is an indictable offence. It is a popular error that a creditor can arrest or detain the body of a deceased debtor; and the doing such an act is indictable as a misdemeanour. It is also an error that permitting a funeral procession to pass over private grounds creates a public right of way. By Acts of 1823, the inhabitants of any parish, township, or place, when going to or returning from attending funerals of persons in England who have died and are to be buried there, were exempted from any toll within these limits; and in 1824 the same regulation was extended to Scotland; the only difference being, that in the latter case the limitation of the district is described by the word *parish* alone. Not till 1823 was the barbarous mode of burying suicides at cross roads, with a stake driven through the body, abolished. It was then enacted that their burial should take place, without any marks of ignominy, privately in the parish churchyard, between the hours of nine and twelve at night, under the direction of the coroner. In Scotland, the right of burial in a churchyard is an incident of property in the parish; but it is a mere right of burial, and there is not necessarily any corresponding ownership in the *solum* or ground of the churchyard. Registration (q.v.) of death should precede burial. The solemn rites of burial at sea are regulated by the necessities of the case. Usually the dead body is sewn up in a hammock, with a weight attached to the feet, and a modified form of the English burial service is read before the body is committed to the deep.

At various times, and in various places, there has been much popular excitement as to the possibility or probability of persons being buried in a state of suspended animation, but still really alive. Few of the many stories of cases of this kind have been authenticated; if any such occurs, it must be the result of inextinguishable haste and carelessness. A competent medical man can easily decide by auscultation whether the heart has ceased to beat. (For the other signs of death, see DEATH, CATALEPSY.) In some places the dead are kept for a time in mortuary houses specially fitted up for the purpose—a bell-pull being attached to the extremities of the corpse, so as to give a summons on the smallest motion of the body. But these precautions have always proved needless; a corpse has never revived under such circumstances.

In Christian countries, if the remains of the saint to whom a church was dedicated could be obtained, they were buried near the altar in the choir. It became a prevalent desire to be buried near these saints, and the bodies of men eminent for their piety, or high in rank, came thus to be buried in churches. It can scarcely be said that a practice so detrimental to the public health as the burial

within churches, was checked in this country until the whole system of intramural interment, including the practice of pit burial, as it was called, was attacked by Southwood Smith, Walker, Chadwick, and other sanitary reformers. Measures were afterwards carried for shutting graveyards in crowded cities, and placing interments in open cemeteries under sanitary control. The first great measure was passed in 1850, when the Board of Health was made a Burial Board for the metropolis, and power was given to the Privy-council to close the city graveyards. The act was extended to the English provinces in 1853, and to Scotland in 1855, and has been repeatedly amended.

The main features of burial legislation are these: The Privy-council may, on the representation of the Home Secretary, order the discontinuance of burial in any graveyard, and may interfere to prevent any vault or place of burial becoming dangerous to health. They may also regulate burials in cemeteries established under statute. Licenses may be got for the continued use of private vaults and graves. The Privy-council may also require the vestry in an English parish to meet and consider whether a new burial-ground shall be provided. If they proceed, a burial board of from three to nine persons is appointed by the vestry. Town-councils in boroughs, and local boards of health, may be constituted burial boards by order in council. Parishes may combine for this purpose, and the burial-ground need not be within the parish. It must not be within 100 yards of any dwelling-house, without the consent of the owner in writing. Part of the burial-ground must be consecrated, part unconsecrated; but the fees, which are subject to public control, must be the same in both parts. The boards are authorised to arrange for the conveyance of the dead, and to provide reception-houses. They are also bound to keep accurate registers of interments. Any expenses beyond receipts are charged on the poor-rate. In 1872 very valuable suggestions for providing and managing burial-grounds were issued by the Home Secretary. These deal with situation, soil and drainage, paths, fencing and planting, size of grave spaces (which should be 9 feet by 4 feet, or 4 square yards, with a depth of from 4 to 6 feet), reopening of graves, which is permitted after 14 years, &c. The controlling authority in such matters in England as in Scotland is the Parish Council. The burial boards in England have expended millions on cemeteries; thousands of churchyards have been closed. There is also a very large number of cemeteries conducted by companies for profit. The administrative arrangements in Scotland are very similar; the ratepayers are entitled to raise the question of closing an old, or providing a new burial-ground by petition before the sheriff. (For Disinterment, see EXHUMATION, POST-MORTEM EXAMINATION, RESURRECTIONISTS.)

In the United States, neglect to bury a dead body by any one whose duty it is to bury it, and having sufficient means to do so, is a misdemeanour. It is also a misdemeanour to fail to notify a coroner that a body on which an inquest ought to be held is lying unburied, or to bury or otherwise dispose of such body without giving notice to the coroner.

For other matters connected with the subject of burial, see CEMETERIES, CHURCHYARDS; CREMATION, EMBALMING; TOMB, COFFIN, CATACOMBS, BARROWS, CAIRNS, PARISH, PYRAMIDS, STONE AGE, TOPE. And for the law of the subject, see Glen, *Law relating to Burial of the Dead* (1881); Baker, *Laws relating to Burials* (1882).

Burial Societies are friendly societies constituted in the usual manner, and with the express object of supplying a fund for paying the funeral expenses of the members on their death (see

FRIENDLY SOCIETIES). It became customary to enter the names not only of adults, but of children, in such societies. The proceedings of the criminal courts have shown that, in some instances, children on whose lives such an insurance was effected have been killed or allowed to die of neglect, and the alarm created by such instances was enhanced by the discovery that children were frequently insured in more than one society. To obviate this calamitous use of a beneficial arrangement, it was provided that no insurance of a child under six years of age in a burial society should be legal. The Hon. E. Lynph Stanley, Inspector under the Friendly Societies Act, 1875, says, in a report on Friendly Societies, 1885 (B.B. 89), referring to burial societies: 'I wish to make a general remark on burial societies which has been impressed upon me during this inspection. It is that I am satisfied that there is a large amount of insurance of persons without their knowledge by persons not entitled to insure them, and that in this way frauds are extensively practised on burial societies, and no doubt these are temptations to murder.' On the other hand, in evidence before the Select Committee on Friendly Societies in 1849, it was stated in respect of Liverpool, that in the societies of that city, numbering some 100,000 members, no case of death by violence for the sake of burial money had occurred. In the Friendly Societies Act of 1850, and in that of 1875 (38 and 39 Vict. chap. 60), stringent arrangements for certifying the cause of death have been adopted.

Buriats, a Mongol race, with several branches, in East Siberia, on both sides of Lake Baikal, numbering about 208,000. They are a peace-loving but slothful and discourteous people, prone to petty thefts, and passionately fond of drink. Though some have become good farmers, the majority are nomads, breeding cattle, or living by hunting and fishing. Some of the tribesmen have of late years, however, studied with success several branches of science; and the blankets, leather, and metal-work of the people are known throughout Siberia. Those dwelling west of the lake have conformed to the Greek Church, and the others have adopted Buddhism; but of most, Shamanism (q.v.) is still the actual religion. Under Russian rule since 1644, they yet preserve among themselves a patriarchal form of government. There is a Grammar and Vocabulary by Castren and Schiefner (St Petersburg, 1857) of their language; and a Grammar by Orloff (1878).

Buridan, JEAN, a French schoolman of the 14th century, born at Bethune, in Artois, about 1300, studied at Paris under Occam, became himself a teacher of the nominalist philosophy, and was rector of the university of Paris in 1327. Of his life almost nothing is known, but it is certain that he was alive as late as 1358. There is a tradition that he had to flee from France, and that at Vienna he helped to found the university, but this is contrary to historical fact. His works treat of logic, metaphysics, physics, ethics, and politics—almost every subject save theology, which he avoided because it does not rest on reason alone, the sole authority in philosophy. Like Occam, he denied objective reality to universals, which are mere words, singulars or individuals alone existing (see NOMINALISM). In his comments on the *Neomachean Ethics* of Aristotle he makes the will depend entirely on motives, the only freedom being a certain power of suspending the judgment and determining the direction of the intellect. The celebrated sophism known to the schoolmen under the name of Buridan's Ass, has been discussed at superfluous length, and with needless ingenuity, by Bayle. It occurs nowhere in his

books, and was no doubt due to some opponent who wished to cast ridicule upon his determinism. The sophism referred to is, that if a hungry ass be placed exactly between two bundles of hay of equal size and attractiveness, it must starve, as there is nothing to determine the will of the animal towards either bundle. (This hypothetical case is, however, found in Aristotle, *De Celo*, ii. 14, and in the fourth book of Dante's *Paradiso*.) His chief works are *Summula de Dialectica* (1487), *Compendium Logice* (1489), *In Aristotelis Metaphysica* (1518), and *Questiones in x. libros Ethicorum Aristotelis* (1489).

Burin, or GRAVER (Fr. *burin*, from Ital. *borino*; but originally cognate with English *bore*), the principal instrument used in copper-engraving, is made of tempered steel, and is of prismatic form, the graving end being ground off obliquely to a sharp point. The distinctive style of a master is frequently described by such expressions as a *soft burin*, a *graphic burin*, or a *brilliant burin*.

Burino. See CHIZEROTS.

Buriti Palm (*Mauritia Sagus vinifera*), a beautiful palm which grows in great abundance in the swamps of Northern Brazil, particularly on the Orinoco. It is one of the loftiest of palms, reaching 100 feet. The stem yields a kind of sago, which is cut in slices and eaten like bread; the pulp and seed of the sago-like fruit are eaten and made into sweetmeats—and the abundant sweet sap before flowering is drunk fresh, or is easily fermented into palm wine by the natives. Humboldt describes how the Guarani people at the mouth of the Orinoco not only derive their food from the tree, but make their nets, mats, hats, &c. from its fibres and leaves, and yet more literally live upon the tree, by suspending lints of its matting from stem to stem during the rainy season, annually returning to this arboreal existence. *M. flexuosa*, the Moriti or Sea Palm of Trinidad and Brazil, is of similar appearance and uses; but its leaves yield better fibre, and its stem a useful wood.

Burke, EDMUND, a celebrated orator and philosophic politician, was born in 1729 at Dublin, where his father had an extensive practice as an attorney. In 1741 Burke was sent to school at Ballitore, in the county of Kildare, and in 1743 entered Trinity College, Dublin. His undergraduate course was not marked by the ordinary distinctions, and he mainly devoted himself to a very extensive and desultory course of reading. Cicero was his favourite author. In 1748 he graduated B.A. Being destined for the English bar, he proceeded to London in 1750 to keep his terms at the Middle Temple. He never took kindly, however, to legal studies, and ultimately abandoned the idea of becoming a barrister.

The period from 1750 to 1760 in the life of Burke was a time of obscurity, spent chiefly in literary work, which in time brought him a considerable reputation. His first important publication was the celebrated *Vindication of Natural Society*, written in imitation of the style and ridicule of the reasoning of Lord Bolingbroke, in which, with well-concealed irony, he confutes Bolingbroke's views of society by a *reductio ad absurdum*. It was published anonymously in 1756, when its author was twenty-seven; with many of its readers it passed as a serious work. Soon after, in the same year, appeared his well-known essay, *A Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful*—a treatise which attracted considerable attention both in this country and in Germany, and which, though crude, contains much able and independent thinking (see ÆSTHETICS). The same year Burke made a happy marriage with the daughter of a Bath physician, Dr Nugent.

In 1759 the first volume of the *Annual Register* appeared, a work which Burke originated, and to which he contributed largely till 1788. These writings of Burke not only introduced him to society, but opened up a wider field of activity. In 1761 Mr W. G. Hamilton ('Single-speech Hamilton'), then Secretary for Ireland, having appointed him his private secretary, he returned to Dublin, where he spent about two years, and received a pension on the Irish establishment of £300. In return for this favour Hamilton claimed that Burke should thenceforward devote his whole time to his special service, with the result that they had a violent quarrel, and Burke threw up his pension.

On his return to London he became a member of the Literary Club, the history of which is associated with almost every considerable name in the literature of the period. But literary society did not draw his attention from the chances of a political career. In 1765 he became private secretary to the Marquis of Rockingham, at that time premier, and in the same year was returned to parliament as member for Wendover. He obtained the seat through the influence of Lord Verney. His eloquence at once gained him a high position in the Whig party, and in the House of Commons. The Rockingham administration, however, lived only about a year, and with it terminated his second political employment. Though he held no office till the downfall of the North ministry in 1782, the public activity of Burke never ceased till his death. His eloquence, political knowledge, and force of character gave him a foremost place among the statesmen of the time.

The times were, indeed, unfavourable for a *new man*, who had only his natural genius to rely on for advancement, and whose strong convictions unfitted him to be an instrument of mere court or party interests. At that time there were two great forces in English politics, the court and the territorial aristocracy. With the accession of George III., the court had reasserted itself, and by an unsparring use of the public money in influencing elections, had gathered round it a powerful party. George III. found a willing servant in Lord North, whose long administration from 1770 till 1782 was marked by the unsuccessful coercion of the American colonies, by corruption, extravagance, and a prevailing reaction. Against this policy Burke and his Whig friends could only raise a strong protest. The best of Burke's writings and speeches belong to this period, and may be described as a defence and exposition of sound constitutional statesmanship against prevailing abuse and misgovernment. His first great pamphlet was *Observations on the Present State of the Nation*, a reply to George Grenville, written in 1769. In 1770 he published another great political pamphlet *On the Causes of the Present Discontents*, which treats of the many questions arising out of Wilkes' controversy, and the attitude of the court. Three great writings on the American struggle are perhaps the finest of his many efforts. These are the speech on *American Taxation* (1774), the speech on *Conciliation with America* (1775), and the *Letter to the Sheriffs of Bristol* (1777). In all three Burke is the advocate, with reference to the colonies, of wise and liberal measures, which would have averted all the mischief that ensued. In 1774 Burke had to retire from his seat for Wendover, but the important constituency of Bristol elected him as its representative. His Bristol seat he lost through loyalty to his political convictions. He claimed the right not to be a mere delegate, but the reasoning and independent representative of his constituents. When proposals were made for relaxing the restrictions on the trade of Ireland with Great Britain, and for alleviating the laws against Catholics, he

supported them in opposition to the wish of his Bristol constituents. With regard to Ireland generally, he showed a knowledge of her affairs, and a sympathy with her people, worthy of the best statesmanship. He had a kindly and reverent feeling for Catholicism; his mother and wife had been brought up in that faith, and he always advocated a broad and liberal policy towards its members.

The enlightened views of Burke were not pleasing to the majority of his Bristol constituents. He lost the seat in 1780, and from that time till 1794 he represented Malton. When the disasters and difficulties arising out of the American war had at last brought Lord North's government to a close, Burke's patron, Lord Rockingham, was called to office in 1782. Under him Burke held the post of Paymaster of the Forces, and he resumed it under the coalition government headed by the Duke of Portland in 1783. His tenure of office on each occasion was for only a few months; and the emoluments were reduced to £4000 a year in accordance with the principles laid down by himself in his *Plan for Economical Reform*.

After the fall of the Whig ministry in 1783 Burke was never again in office, and he was so far misled by party feeling that he opposed Pitt's measure for Free Trade with Ireland and the Commercial Treaty with France. In 1788 he opened the trial of Warren Hastings by the celebrated speech which will always rank among the masterpieces of English eloquence. Till his death the energies of Burke were now practically absorbed by the French Revolution. Loving 'liberty only in the guise of order,' he had from the beginning regarded the proceedings of the Revolution with suspicion. In 1773, during a visit to Paris, he had learned to dread the new opinions current amongst the leaders of French thought, and the excesses which soon marked the progress of the revolutionary movement made him tremble for social order. In 1790 he appeared as the champion of the old state of things in Europe by the publication of his famous *Reflections on the French Revolution*. This book had an influence far beyond that of any other writing of Burke. In less than a year it reached its eleventh edition. It was read all over Europe, and tended powerfully to encourage its rulers in a strenuous resistance to the Revolution. In the subsequent career of Burke, his attitude to the Revolution had a decisive influence, alienating him from Fox and many of his other Whig associates, but giving him a position of credit and honour in the political world, and especially with the reactionary portion of it, which he never enjoyed before. As time went on, Burke became more and more vehement in his denunciations of the French innovations, till he became incapable of expressing a calm and rational judgment about them. Most of his subsequent writings, the *Appeal from the New to the Old Whigs*, *Thoughts on French Affairs*, and *Letters on a Regicidal Peace*, are marked by the passion with which he urges the government not only to fight the Revolution but to suppress free opinions at home. Burke died 9th July 1797. He was buried in the little church at Beaconsfield, where in 1768 he had purchased the estate of Gregories. During his whole political life Burke's private affairs were sadly embarrassed. He had to borrow money to buy his estate, and he was always deeply in debt. He had considerable pensions granted him in 1794. A proposal to raise him to the peerage under the title of Lord Beaconsfield on his retirement from the House of Commons in that year, was arrested by the death of his only son.

Burke ranks as one of the foremost orators and political thinkers of England. He had vast knowledge of affairs, a glowing imagination which kindled everything he touched, a wide and passion-

ate sympathy with the most remote and unfamiliar conditions of life as shown in his great speeches on India, and an inexhaustible wealth of powerful and cultured expression. His manner and delivery as a speaker, however, was unattractive and even awkward and ungainly. Speeches which captivated the reader only served to empty the benches of the House of Commons. Generally, and especially in his earlier days, he was on the side of an orderly freedom and a well-considered progress; yet it should be remembered that party feeling led him to oppose some of the wisest and most liberal measures of the younger Pitt, and that the fiery vehemence of his utterances on the French Revolution did much to let loose the passions which made Europe a scene of war for three and twenty years. His views were lucid, comprehensive, and philosophic. Society he regarded as a stable and orderly system moved by large historic influences; but in his passionate reverence for ancient order, he greatly exaggerated the value of things as they were. The irritable and untractable temperament which grew upon him during his later years, together with his circumstances as a *new man* handicapped by social prejudice, prevented him from attaining a worthy position in the ministries of the time. Yet in the application to politics of vast knowledge, high moral principle, great intellectual power, and rich and noble gifts of expression, he still stands unrivalled among English statesmen and orators.

A collected edition of his works in quarto, began in 1792, was finished in 1827; another edition of *Works and Correspondence*, in 8 vols. 8vo, in 1852; an edition of *Select Works* by E. J. Payne in Clarendon Press, 3 vols. 1874-78. His writings on Irish affairs were edited by Mr Matthew Arnold in 1881. The best biography of Burke is that of Sir J. Prior (1824; 5th ed. 1854). See also J. Morley's *Edmund Burke, a Historical Study* (1867); his admirable sketch in the *Men of Letters* series (1879); and Dilke's *Papers of a Critic* (1875).

Burke, Sir John Bernard, herald and genealogist, the son of John Burke (1787-1848), representative of a Tipperary family, who settled in London as a literary man, and in 1826 published the *Peerage and Baronage of the United Kingdom*. The son, born in London in 1815, and educated at Caen in Normandy, was trained as a lawyer, and called to the bar in 1839. In 1853 he was appointed Ulster King-of-arms, was knighted in 1864, became LL.D. of Dublin in 1867, C.B. in 1868, and in 1874 governor of the National Gallery of Ireland. He died 13th December 1892. Besides editing the successive issues of the *Peerage* founded by his father (55th ed. 1893), he published other works on *Landed Gentry* (1846), *Extinct Peerages* (1846), *Anecdotes of the Aristocracy* (1849), *Family Romance* (1853), *The Vicissitudes of Great Families* (1859), *The Rise of Great Families* (1873), and *Reminiscences* (1882).

Burke, Robert O'Hara, one of the first white men to cross the Australian continent from south to north, was born at St Cleran, County Galway, in 1820, was educated in Belgium, served in the Austrian army (1840), became captain, joined the Irish constabulary (1848), and emigrated to Australia in 1853. While inspector of police in Victoria he accepted the leadership of an expedition for crossing the Australian continent. After many hardships, Burke and Wills reached the tidal waters of the Flinders River. Burke died of starvation on his return journey, 28th June 1861. An expedition brought his remains and Wills's to Melbourne; and statues have been erected to their memory. See *AUSTRALIA*, vol. i. p. 592; and Wills's *Exploration of Australia* (1863).

Burke, William, born in 1792, the partner with William Hare in a series of infamous murders. Both Irishmen and labourers, the latter started a lodging-house in a West Port close, Edinburgh, to which Burke came to live in 1827. Towards the close of that year they sold for dissection to Dr Robert Knox, instead of burying it, the body of an old pensioner who had died in the house, and the ease and safety with which they had earned this money tempted them to commit a series of murders to procure more bodies. Their plan was to inveigle unknown travellers into the lodging-house, make them drunk, and then suffocate them in such a way that the bodies showed no marks of violence. With the help of their wives they had already murdered fifteen persons, and received from Dr Knox for their bodies sums of money varying from £8 to £14, when their infamous trade was discovered by the police, aroused by the suspicions of the neighbours. Hare, the more execrable wretch of the two, was admitted king's evidence, and after his release found shelter in a nameless obscurity; while Burke was hanged, amid the execrations of the crowd, 28th January 1829. His abhorred name has added a word to the English tongue.

Burkitt, William, commentator, was born at Hitcham, Suffolk, in 1650. He was educated at Stowmarket, and Pembroke Hall, Cambridge, and must have been ordained at a very early age, as in 1672 he was curate, afterwards rector, at Milden, in Suffolk. In 1692 he was preferred to the vicarage of Dedham, in Essex, and here he died in 1703. Burkitt's sermons were soon forgotten; his *Notes on the four Evangelists*, and his *Expository Notes on the New Testament*, were long popular. The last was a meritorious compilation, although as Doddridge said, the 'sentiments vary in different parts of the work, as the authors from whom he took his materials were orthodox or not.'

Burleigh. See BURGHLEY, and BALFOUR (JOHN).

Burlesque (through Fr. from Ital. *burlesco*, 'a jest'), denoting a style of speaking, acting, writing, drawing, is a low and rude grade of the comic. The legitimate comic brings together contrasts with a final view to harmonising and reconciling them; the burlesque distorts and caricatures, and brings the incongruities into stronger relief. The farce is the burlesque of comedy. Deformities and monstrosities that excite disgust do not belong to the burlesque. The lofty and the abject, the great and the little are conjoined, with the sole view of exciting a laugh. Nor does the true burlesque turn real greatness and nobility into laughter, but only sham greatness—false pathos, and all hollow pretension and affectation. There is pure burlesque in Aristophanes, but the modern burlesque in sustained form may be said to have originated among the Italians, more particularly with the poet Berni. The genuinely national *buffone* of the Italians personates the burlesque. Carlo Gozzi, in his tragi-comedies, is perhaps the greatest in this vein. Some of the more remarkable burlesques in English literature are Chaucer's *Règne of Sir Thopas*, a burlesque of the long-winded and interminable stories of the middle ages; Beaumont and Fletcher's *Knight of the Burning Pestle*, on the imitations of the tales of chivalry; and the Duke of Buckingham's play, *The Rehearsal*, intended to ridicule the heroic language in contemporary plays. There are no happier examples in English than some of *The Rejected Addresses*. Butler's *Hudibras* has much of the burlesque in it, but is a book that stands quite by itself. Similarly, *Don Quixote* contains burlesque elements enough, while it is one of the greatest and wisest books in the world. Parody or Travesty is a species of

burlesque. See *Burlesque Plays and Poems* in Morley's 'Universal Library' (1887), and W. D. Adams's *Book of Burlesques* (1891).

Burlingame. ANSON, American diplomatist, born in 1820 at New Berlin, New York, was educated at Harvard, and after settling as a lawyer at Boston, became a prominent member of the Free-soil party. Elected to the Massachusetts senate in 1853, he entered congress in 1854. He was sent as United States minister to China by President Lincoln; and when, in 1867, he was returning home, the regent, Prince Kung, made him special Chinese envoy to the United States and the great powers of Europe. As such he succeeded (1868) in securing the acceptance and ratification by the United States and China of the Burlingame treaty, by which China officially accepted the principles of international law. He subsequently visited England, France, Denmark, Sweden, Holland, Prussia, and Russia as Chinese envoy, and died at St Petersburg, 23d February 1870.

Burlington, the name of three cities in the United States: (1) The capital of Des Moines county, Iowa, on the right bank of the Mississippi (here crossed by a railway bridge), 207 miles WSW. of Chicago by rail. It occupies a natural amphitheatre formed by the limestone bluffs which slope backward from the river, and is an important centre. Laid out in 1834, it is the seat of a Baptist college, and has manufactures of machinery, farming implements, flour, carriages, &c. Pop. (1870) 14,930; (1890) 22,565.—(2) A port of entry of Burlington county, New Jersey, on the Delaware, 20 miles above Philadelphia, with which, as well as with New York, it is connected by rail. It possesses an Episcopalian college (1846), and large manufactures of shoes, ironware, thread, &c. Pop. 7264.—(3) A port of entry and capital of Chittenden county, Vermont, and the most populous city in the state, beautifully situated on the eastern shore of Lake Champlain, 40 miles WNW. of Montpelier by rail. It has a good harbour, with a breakwater and lighthouse, and has access by canals and the Richelieu River to the Hudson and St Lawrence, besides railway communication with all parts of the United States and Canada. It is the seat of the State Agricultural College (1865), and of the Vermont University (1800), which crowns the slope on which the city stands. It has cotton, flour, and planing mills, machine-shops, and manufactures of furniture, &c., and is one of the largest lumber markets in the United States. Pop. (1870) 14,387; (1880) 11,365; (1890) 14,590.

Burlington. See BRIDLINGTON.

Burma is the largest of all the provinces of the Indian empire. It stretches from 28° lat., on the confines of Tibet, southward for 1100 miles, to 10° lat., far down the Malay Peninsula, and from 103° long., on the Chinese border, for 700 miles westward to the Bay of Bengal. It is continuous with China and Siam on the east; and for the rest it is bounded by the Indian provinces of Bengal and Assam, and by the ocean. Its total area is about 280,000 sq. m., of which one-third belongs to the old province of Lower Burma and two-thirds to the new province of Upper Burma. The country consists of the great basin of the Irawadi and its affluents; the rugged country drained by the Salween and Sittang rivers, on the upper waters of which are situate the Shan States; and the narrow maritime provinces of Arakan and Tenasserim. The deltas of the Irawadi, Salween, Sittang, and Koladan rivers are flat plains, and there are smaller areas of level land at the mouths and on the banks of some of the feeders of the Irawadi. The level cultivable plains probably do not exceed

50,000 sq. m. in all. The rest of Burma is hilly broken country, covered for the most part with forest. There are large highland tracts, with a ruling elevation of 2000 to 4000 feet. The principal hill-ranges are the Patkoi Mountains in the north, which reach at one point a height of 12,000 feet, and from which outliers jut far down into the valleys of the Irawadi and the Chindwin; the China hills in the north-east, culminating in perpetual snow-peaks 15,000 feet high, close to the Chinese city of Talifoo; the Arakan Yoma range, running from Bengal to Cape Negrais; the Pegu Yoma range, separating the Sittang valley from the basin of the Irawadi; the Tenasserim range, running from the Salween River to the foot of the Malay Peninsula; and lastly, the Shan States, a vast upland, cleft by deep chasms, in which flow the Salween and the Cambodia rivers and their feeders. The chief river of Burma is the Irawadi, with a course of probably 1100 miles from its unknown source in the snows of Tibet down to the Bay of Bengal. This great stream is navigable all the year round by river-steamers, which, with their flats, carry 1000 tons of cargo and hundreds of passengers up to Blamo, 700 miles from the sea, and 50 miles from the Chinese border. Some hundreds of miles of deltaic channels of the Irawadi are also navigable by large river-steamers. Of the affluents of the Irawadi only the Chindwin, the Shweli, and the Myit-nge are navigable by large craft. The Chindwin is navigable for 300 miles in the rainy, and 150 miles in the dry season. The Salween River, which has its origin in the Tibet snows, is navigable for only about 80 miles from the sea. The Sittang River rises in the hills to the south-east of Mandalay. All these rivers and many of their feeders are traversed in the rainy season by tens of thousands of native barges and boats, which carry cargoes up to 120 tons. The rivers are the chief, and were, until British occupation, the only highways of the country. During the dry season all the rivers, except the very largest and the tidal channels, are too low for navigation; and therefore, until recently, no movement of heavy goods for any distance could take place from December to July over the greater part of the country. During the flood season the Burma rivers top their banks. The Irawadi at Prome, 200 miles from the sea, is about a mile wide, and there the difference between the highest and lowest level of the river is 45 feet. During the great floods the river water spreads over the country; and sometimes the flood-waters of the Irawadi submerge the country for 10 or 15 miles on either side to a depth of 4 to 14 feet. The inundated villages, however, do not suffer, as the houses are all built on piles, and the flood-waters move slowly.

Climate and Rainfall.—The rainfall varies widely in different parts of Burma. Along the coast from Akyab to Mergui the average rainfall exceeds 200 inches a year at each of the six registering stations. At Bassein, Rangoon, and Pegu, a little way inland, it averages 100 inches. Up the Irawadi valley the rainfall decreases rapidly; at Prome it is 42 inches, and at Thayetmyo only 37 inches. Information about the rainfall of Upper Burma is as yet meagre. Apparently there is a dry belt, with less than 30 inches of rain per annum, from Thayetmyo to Myingyan; at Mandalay, where the hills approach the river, the rainfall is about 45 inches a year; it may increase to 60 inches at Katha, and perhaps to 80 at Blamo. On the Upper Chindwin, on the Ruby Mines plateau, on the Shan hills, and in the narrow valleys of the Salween and Sittang, the rainfall is heavy. In the delta and along the coast the rainy season lasts for five, six, or sometimes even seven months. During

those months the climate is very moist, but the heat is by no means excessive. From the middle of November to the end of January the climate is cool, and the thermometer at dawn sometimes falls as low as 60° F. From February to the end of April the climate of the delta is dry and hot, and the thermometer occasionally reaches 100° in the shade; but the nights are always cool, and there is never any hot wind as in India. Higher up the Irawadi valley at Prome, Thayetmyo, and in the dry belt, the climate is much hotter and dryer in the summer, and it is much cooler in the winter months. At Mandalay and Bhamo the months of December and January are cooler still; at Mandalay and over the dry belt, the dust and glare are sometimes excessive in April and May. On the Ruby Mines plateau, at an elevation of 5600 feet, the thermometer in the shade does not exceed 86° in the hottest season: in this neighbourhood an attempt is being made to found a sanatorium for European troops. The climate of Burma is more trying to Europeans than that of the plains of India.

Flora and Fauna.—The forests of Burma contain an abundance of useful and beautiful trees. The most important and valuable tree is the Teak (*Tectona grandis*). Teak trees, as well as trees of other kinds, are seen 15 to 25 feet in girth, and 90 or 120 feet from the ground to the lowest branch. The most beautiful and not the least useful of the products of the Burma forests is the bamboo. Different species, from the slender bamboo used for arrows, up to the giant bamboo 9 inches thick and 100 feet high, are employed for manifold purposes (see BAMBOO). Several Burma trees produce valuable wood-oil, varnish, tannin, and gums; and many creepers yield valuable fibres. There are rubber-yielding creepers besides the *Ficus elastica*; and gutch, obtained from the *Aucua catechu*, is a most valuable gum. Orchids, ferns, and mosses of much beauty are found in abundance. Ground flowers are comparatively few; but a Burma forest, particularly in the month of March, is quite bright with the many colours, and sweet with the varying scents of thousands of flowering trees, flowering creepers, flowering shrubs, and orchids.

Among the wild animals of Burma may be mentioned the elephant, three species of rhinoceros, tapir, buffalo, bison, many kinds of deer, small wild cattle, hog, tiger, leopard, bear, and wild dog. The forests are so vast, and in parts so dense, that the pursuit of wild animals is difficult. Among domestic animals, the buffalo, oxen, elephants, and ponies are all good. No horses are bred, sheep and goats are rare, and donkeys are hardly ever seen. The domestic fowls are better than in India. Pythons and cobras abound; and the hamadryad, the most deadly of eastern snakes, is occasionally met. The variety of birds is immense: the peacock of Burma is larger and more gorgeous than its Indian congener; the argus pheasant, the golden and the silver pheasant, are the most brilliant of the gallinaceous birds; aquatic birds, from the pelican and wild goose down to the snipe, abound. The quantity and variety of the fish caught on the coasts and inland waters of Burma are prodigious. Alligators are not usually eaten, but every other inhabitant of the water, from the shark down to the shrimp and sea-slug, either fresh or dried and salted, contributes to the food of the Burmese. Among the rarer delicacies furnished by marine creatures may be named the edible birds'-nests found in the caves of the Mergui Archipelago, and the eggs of the sea-turtle. The right to collect these eggs is leased by the state; and a small turtle-bank, not one mile long, on an island near one of the mouths of the

Irawadi, yields a rental of £1500 a year to the public treasury for turtle-eggs only.

Minerals.—The geology of Lower Burma has been examined by scientific officers of the Survey. Gold is found in small quantities by washing river-sand; silver is extracted at lead-workings in the Shan States, but not in great quantity. Iron, copper, lead, and tin exist in great quantity, but none of these pay for working, except tin, which is worked by Chinese settlers in the Mergui district. Attempts to work tin and lead after European methods have failed. Earth-oil or petroleum is found at many points on the Irawadi River and in Arakan. The Irawadi oil is a dark, viscous fluid, yielding only 20 per cent. of burning oil; while the Arakan oil is a light-coloured, clear fluid, that can be burned in a lamp as it comes from the well. About 550 wells in the Irawadi oil-region, and 150 wells in the Arakan region, are or have been worked. As yet, nothing in the shape of a springing well or of a constant supply has been found. Jade and amber are both found and worked in the country north of Bhamo, on the feeders of the Chindwin River. The mines are worked by the local tribes under the superintendence of Chinese; and jade is exported to China and Japan to a value of some £50,000 a year. Fine white marble is found near Mandalay, and is used for images of Buddha and for ornamenting pagodas. Coal exists at several places in the Shan States, at Kalé on the Chindwin River, and at Thingadaw on the Irawadi River above Mandalay. All these coal sources are in Upper Burma; one only, that on the Chindwin River, is being worked for steamer-fuel; some of the others were examined in 1887. The coal found as yet in Lower Burma has proved of poor quality and scanty in quantity. Limestone of good type is found and burned in many parts. Building stones are found in most districts outside the delta; near Mandalay the stone is particularly good. The ruby mines north of Mandalay yield the best rubies in the world. The ruby-yielding area stretches over about 200 sq. m. Rubies are found by sinking holes down to the ruby-bearing stratum, and then sifting or washing the earth raised therefrom. The mines were worked in rude fashion, and yielded about £100,000 worth of rubies a year. All large stones were royal property, but, in practice, most of the valuable gems were secreted and smuggled away. European machinery and skill have since 1888 been applied to working these mines.

Population.—The census of February 1881 showed the population of Lower Burma to be 3,736,771, that of 1891 gave 4,569,680 for Lower Burma, and 2,984,730 for Upper Burma, without the Shans (q.v.), who number about 2,000,000. Probably the whole population of Burma may be distributed somewhat thus:

Burmans.....	5,450,000
Shans.....	2,000,000
Karens.....	700,000
Other hill tribes.....	800,000
Indians, Chinese, Europeans, and others.....	300,000
Total.....	9,250,000

The Burmans are a short-statured, thick-set people; they wear long hair on their heads, but have little hair on their faces. They are flat-featured, and nearer the Chinese than the Aryan type. They are excitable and impulsive; fond of fun and laughter; much given to dramas, dances, and shows of all kinds; up to a certain point courageous. They are callous to suffering in others, and ready to commit crimes of violence. Dacoity or robbery with violence by gangs is a common crime among Burmans; the proportion of violent crimes and of convicts to the population is far larger than in any other Indian province. Burmese

women are well treated; they go to market, keep shops, and take their full share in social and domestic affairs. Men and women are well clad; they delight in gay colours and in silk attire. Burmese young men and maidens arrange their matrimonial affairs for themselves when they grow up. Women as well as men can procure divorce for good

Buddhist Monks, with their Pupils.

cause. Widows and divorced wives can re-marry. Burmans make good peasant farmers, good boatmen, good shopkeepers. But they are unmethodical and unpunctual; they do not make good soldiers, or policemen, or factory hands. They are lavish in their expenditure, and seldom hoard money. The general level of prosperity and standard of comfort is high; there are few poor, and no beggars. The wages of unskilled labour may be quoted at 4 rupees a week in the delta districts, and at 2 rupees in Upper Burma, as compared with 1½ rupees in continental India. The staple food of the people is rice, which is as cheap as in India. Burmans eat fish or meat daily, and have more liberal diet than Indians of the same class. The existence of ample fertile land, near to good markets and available on payment of a moderate land-tax, explains the high rate of wages. Burmans are Buddhists by religion, and their form of Buddhism is purer than in any other country except Ceylon. There are no large land-owners, and there is no aristocracy in the country except the officials. The most influential and respected class are the Buddhist monks, whose function is to set an example of a correct life, and to instruct the young. These monks, of whom there are over 20,000 in the country, strictly observe their vows of celibacy and poverty; but they can unfrock themselves and return to the world when they please. They shave their heads, wear yellow robes, and live in monasteries. They are well cared for by their lay supporters. No monastery or pagoda has any property or endowment.

The Shans resemble the Burmans; but being highlanders, are poorer, hardier, and more courageous. They have a remarkable turn for trading of all kinds. The Karens used to be nature-worshippers; they were despised and oppressed by the Burmans among whom they lived. They are less clever, but more persevering and methodical than Burmans. A large number of Karens have embraced Christianity at the teaching of Ameri-

can Baptist missionaries; and now there are over 500 parishes of Christian Karens, containing nearly 200,000 souls; each parish supports its own church, pastor, school, and schoolmaster. The Chins live in the uplands between Arakan and the Chindwin River; they make yearly raids upon the peaceful villages of the Kubo and Chindwin

valleys. Some Chin settlements are found on the hills of Lower Burma, where they live very poorly. The Kachins inhabit the hills, and dominate the trade routes north and east of Bhamo: they used to levy blackmail on caravans to China. They are courageous, and defend their mountain fastnesses well. They command the approach to the jade mines, and the path from the Upper Irawadi into the Assam valley. Close under the Assam hills the Chins merge into and are apparently identical with the Singphos. The Paloungs are the wildest of the Shan races; they pluck and send to market wild tea from their hills.

Language.—The Burmese language is monosyllabic; it is written from left to right; the shape of the letters is circular; and most of the letters are perhaps rounded modifications of Sanskrit letters. The grammar is simple; but the language is difficult to acquire perfectly by reason of its many breathings and tones. Among other peculiarities of the language, two may be mentioned. Ordinary acts, such as sleeping, eating, or walking, are denoted by different words according to the status of the actor; and, when a number of persons or things is mentioned, a generic noun is added after the numeral. For instance, one man = *lu ta youk*, or man one person; two monks = *pongyi na ba*, or monks two holy men; three cows = *nawa ma thôn gong*, or she cattle three head; five hills = *toung nga lôn*, or hills five round things; ten guns = *they nat tsé let*, or guns ten long things. Burmese has been a written language for perhaps 800 years. The Shan language has also been long written; it is akin to Burmese. Karen has recently been reduced to writing by the American missionaries. None of the other hill tongues are written languages. The classical language of Burma is Pali, in which are written the sacred books and the laws of Mann. Pali manuscripts are kept in many monasteries, and learned monks study Pali. The older literature of Burma consists of manuscript Pali books on religion and law, and of Burmese translations from these books. There are some few more or less apocryphal histories in Burmese. The favourite literature of the country consists of dramas and poetical fables. Of late years tens of thousands of copies of old and new dramas and fables have been struck off by presses established at Rangoon. About 1872 it would have been nearly impossible to find a book anywhere save in a monastery or in a large town. Now printed books are finding their way all over Lower Burma, and are sold in nearly every market. There are seven or eight vernacular newspapers. A. Judson published a grammar (1866; new ed. 1891) and a dictionary (3d ed. 1877), and A. W. Lonsdale a grammar (1899). The name Burma is, according to Yule in *Hobson-Jobson*, an Englished form of *Mram-ma*, pronounced by the people *Bam-má*. The following passage is the translation of John iii. 16.

in Burmese, as published by the British and Foreign Bible Society (and see ALPHABET, vol. i. p. 189):

ဘုရား သာဓကိသား တော်ကိရု ကြံသော
သူအပေါင်းတို့သည့်ပျက်စီးခြင်းသို့မရောက်။ အ
စည်ထားဝရ အသက်ရှင်ခြင်းကိုရ စေခြင်းငှါဘု
ရား သာဓကိသားတော်ကိရု တော်မူသည့်တိုင်အောင်လောကီသ
ားတို့ကိုချစ်သနားတော်မူ၍။

Education.—The primary schools of the country are the Buddhist monasteries, in which every Burman lad *must*, according to national custom, sanctioned by religion, spend a part of his boyhood as pupil and as acolyte. At every monastery boys are taught to read and write; in Lower Burma most monasteries have accepted inspection by public officials, and teach up to the government standards. Some of the improved monastic schools have 120 or 150 boys apiece, and earn up to £100 a year as grants in aid. Census figures show that over 60 per cent. of the males in Lower Burma above the age of twelve could read and write. Girls are not admitted to monastic schools; but they are frequently taught with boys in lay schools, and schools for girls are being gradually established. Recent statistics of education for Lower Burma show:

	Number of Institutions.	Boys and Girls on Rolls.
Colleges.	1	20
Secondary Schools.	70	8,881
Primary Schools (chiefly monastic)	5325	149,621
Training and Technical Schools.	16	410
Total	5412	158,932
Boys, 143,715; Girls, 15,217.		

Trade.—The external sea-borne trade of Lower Burma is valued at fourteen millions sterling. Most of this trade centres in Rangoon. The chief export items are rice, valued at six millions sterling; teak timber, one million; cutch, hides, cotton; while the chief import items are cotton piece-goods and yarns, silk goods, coal, hardware, salt, and metals. The trade between British and Upper Burma before the last war was valued at three and a quarter millions sterling. The great staple of Lower Burma is rice, of which as much as 1,150,000 tons are exported in one year. This great trade has been fostered by the establishment of rice-cleaning mills at all the seaports. Burma rice goes direct to England, Germany, Italy, America, Singapore, and China; it fetches a better price than any Eastern rice except the Japan and Java products. It is usually quoted about 20 per cent. above the rice of Saigon or Bangkok. The activity of internal trade in Burma may be measured by the financial success of the Irawadi Flotilla steamers, and of the two railways.

Arts and Manufactures.—The arts in which Burmese excel are wood-carving, silver repoussé work, woven silk fabrics of many colours, and lacquer-ware. In wood-carving Burmese workmen display much skill and imagination; each man draws on the wood his own patterns, according to his own fancy, before he begins with his graving tools. Much of the lacquer-ware is made on delicate woven bamboo frames. Excellent boats are built on all the larger rivers. The foundation,

or lower part of the hull, always consists of a hollowed, widened trunk of the thingan tree; the sides are built up with planks; both prow and stern are raised several feet above the deck, and are ornamented with much beautiful and grotesque carving.

Public Works.—Under Burmese rule no roads or public buildings save temples and monasteries were made by the state; but certain valuable, though short, irrigation canals were made near Mandalay, Kyaukse, and Salen; while in many towns and villages brick pathways were laid down, and bridges were built, as works of religious merit. Since Burma came, province by province, under British rule, about 500 miles of metalled and bridged roads have been made, besides streets and roads in towns; three navigation canals, aggregating 70 miles in length, have been dug; many cross-country roads and paths have been cleared; two railways, aggregating 330 miles, had already been opened, when a third (1888), 440 miles long, connected Mandalay, the capital of Upper Burma, with the seaboard; embankments to keep flood-waters off the land have been erected for 250 miles along the banks of the Irawadi River; the Irawadi Flotilla Company have placed on the Irawadi River a fleet of forty-seven large steamers and one hundred flats; court-houses, hospitals, schools, barracks, prisons, churches, and public offices have been built all over Lower Burma, and are being begun in Upper Burma; and the peace of the country is safeguarded by forts at Rangoon, Thayetmyo, Toungoo, Mandalay, and Bhamo, as well as by batteries at the ports of Rangoon and Maulmain.

Architecture.—Everybody in Burma lives in either

Shwya Dagon Pagoda at Rangoon.

a wooden house or a bamboo hut, save in the large towns where a few rich people have built masonry

houses. Every house is built on posts or piles, so that the lowest floor is from 1 foot to 12 feet off the ground. In the inundated tracts house-posts are necessarily high; but even in upland country a Burman always has a space between his lowest floor and the ground, as he deems it unhealthy to sleep on the ground. Well-to-do people build their houses of teak or other wood planks; the high-pitched roofs, with projecting eaves and carved finials, are picturesque. The solid pagodas of masonry, and the teak monasteries, surmounted by three or seven-tiered roofs, and ornamented with beautiful or grotesque carvings, are the most notable structures in Burma. Monasteries (*kyoungs*) and rest-houses (*zayats*) are erected in every town and village by devout Burmans, who consider that such works secure for them *kútho*—that is, merit or reward in the next life. Rangoon, Maulmain, Prome, and Pegu, all possess beautiful pagodas and monasteries; so also do many towns on the banks of the Irawadi. But Mandalay is famous beyond all places in Burma for the number of its monasteries. The finest and most sacred pagoda in Burma is the Shway Dagón Pagoda at Rangoon; and among the finest monasteries are the Atoo-mah-see ('incomparable') Monastery, and the Mee-baya ('Queen's') Monastery at Mandalay. The most graceful wooden structure in Burma is the lofty woodwork spire above the hall of audience in the Mandalay palace; the exterior is gilded, beautifully carved, and lit up with innumerable mirror facets.

Finances.—The rate at which the revenues of Lower Burma have increased since the annexation of Pegu in 1854 may be seen from the following figures:

1855	total revenue, 45 lakhs.
1861.....	" " 50 "
1871.....	" " 123 "
1880.....	" " 270 "
1886.....	" " 308 "

As a lakh of rupees is equal to £7500 at an exchange of 1s. 6d. per rupee, these 308 lakhs would equal £2,310,000. But 34 lakhs must be deducted as being rather municipal than public; so that the total public revenue in 1886 was 274 lakhs (£2,055,000). In the same year the imperial expenditure was 184 lakhs. In the year 1892-93 the total revenue of Burma, Lower and Upper, was 38,232,210 rupees, the expenditure 24,561,220, leaving a surplus of 13,670,990 rupees (rupee then worth 1s. 1½d.) for the Indian treasury.

Land is held by petty occupiers direct from the state, on payment of a land-tax, ranging ordinarily from half a rupee to 2½ rupees per acre. The average value of the rice crop on an acre may be quoted at 20 rupees, so that the land-tax is probably about one-tenth of the gross yield. The total area under cultivation is close on 5,000,000 acres, of which six-sevenths are under rice, and 300,000 acres are kept fallow. The capitation-tax is an old Burmese impost, leviable on all adult males. The usual rate is 5 rupees a year for each married man, and 3 rupees for each bachelor.

All forests belong to the state, and the teak tree is everywhere reserved by ancient custom and by law as a royal tree. In all reserves conservancy and reproduction of teak is scientifically conducted.

Excise revenue is raised by a still-head duty of 4 rupees per gallon on all London-proof spirit, by fees paid for licenses to sell opium and liquor, and by the sale of Bengal opium to licensed vendors. The excise revenue remains low by reason of the refusal to license additional liquor or opium shops. There are in Lower Burma only some 20 licensed opium shops, as compared with 68 shops in 1880. The salt-tax is levied at 3 annas per maund (about 5d. per cwt.), or one-tenth of the Indian salt-tax

rate. Most of the salt consumed in Burma comes from Europe; some little is made locally from sea-water and from brine-wells. The import customs revenue to the amount of 7 lakhs a year is derived from duty on imported liquors. Export duty to the amount of 50 lakhs is levied on rice exported by sea, at the rate of 3 annas per maund, equal to about 7 per cent. *ad valorem*.

During the best times of Burman rule the public revenues of Upper Burma were approximately about 95 lakhs. But, for various reasons, more than one-third of the nominal revenue of the late government was lost to the British administration; and for some years the cost of occupying the country by troops and military police was very great. And so Upper Burma caused a heavy drain on the Indian exchequer. The cost of the army and military police was largely reduced as the country was brought into order. A convention was concluded with China in 1894 by which Burmese goods had free passage into China for six years, the duty arranged for ultimately being 6 per cent. *ad valorem*. In the same year the Northern Chin Hills were subdued and disarmed.

Government.—Burma is governed by a lieutenant-governor (till 1897 a chief-commissioner), whose headquarters are mainly at Rangoon. The territory is divided into eight provinces, over each of which a commissioner is the supreme judicial and executive officer; and each commissionership is again divided into districts. The deputy-commissioner is the head of his district in all executive, judicial, police, and revenue affairs; he has under him one or more European assistants; and each district contains five to ten townships (*myos*), over which presides a Burman magistrate. Beneath the township officer are the circle officers (*thugyis*). In each village one of the chief inhabitants is appointed headman, and is vested with petty police and revenue powers. The district administration is supported by a strong police force, partly Burmans and partly Indians, who are commanded by European officers. A military garrison, consisting in 1894 of 14,500 men (4000 Europeans), occupies the country.

History.—The royal chronicles kept by the kings of Ava derive the earliest Burmese dynasty from Buddhist monarchs in India. It is conjectured that the Burmans came into the Irawadi valley from the highlands of Central Asia about 2000 years ago, and amalgamated with the races then living in the country. It seems certain that the Buddhist religion and a Buddhist dynasty were established on the Irawadi, perhaps near Prome, about the time of the Norman Conquest. In the 12th and 13th centuries flourished Burmese kings who had their capital at Pagán on the Irawadi, about 400 miles from the sea, where are still extant most remarkable groups of temples built by that dynasty. In those days Burmese was a written language, and the Pagán kings had a civilised court. After that time the seat of power was transferred at intervals to Pegu, to Tonngoo, to Prome, to Sagain, and to Ava. The empire was wrested from the Burmans, and held for a short time by the Shans, and by the Talaings, a race who had preceded the Burmans in the Irawadi delta. In the 16th century a European traveller visited the court at Pegu, and has recorded an account of its magnificence. During the 17th century settlements in the Irawadi delta were made by the French and the English. At Syriam, near Rangoon, the Portuguese had established themselves nearly two centuries earlier. The last Burman dynasty was founded by Alompran (Ahompya), a Burman villager of Monshobo (Shwebo), 50 miles north of Mandalay. He rose against the Pegu king in 1753, and eventually established his power over Burma in 1757,

but died at the head of his army during an invasion of Siam. His successor carried Burmese arms to Arakan, Manipur, and the capital of Siam. During the later part of the 18th century Siam revolted, and Burma suffered three invasions by Chinese armies from the north. Early in the 19th century the Burmese conquered Assam, and about 1820 they first came into contact with the British power in India. The Burmese made incursions into British territory, maltreated British subjects, attacked British troops, and refused repeated demands for redress. In 1824 broke out a war which ended (February 1826) with the Yandabo treaty, whereby Ava ceded to the British the provinces of Arakan and Tenasserim. For a while the Burmans observed the treaty. But after 1830, when a new king succeeded to the throne, slights and insults were put upon the resident, who had to leave the capital and reside at Rangoon. By various acts the Burmans showed their hostility and contempt for the British. Eventually they seized certain British sailors, and refused redress. After a final protest by the British, war again broke out, and ended, after ten months' duration, in the acquisition of Pegu by the British. King Mindoon Min, who succeeded to the throne in 1853, made compacts with the British, treated traders well, entertained an English resident at Mandalay, and abstained from anything that might provoke hostilities. During the crisis of the Indian Mutiny in 1857 the Burmans kept quiet. In 1879 this enlightened monarch died, and was succeeded by his son Thebaw, whose accession was signalised by the massacre of his brothers, sisters, and relatives. The British resident protested against these barbarities, and his position at Mandalay was made so perilous that he was recalled. From 1880-85 the Mandalay government showed unfriendliness in many ways; infringed the terms of the existing treaty; arranged to give to a rival European power preponderating influence on the Upper Irawadi; and imposed a fine of a quarter of a million sterling on a British company working in Upper Burma. The Mandalay government refused requests for redress; in October 1885 an ultimatum was despatched to Mandalay, the terms of which were refused; and early in November King Thebaw published a proclamation calling all Burmans to join him in driving the English into the sea. On the 15th November a British force crossed the frontier and steamed up the Irawadi. What little resistance was made proved ineffectual. By the 28th November the Burmese troops had laid down their arms at Ava; the capital (Mandalay), with the palace, fort, and arsenal, were surrendered; and the king was carried off captive to India. Early in 1886 the whole of Upper Burma was incorporated with the Queen's Indian dominions. For a time guerilla warfare was waged in different parts of the country; but by 1895 the country was practically pacified.

See Forbes, *British Burma* (1876); Fytche, *Burma, Past and Present* (1878); Scott ('Shway Yoe'), *The Burman, his Life and Notions* (1882); Sir Arthur Phayre, *History of Burma* (1883); Scott, *Burma as it was, is, and will be* (1886); E. D. Cumings, *In the Shadow of the Pagoda* (1893) and *With the Jungle Folk* (1896); cf. Fielding, *Thebaw's Queen* (1899); and for the railway scheme from India through Burma, Siam, and the Shan States to China, see works by Colquhoun and Holt Hallett.

Burmans, a Dutch family of scholars, originally from Cologne.—(1) Peter 'the elder,' born at Utrecht in 1668, studied law at Utrecht and Leyden, and next travelled through Germany and Switzerland. At first an advocate, he became professor of History and Rhetoric in the university of Utrecht, afterwards of Greek at Leyden, where he died in 1741. In his literary career, his hot temper

and intolerant spirit involved him in many controversies, often with adversaries like Le Clerc and Bentley. His chief works are editions of the Latin classics, in stately quartos, with extensive notes often dreary and tasteless to a degree.—(2) Peter 'the younger,' nephew of the preceding, born in 1714 at Amsterdam, made his studies at Utrecht, and became in succession professor at Franeker, professor at the Amsterdam Athenaeum, and keeper of the public library there. He retired in 1777 on a pension, and died the year after. He edited Virgil, Aristophanes, Claudian, and Propertius, and an anthology of the Latin epigrammatists; but his editions are now little valued.

Bur-marigold (*Bidens*), a widely distributed genus of composite annuals.

Burn, RICHARD, born in 1709 at Winton, in Westmoreland, was educated at Queen's College, Oxford, and in 1736 received the living of Orton, in his native county, which he held till his death in 1785. Among his eight works were the *Justice of the Peace*, which has passed through 29, and *Ecclesiastical Law*, 9 editions; a *History of the Poor-laws*; and a *History of Cumberland*.

Burn, WILLIAM, architect, born in Edinburgh, 20th December 1789, was trained under Smirke, founded a successful business in Edinburgh, and removed to London (1844), where he was equally popular and well employed, and where he died 15th February 1870. Specimens of his work are scattered over the whole kingdom. His 'restoration' of St Giles' Church (1829-33) in Edinburgh was singularly devoid of taste or reverence, and has been as far as possible undone.

Burnaby, FREDERICK GUSTAVUS, a daring traveller and dashing sabreur, was born at Bedford, 3d March 1842. The son of a clergyman and squire of Somersby Hall in Leicestershire, he was educated at Bedford, Harrow, and privately in Germany, and early became a capital linguist. He joined the Royal Horse Guards Blue in 1859, and became captain in the regiment in 1866, lieutenant-colonel in 1880, and colonel in 1881. His travels in Central and South America, his experiences in the Carlist camp in 1874, and with Gordon in the Soudan in 1875, prepared him for the great exploit of his life, his ride to Khiva, in the winter of 1875, across the steppes of Tartary. His brightly written *Ride to Khiva* (1876) at once made him famous; and indeed his great stature, immense strength, and reckless courage, no less than the outspoken frankness of his manners, his hearty patriotic hatred of Russia, and uncompromising Jingoism, were exactly the kind of qualities for a hero of the English people. He contested Birmingham without success in 1880, but polled over 15,000 votes. In 1876 he travelled in Asia Minor and Armenia, publishing on his return, *On Horseback through Asia Minor*, which was no less successful than his earlier book. In Graham's expedition to the Eastern Soudan he was attached to the Intelligence Department, and was badly wounded at El Teh; and in 1884 he made his way without leave to join Sir Herbert Stewart's column in the Nile expedition, and was killed by an Arab spear-thrust in the first battle, that of Abu Klea, 17th January 1885. Burnaby was a daring aeronaut, and crossed the Channel to Normandy in 1882 in a balloon. See his *Life* by Ware and Mann (1885).

Burnand, FRANCIS COWLEY, author and dramatist, was born 29th November 1836. He was educated at Eton and Trinity College, Cambridge (1854-58), and afterwards went to Cuddesdon Theological College with a view to becoming a clergyman of the Church of England. In December 1858 he joined the Catholic Church, and for four months continued his studies at the house of

the Oblate Fathers at Bayswater. His first farce had been produced at Eton in 1851, and at Cambridge he had founded the 'A.D.C.', of which, subsequently, the Prince of Wales became president, and of which Mr Burnand published a *History* in 1879. He was called to the bar in 1862, but the success of some early dramatic ventures altered his plans. He has produced between eighty and a hundred pieces, chiefly extravaganzas and burlesques; four dramas; and some very successful comedies. He joined Mr H. J. Byron in starting *Fun*, but left that paper for *Punch*, then edited by Mark Lemon, in 1863. His first contribution to *Punch* was *Mokeanna*, a burlesque on sensational romance writing; soon after appeared *How, When, and Where*, followed by the now well-known *Happy Thoughts*, which in book form soon ran through over sixteen editions. Later, he continued the *Happy Thoughts* series, and wrote a series of burlesques of popular novelists, that on Ouida's style, *Strapmore*, being perhaps the happiest. Mr Burnand became editor of *Punch* in 1880. He wrote the libretto for Sullivan's *Chieftain* (1894).

Burne-Jones, SIR EDWARD, was born at Birmingham, of Welsh descent, 28th August 1833. He was destined for the church, and educated at Exeter College, Oxford, where William Morris, the poet, was his friend; but his thoughts turned strongly to art; and having, about 1857, submitted some pen-drawings to Rossetti, whose work had powerfully influenced him, he received from this artist encouragement and guidance in his first attempts as a painter. His subjects were always poetical and imaginative. From the first he was a fascinating colourist, and his earlier works, as 'The Merciful Knight' (1864), 'Merlin and Vivien,' the figures of the two heroines of Meinhold's *Sidonius* and 'The Wine of Circe' (1867), along with much mediæval quaintness both in form and feeling, possess great expressional intensity. They attain, in water-colour, greater brilliancy and purity of hue than is usual even in works executed in oil, and are sometimes, as in 'Love among the Ruins' (1873), on such an extended scale as we usually associate with the more dignified medium. About 1870 he began to be known as an oil-painter, and his works of this period are inspired by the earlier art of the Italian Renaissance, and show more of grace and less of emphasis than his former paintings in body-colour. Among his pictures are, 'The Days of Creation,' 'The Beguiling of Merlin,' and 'The Mirror of Venus' (1877); 'Laus Veneris' (painted 1873-75), 'Le Chant d'Amour' and 'Pan and Psyche' (1878); 'The Golden Stairs' (1880); 'The Tree of Forgiveness' (1882); 'The Wheel of Fortune' (1883); 'King Cophetua' (1884); 'Andromeda Chained,' 'The Fight with the Sea-beast,' and 'The Brazen Tower' (1888); and the 'Legend of the Briar Rose' pictures (four, 1890). He became D.C.L. in 1881, A.R.A. in 1885 (resigned 1893), and a baronet in 1894. Several of his latest works show a realism and a thoroughness of draftsmanship and modelling in his treatment of the nude unknown in his former productions; but his colouring tended on the whole to become less splendid. He furnished many striking designs for stained glass—as for Christ Church, Oxford. In 1898 'Love and the Pilgrim' sold for 5000 guineas. He died 17th June 1898.

See monograph by Malcolm Bell (1892); the illustrated *Art Annual* for 1894, by Julia Cartwright; and the authoritative biography by his son-in-law, J. W. Mackail (1900).

Burnes, SIR ALEXANDER, was born in 1805 at Montrose, in Forfarshire, where his father was provost. (The provost's father was the cousin of Robert Burns). In 1821 he entered the Indian

army, and his knowledge of oriental languages gained him rapid promotion. After performing some important missions for the Indian government, he was, at his own suggestion, sent on a twelve-months' expedition into Central Asia. Starting from Lahore in 1832, and adopting the Afghan dress, he passed through Peshawur and Kabul, and crossed the Indian Caucasus to Balkh. Thence he passed on to Bokhara, Astrabad, and Teheran, and journeying through Ispahan and Shiraz, reached Bushire on the Persian Gulf, whence he embarked for India. On his return to England in 1833, he was received with high honours; and in September 1839, having previously been knighted and promoted to the rank of lieutenant-colonel, he was appointed political resident at Kabul, where he was murdered by the Afghan mob, 2d November 1841. See his *Travels into Bokhara* (1834), and *Kabul* (1842); and Kaye's *Lives of Indian Officers* (1869).

Burnet, GILBERT, Bishop of Salisbury, was born at Edinburgh, 18th September 1643. At the age of ten he entered Marischal College, Aberdeen, and, four years later taking his M.A., applied himself to the study first of law and then of divinity, with such diligence and success that in 1661 he was admitted a probationer. In 1663 he visited Cambridge, Oxford, and London, where he met with many of the leading divines of England; and next year passing over into Holland, perfected his knowledge of Hebrew under a learned rabbi of Amsterdam. In 1665 he became minister of Salton, Haddingtonshire; in 1669 professor of Divinity in Glasgow University; but in 1674, having brought on himself the enmity of his old patron Lauderdale, he found it prudent to resign his chair, and settle in London, where he was made chaplain to the Rolls Chapel, and afterwards lecturer at St Clement's. In 1676 he published his *Memoirs of two Dukes of Hamilton*; in 1679-81 the first two volumes of his *History of the Reformation*, which procured him a vote of thanks from parliament; in 1680 *Some Passages in the Life and Death of the Earl of Rochester*; and in 1682 his *Life of Sir Matthew Hale*. The efforts which had previously been made were now repeated to induce him to break with the liberal and moderate party, and to attach himself to the king. He was offered the bishopric of Chichester, but refused it. In 1683 he attended the execution, and vindicated the memory, of his friend Lord William Russell. The king exhibited his unkindly spite by depriving Burnet of his lectureship; and on James's accession he went to the Continent, and travelled through France, Italy, Switzerland, and Germany. In 1684 he was introduced to the Prince of Orange, with whom he became a great favourite, and by whom he was frequently consulted in reference to the great scheme for the deliverance of England. When William came over, Burnet accompanied him as royal chaplain, and in 1689 was appointed Bishop of Salisbury. He entered on the duties of his diocese with great ardour; but his first pastoral letter, in which he founded William's right to the throne on conquest, gave so much offence to both houses of parliament, that they ordered it to be burned by the common hangman. In 1698 he was appointed preceptor to the Duke of Gloucester; in 1699 he published his celebrated *Exposition of the Thirty-nine Articles*, which was condemned as heterodox by the Lower House of Convocation. In 1714 appeared the third volume of his *History of the Reformation*; and on 17th March 1715 he died at Clerkenwell of a pleuritic fever. He was thrice married; his first wife was remarkable for her beauty, the second for her fortune, and the third for her piety. Not until 1723-34 did *Bishop Burnet's History of his Own Time* make its appear-

ance—a work that was sarcastically but foolishly abused by Swift, Pope, Arbuthnot, and other Tory writers of the day. A Whig and broad churchman, Burnet was a man of strict, almost puritanical virtue, of marvellous charity, geniality, and moderation. His style is often harsh, his judgment not always reliable, yet the honesty, earnestness, simplicity, and vigour of his writings, as well as their fullness of details, make his works very valuable to the student of history. Of his two histories good editions have been issued from the Clarendon Press.

Burnet, JOHN, painter, engraver, and author, was born at Fisherrow, near Edinburgh, in 1784, and died at Stoke Newington, 29th April 1868. He first became known through his admirable engravings of Wilkie's works. Of his own paintings the best known is the 'Greenwich Pensioners' (1837). He wrote several books on art, the most important being a *Practical Treatise on Painting*; and he was also author of *Rembrandt and his Works* (1849), and, in conjunction with Cunningham, of *Life and Works of Turner* (1852).

Burnet, THOMAS, born in Yorkshire about 1635, studied at Cambridge, and in 1685 was elected Master of the Charterhouse. He succeeded Archbishop Tillotson as clerk of the closet to William III., but having in 1692 published a work, *Archæologia Philosophica* (also in English), displaying great learning, but treating the Mosaic account of the Fall as an allegory, he was obliged to retire from the clerkship, and lived in the Charterhouse till his death in 1715. His *Telluris Theoria Sacra* (1680-89) was written in Latin, but translated, or rather recomposed in English, by the author. It is an ingenious speculation, written in ignorance of the facts of the earth's structure, and is therefore a mere system of *cosmogony*, and not geology. But it abounds in sublime and poetical conceptions and descriptions, and called forth the highest applause at the time. See *Life* by Heathcote prefixed to the seventh edition of the *Theory* (1759).

Burnet, the English name of two closely

[*Sanguisorba*] *officinale*) is common in meadows in all parts of Europe. It is cultivated in Germany on poor soils for fodder. The root-stock is astringent, and was formerly used in medicine.—Common Burnet (*Poterium Sanguisorba*) grows in dry pastures, especially on chalky soils, on which it sometimes becomes of importance, and has also been cultivated as a fodder plant. It grows wild in the United States. It used to be cultivated in gardens, its slightly astringent leaves being used in salads or soups, also as an ingredient in *cool tankard* (the name *Poterium* being from a Greek word signifying a drinking-vessel). *S. Canadensis* is an interesting American species sometimes cultivated in gardens.

Burnet-saxifrage (*Pimpinella Saxifraga*) is an umbelliferous plant, which, on account of its similar foliage, habit, use as fodder, and (more distinctly) astringent root-stock, has been associated or confused with burnet from the earliest times.

Burnett, FRANCES HOBGSON, novelist, was born at Manchester, November 24, 1849. About the close of the American civil war she emigrated with her parents to the United States, and settled in Tennessee. She married Dr Burnett in 1873, and after a lengthened tour in Europe, settled in Washington. She had early begun to write, but her first great success was her story, *That Lass o' Lowrie's*, which, after running through *Scribner's Magazine*, was issued at New York in 1877. Her second story, *Haworth's*, appeared in 1879. Both were novels of no common power, studies of Lancashire manufacturing life. The earlier of the two startled the reading public by its freshness and reality, no less than by a simple pathos and a delicate humour that recalled the touch of Mrs Gaskell. *A Fair Barbarian* (1882) and *Through One Administration* (1883) were later novels; *Louisiana* (1880) and *Little Lord Fauntleroy* were admirable minor tales; *The one I knew best* (1893) is autobiographical; *A Lady of Quality* (1896) and *His Grace of Ormonde* (1897) are novels.

Burnett, JAMES. See MONRODDO.

Burnett Prizes, two theological premiums founded by bequest of John Burnett (1729-84), an Aberdeen merchant. Part of his fortune was to be accumulated for forty years at a time as a prize-fund to the authors of the two best treatises on 'The evidence that there is a Being all-powerful, wise, and good, by whom everything exists; and particularly to obviate difficulties regarding the wisdom and goodness of the Deity; and this independent of written revelation, and of the revelation of the Lord Jesus; and from the whole to point out the inferences most necessary and useful to mankind.' On the first competition in 1815, 50 essays were given in; and the judges awarded the first prize, £1200, to Dr W. L. Brown, Principal of Aberdeen University; the second, £400, to the Rev. J. B. Sumner, afterwards Archbishop of Canterbury. In 1855, 208 essays were given in; and the first prize, £1800, fell to the Rev. R. A. Thompson, for an essay entitled *Christian Theism*; the second prize, £600, to Dr Tulloch, afterwards Principal of St Mary's College, St Andrews, for an essay on *Theism*. The four essays were published. The fund has since been applied to found a lectureship on some branch of science, history, or archaeology, illustrative of natural theology. The first lectures under the new scheme, *On the Nature of Light*, were delivered at Aberdeen, in November 1883, by Professor Stokes of Cambridge, and published in 1884.

Burnett's Disinfecting Liquid is a liquid introduced by Sir William Burnett (1779-1861) for the purpose of deodorising the bilge-water of ships, sewage-water, &c. It is a strong solution (sp. gr. 2)

1, Common Burnet (*Poterium Sanguisorba*);
2, Great Burnet (*Sanguisorba officinale*):
a, a floret; b, flower-head.

allied and often united genera of Rosaceæ—*Poterium* and *Sanguisorba*.—Great Burnet (*Poterium*

of chloride of zinc, accompanied by a small amount of chloride of iron; and when intended to be used, it is mixed with water in the proportion of one pint to five gallons of water. The liquid acts only as a *deodoriser* and *antiseptic* (see ANTISEPTICS), and does not yield any vapour which can exhibit the properties of a Disinfectant (q.v.). It is of service in preserving dead animal tissues, as in the dissecting-room, and in jars containing anatomical specimens. It is said to have little action on dissecting knives, but this is doubtful. When added to bilge or sewage water, the chloride of zinc, $ZnCl_2$, mainly acts by decomposing the offensive sulphide of ammonium, NH_4HS , which it does by forming the sulphide of zinc, ZnS , and chloride of ammonium, NH_4Cl , both of which are odourless. The strong solution of chloride of zinc has also been applied to the preservation of timber from the ravages of dry-rot, and the process of so treating wood is called, after its inventor, *Burnettising*. *Creue's* disinfectant liquid is chemically the same as the above.

Burney, DR CHARLES, musician and author, was born in 1726 at Shrewsbury, and having studied music there, at Chester, and under Dr Arne in London, he commenced giving lessons in music himself. After composing three pieces—*Alfred*, *Robin Hood*, and *Queen Mab*—for Drury Lane (1745–50), he settled as organist at Lynn, in Norfolk (1751–60), where he planned his work on the *History of Music*. In 1770–72 he travelled in France, Italy, Germany, and Austria, collecting materials for that work, which appeared in 4 vols. (1776–89). Beside minor works, and accounts of his two tours, Burney wrote a *Life of Metastasio*, and nearly all the musical articles in *Rees's Cyclopædia*. In 1783 he became organist to Chelsea Hospital, where he died 12th April 1814. He knew intimately many of the most eminent men of the day, including Edmund Burke, Dr Johnson, Reynolds, and Garrick. See the *Life* (1832) by his famous daughter Fanny, Madame D'Arblay (q.v.).—His son, CHARLES BURNEY, D.D. (1757–1817), was a schoolmaster and classical critic. His fine library was purchased for the British Museum for £13,500.

Burnham Beeches, the remains of an ancient forest in Buckinghamshire, 25 miles W. of London. The London Corporation purchased the surrounding 374 acres in 1879, and set them apart for public use, 3d October 1883. The poet Gray, early in the 18th century, first called attention in his letters to the wild woodland. Many of these beeches have been, and still are, of immense size. Mr F. G. Heath, who was the first to urge their acquirement for public use, has described them in *Burnham Beeches* (1880).

Burning, CHEMISTRY OF. See COMBUSTION. For BURNING-GLASSES, see HEAT, LENS, and MIRROR.

Burning Bush (*Euonymus atro-purpureus*) is a small ornamental shrub of North America, with oblong leaves, deep purple flowers, and scarlet smooth capsules; its congener, *E. americanus*, has scarlet prickly capsules. The French *Buisson ardent* is a red hawthorn (*Crataegus Pyracantha*).

Burnley, a thriving town of Lancashire, in a narrow vale on the banks of the Brun, near its influx to the Calder, 21 miles E. of Preston, and 27 N. of Manchester. A great seat of the woollen and then of the cotton manufacture, it is a modern, well-built place, with a literary institute and exchange (1855), a market-hall (1868), the Victoria Hospital (1886), a grammar-school (*temp.* Edward VI.), and an ancient parish church, restored in 1856. Besides numerous cotton-mills, it has calico-printing works, iron and brass foundries, machine-shops, breweries, tanneries, and rope-works. There are collieries in the vicinity. Burnley was created

a municipal borough in 1861, a parliamentary borough (returning one member) in 1867, and a county borough in 1888. Pop. (1871) 44,320; (1881) 63,638; (1891) 87,016. A Roman way passed through the town, and Roman remains have been found.
